Percolation experiments indicate that maceration before or after packing is of no advantage in promoting more rapid extraction of powdered belladonna root. When the amount of moistening liquid is not kept down to a low proportion there is a decrease in rate of extraction. No advantage is apparent in (a) vacuum maceration, or (b) preliminary maceration with water alone, with subsequent addition of alcohol.

PHYTOCHEMICAL NOTES *

NO 113 AN UNUSUAL PEPPERMINT OIL

BY SISTER M FRANCIS LAVIER

As a preliminary to the study of a number of *Mentha* materials, largely hybrids of which only small amounts were available, a lot of about 370 cc of peppermint oil

* From the Laboratory of Edward Kremers

1930, was examined The oil had been distilled by A J Schwarz and E Baillie, August 11, 1930, from material harvested from the strain of *Mentha piperita* L which has been raised in the Pharmaceutical Garden of the Wisconsin Pharmaceutical Experiment Station for a number of years under the direction of Professor W O Richtmann

In October 1931, the oil had acquired a decided orange tint, was cloudy and had deposited a resinous sediment Nevertheless, the odor was still pleasant though penetrating After the physical and chemical constants had been determined, the bulk of the oil was rectified by steam distillation, 307.8 Gm yielded 269.8 Gm of practically colorless rectified oil, or a yield of 87.6 per cent The aqueous distillate, approximately three liters, was twice cohobated, yielding 6.7 cc and 4.0 cc, respectively, of oil Added to the original rectified oil, the total amounts to 279.62 Gm or 90.8 per cent There remained, therefore, 9.2 per cent of non-volatile resinous material in the distillation flask The acid value of this resin, recovered from the dried ethereal solution, was found to be 3.1, 2.6 and 2.7, respectively, in three determinations So far as determined, the physical and chemical constants of the three oils are herewith tabulated

	Crude Oil	Rectified Oil	First Cohobate
<i>d</i>	0.9620 at 25°	0.9145 at 27°	0.9179 at 25° (1)
<i>n_D 20°</i>	1.4721	1.4700	
<i>α_D</i> in 100 mm tube	-32°	-9.42°	
Acid value	0.6		
Ester value	23.5 and 22.4	28.2	
Percentage ester	8.5% and 8%	10.1%	
Combined menthol	6.39%	7.8%	
Total menthol	55.40%	45.3%	
Free menthol	49.01%	37.5%	

Inasmuch as the U S P states that the density of the official oil may vary between 0.896 and 0.908 at 25°, the oil must be regarded as an unusual product Letters were, therefore, sent to the A M Todd Company of Kalamazoo, Mich., and to Fritzsche Bros of N Y City inviting their comments The Michigan distillers asked for a sample of the oil which was sent The replies of both firms are herewith quoted with running comments in the form of foot-notes To the data reported by the A M Todd Company the U S P requirements were added in the table to admit of ready comparison

'We do not think the sample is true *Mentha piperita*, as we know it, and its odor strongly suggests to us some type of horsemint (2) It resembles to some extent oils raised in Oregon and Washington from *Mentha piperita* but the constants are quite different than anything purporting to be Oil of *Mentha piperita* we have ever examined We assayed a part of the sample you sent to us and below we give you both the analysis of your own oil and an average analysis of 1930 crop Peppermint raised in Michigan

	Your Sample	Average 1930 Crop	U S P Requirement
Optical rotation	-7.62/25°	-25.50/25°	Varies between -23° and -33°/25°
Specific gravity	0.9166/25°	0.9001/25°	0.896 to 0.908/25°
Solubility	Insoluble in 70% alcohol Soluble in 1:1 vol 80% alcohol	3 vol 70% alcohol 4 vol 70% alcohol slightly opalescent	Soluble in 4 vol 70% alc showing not more than a slight opalescence and no separation of oil globules

Ester	10 72%	7 8%	Not less than 5%
Total menthol	41 65%	52 7%	Not less than 50%
Refractive index	1 4705/20°	1 4620/20°	1 4600 to 1 4710/20° C

"The temperature at which the Optical Constants have been taken is indicated. You will note a difference of about two points (0.002) in the Specific Gravity you quote, 0.9145/27°, and the Specific Gravity our laboratory indicates (3). In checking Gravity in our laboratory a pycnometer is used and a correction of 0.00075 is calculated per 1° C in temperature. Refractive Index we find to be a dependable Constant and it seldom, even on very weedy (4) Peppermint, runs as high as 1.4630/20°. I think we have never seen a sample purporting to be Oil of Peppermint with as high a Refractive Index as the sample you submitted nor as low Optical Rotation. If the oil is true *Mentha piperita*, it is most abnormal in all respects."

Fritzsche Brothers returned two opinions: the first from the Clifton Chemical Laboratory, Clifton, N. J., the second from the Chemical Laboratory of Schimmel & Co. Milititz b Leipzig, Germany. Both are herewith quoted.

'The Peppermint Oil to which Prof. Kremers refers appears to be quite an unusual product. While the oils of 1930 generally have been higher in density than in former years, i. e., 0.900 to 0.904, we never had any above 0.905.

"The keeping quality was very good, three samples from different sources showed a rise in density of only one point in the third decimal in each case after one year's standing."

'Wir bestaetigen Ihnen den Empfang Ihres Schreibens vom 6. d. M. und haben auf die Ausfuehrungen von Herrn Prof. Kremers zu bemerken, dass wir in den letzten drei Jahren an amerikanischem Pfefferminzoeel spezifische Gewichte bis zu 0.905 (25°/25°) beobachtet haben. Das will aber bei der verhaeltnismaessig geringen Anzahl von Oelen, die wir untersucht haben, nicht viel besagen und schliesst keineswegs aus, dass auch hoehere spezifische Gewichte vorgekommen sind. Jedenfalls halten wir ein spez. Gewicht von 0.911, wie es Herr Prof. Kremers an einem von ihm selbst destillierten Oel festgestellt hat, nicht fuer zu hoch, da nach den vorliegenden Beobachtungen bei amerikanischem Pfefferminzoeel tatsaechlich spezifische Gewichte bis zu 0.915 und darueber vorkommen. Dass der von der U. S. Ph. angegebene obere Grenzwert von 0.908 zu niedrig ist, haben wir bereits bei Besprechung des amerikanischen Arzneibuchs erwaehnt (Report 1926, 139) und gehen heute sogar noch einen Schritt weiter, indem wir als obere Grenze nicht 0.910 sondern 0.915 vorschlagen.

"Die Zunahme, die das spezifische Gewicht des in Rede stehenden Oels innerhalb Jahresfrist erfahren hat (von 0.911 auf 0.962), ist allerdings ziemlich gross und laesst auf starke Verharzung schliessen, die ja auch in dem hohen Rektifikationsrueckstand (12%) zum Ausdruck kommt. So starke Verharzungen kommen bei Pfefferminzoeel besonders dann vor, wenn das verarbeitete Kraut sehr frisch gewesen ist, weil in diesem Fall leicht verharzende Bestandteile in das Oel hineingelangen, die bei vorherigem Trocknen des Krauts durch den Sauerstoff der Luft schnell in nicht fluechtige Harze ueberguehrt und dadurch unschaedlich gemacht werden (5). Es soll damit nicht ohne weiteres behauptet werden, dass dies hier der Grund ist, vielmehr kann die Verharzung auch eine reine Zufallserscheinung sein, fuer die jede naechere Erklaerung fehlt, denn es ist ja bekannt, dass unter sonst gleichen Bedingungen das eine Oel groessere Neigung zum Verharzen zeigt als das andere, und das wird sich dann im Verlauf eines Jahres immerhin schon recht deutlich bemerkbar machen. Eine direkte Anomalie koennen wir selbst in einer starken Verharzung nicht erblicken, und ebensowenig darin, dass das spezifische Gewicht nach der Rektifikation des Oels hoeher bleibt als es urspruenglich gewesen ist, denn die Verharzungsprodukte sind natuerlich z. T. fluechtig und machen dann begreiflicherweise das Oel schwerer (5)."

In order to acquire a somewhat better insight into the nature of this unusual oil, 130 cc. of the rectified product were saponified and the saponified oil distilled with steam. The oily distillate (116 cc.) was collected in fractions, the volumes and densities of which are herewith recorded.

Fraction	Volume	d_{22}°
I	60 cc	0 9060
II	9 cc	0 9174
III	47 cc	0 9112

Thus it becomes apparent that little more than one-half of the saponified oil has a density within the specific gravity limits of the Pharmacopœia. Subjected to fractional distillation, the bulked rectified oil yielded the following results

Fraction	Volume	d_{25}°
-165°	1 0 cc	
165-185°	1 2 cc	0 7646
185-200°	13 0 cc	0 9119
200-220°	63 0 cc	0 9171
220-240°	15 0 cc	0 9144
Residue	12 0 cc	

Again it will be seen that the three larger fractions of the saponified (!) oil have densities greater than those of the pharmacopœial limits

Fraction 200° to 220°, when placed in a freezing mixture, yielded crystals of menthol. Acetylation revealed the presence of 97.8% alcohol computed as menthol.

The absence of thymol and carvacrol has already been pointed out. The quantitative tests for pulegone likewise gave negative results (6).

This unusual oil shows once more how difficult it is to fix standards for volatile oils that will satisfy every one, even though the oil be a rectified product. Had the oil been of lighter density than the official lower limit, such a shortcoming could be corrected, even though with a loss, by the removal of some of the lower fractions. However, inasmuch as the density is too high, a corresponding correction might have involved a loss of menthol and menthol ester, unless the solubility tests reported by Todd indicate the presence of sesquiterpenes that could be removed. Should the peppermint grower find that a large share of his crop yields such an oil as here reported, about the only thing he can do under the present U. S. P. standard is to blend it with other oils that are relatively light.

REFERENCES

(1) The first cohobated oil had separated into two portions: one floated on the aqueous distillate, the other was heavier than water. The latter was discarded after it had been ascertained by means of the Flueckiger test that it contained neither thymol nor carvacrol.

(2) As already stated, the oil had been distilled from plants that have been under cultivation in the Pharmaceutical Garden for a number of years. Inasmuch as both horsemint and wild bergamot have been distilled repeatedly in the same still used for field operations, there was a bare possibility that contamination with the oil of either species of *Monarda* had taken place. However, this was excluded by making a Flueckiger test for thymol and carvacrol. The result was negative.

(3) Applying as correction for the difference in temperatures the factor 0.000755 (Schreiner), the Specific Gravity will be 0.91601/25°. Accordingly, the difference is only 0.00059, when comparison is made at the same temperature.

(4) Contamination with weeds is excluded, since the peppermint is cultivated in rows that are kept free from weeds. Should a single weed plant have been overlooked during the cultivation, this may be expected to have been discarded in the harvest. The Pharmaceutical

Garden has only a half acre experimental field of peppermint, hence, both cultivation and harvest are under rigid control

(5) This explains satisfactorily the large amount of resin resulting upon rectification but does not account for the unusually high density of the rectified oil

THE CHEMISTRY OF HEPTANE AND ITS SOLUTIONS *¹

NO 6 THE SOLUBILITY OF THE HALOGENS IN HEPTANE

BY JOSEPH SEMB

The heptane used was that prepared from some of the by-products obtained in the purification of hydrocarbon from Jeffrey Pine oil placed at the disposal of this laboratory in 1927 by the Ethyl Gas Corporation (1) The material employed (2) was first shaken with concd sulphuric acid until no more charring occurred (loss 30 per cent) Next the oil was shaken with fuming sulphuric acid and allowed to stand over night After that it was shaken successively with water, also with aqueous solutions of sodium carbonate, sodium hydroxide and potassium permanganate Finally, it was dried with calcium chloride, refluxed for several hours over metallic sodium and distilled over phosphorus pentoxide The bulk of the oil distilled within two degrees, *viz*

550 cc between 96.8° and 97°

550 cc at 97°

550 cc between 97° and 97.4°, barometric pressure 743 mm The 'Vorlauf' and residue amounted to 200 cc

The chlorine (from a cylinder) used was purified by passing it through aqueous copper sulphate, water, concd sulphuric acid and finally through a calcium chloride tower

The bromine used was Merck's C P article

Merck's U S P iodine was used without additional purification

The dissolved halogen was determined directly with standard sodium thio-sulphate (standardized against potassium dichromate) in the case of iodine In the case of chlorine and that of bromine, the iodine equivalent was set free by the addition of potassium iodide

Bromine Heptane Solution		Iodine Heptane Solution

* The accompanying figure shows that the weights determined at -51° and at -32° are off

The above values are plotted on Fig 3

* Scientific Section, A P H A, Madison meeting 1933

¹ From the Laboratory of Edward Kremers

In this work the concentrations are reported in grams of halogen per 100 cc of solution (not solvent). However, the weights of 5-cc aliquots of the saturated bromine and iodine solutions were determined at different temperatures. The data are recorded below. These values together with those reported in subsequent tables makes it possible to calculate the solubilities on the gram or mole fraction basis.

Approximately 5 cc of heptane, placed in a 25-cc graduated cylinder and kept as remote from light as possible, were saturated with chlorine at the temperature stated, by bubbling the gas through the solvent. When the solution was saturated (15 to 30 minutes, depending on the temperature of experiment) the new volume was recorded. This was then diluted with heptane that was colder than the solution. This tended to cut down the amount of chlorine that might otherwise escape during the subsequent steps of transferring and titrating. It also diminished the losses due to reaction between the chlorine and the heptane.

In experiments Nos 12, 13, 15, 16, 18, 20, 21, 24 and 25, Table I, all of the diluted solution was dumped into an Erlenmeyer flask and titrated. It is significant to note that in the above series the low temperature experiments gave low results. The other experiments reported in Table I were carried out somewhat differently. Not only was the original volume of the saturated solution recorded but also the volume of the diluted solution. A 5-cc aliquot of this diluted solution was withdrawn and titrated. From these data the grams of chlorine dissolved in 100 cc of solution were calculated and recorded in column "C," Table I. The values chosen for plotting on Fig 1 are found in column "D."

In Table I, it will be observed that numerous experiments gave low results, particularly so for the low-temperature ones. This is probably due to one or both of two possibilities. Firstly, the solution may not have been saturated to start with, or if it had been, too much chlorine was lost in subsequent operations. Naturally, the higher the concentration of chlorine the more acute this danger becomes. In the second place, as chlorine and heptane do react, and as the increased concentration is favorable to secondary reactions, the discrepancy due to thermal secondary reactions, initiated by a photochemical reaction, should be greater at the higher concentrations of the lower temperatures. Several times, without apparent provocation, the reaction between chlorine and heptane became so violent that the experiment was lost. Usually this took place for the higher concentrations, and then when the gas had been bubbled through for a considerable period. This would indicate that the accumulation of HCl or probably heptyl chloride catalyzes this thermal reaction between chlorine and heptane. The data in column "E," Table I seem to verify these assumptions. Take, for instance, in experiments Nos 5 and 6, the amounts of HCl found were small. Therefore, the low chlorine yield was not due to losses arising from the reaction between the chlorine and heptane, but the solution was probably unsaturated when removed from the saturating chamber.

In experiments Nos 12 and 13, Table I, it will be noted that the amount of chlorine found is low, but that the amount of HCl found ("E") is very high. This would indicate that the heptane had been saturated with chlorine, and that the subsequent reaction between the chlorine and the heptane, with the formation of HCl and the liberation of heat, decreased the chlorine content.

The HCl was determined as follows. After the chlorine had been titrated as stated above the free HCl was titrated with standard NaOH using 1 methylcne blue phenolphthalein indicator. To establish whether $\text{Na}_2\text{S}_2\text{O}_3$ ($\text{H}_2\text{S}_2\text{O}_3$) or $\text{Na}_4\text{S}_2\text{O}_6$ ($\text{H}_2\text{S}_2\text{O}_6$) had any effect on this titration the following experiment was conducted. A solution containing I_2 was titrated with $\text{Na}_2\text{S}_2\text{O}_3$. To this was added 1 cc of HCl solution equivalent to 9.25 cc of 0.0818*N* NaOH. Three different titrations gave 9.38, 9.35, 9.05 cc of 0.0818*N* NaOH or an average of 9.26 cc. Hence, for this work at least, the presence of the above named compounds does not hinder the titration of HCl with NaOH.

Taylor and Hildebrand (3) reported the solubility of chlorine in grams per 1 Gm. of solution at 0° to be 0.196, 0.205, 0.210 or an average of 0.2036 Gm. These investigators obtained erratic values at 20° and 40°, therefore they did not report these values. As I have reported my solubilities in grams per 100 cc. of solution an exact comparison is not possible.

When 10 cc. of bromine were added to 10 cc. of heptane, there was but one liquid phase. It is, therefore, assumed that bromine is miscible with heptane at

Fig 1 ——— Bromine (unbroken line) — — — Chlorine (broken line) — — — Iodine (dots and dashes)

Fig 2 ——— Bromine (unbroken line) — — — Chlorine (broken line) — — — Iodine (dots and dashes)

room temperature. Inasmuch as bromine congeals at low temperatures and melts at -7.3° , the bromine solutions were exposed to low temperatures and the solubility of the halogen in heptane determined. This was done by immersing a solution of bromine in heptane, in a test-tube, into a Dewar flask, cooled to the desired temperature by means of acetone and solid CO_2 . The data obtained are recorded in Table II and plotted on Figs 1 and 2. 2-Cc. aliquots were used in the determinations. The solubility of iodine was determined in a similar manner except that a Dewar flask was not used. The values obtained for iodine are reported in Table III and plotted on Figs 1 and 2.

From Fig 2 it will be noted that for both the bromine and the iodine, plotting $1/T$ against the log of the concentration, gives practically a straight line up to a

certain temperature, whereas in the case of chlorine a distinct curve is obtained. In the case of bromine this temperature is about -40° and for iodine about $+40^{\circ}$. This indicates that the heat of solution of bromine and iodine is practically independent of temperature within this temperature range and that, in the case of the chlorine, the heat of solution varies appreciably with the temperature throughout the range studied.

The molecular heats of solution of iodine, and bromine, in the region where the heat of solution is practically independent of temperature, were calculated by means of the formula,

$$\text{Log } C_2 - \text{Log } C_1 = \frac{Q}{4581} \left(\frac{1}{T_1} - \frac{1}{T_2} \right)$$

C_1 and C_2 are the concentrations, respectively, at temperatures T_1 and T_2 . Q is the heat absorbed, or $-Q$ is equal to the heat of solution. It is assumed that Q remains constant within this temperature range, a condition which is fairly well satisfied in the case of the iodine and bromine. The molecular heat of solution for bromine thus calculated was -4700 calories and for iodine -5940 calories. The molecular heat of solution of chlorine was calculated by the same formula, choosing for T_1 and T_2 20° and 40.5° (Q is not independent of the temperature in this region) and found to be 5200 calories.

The fact that bromine and iodine give a negative heat of solution and chlorine a positive value is accounted for in that heat is required to sublime the iodine and bromine while heat is given off when the chlorine gas is condensed.

Fig 3 ——— Bromine (unbroken line) --- Chlorine (broken line) - - - Iodine (dots and dashes)

Hildebrand and Jenks (4) report the solubilities of iodine in heptane to be 0.6176, 1.702, 2.491 and 4.196 Gm. per 100 Gm. of solution at 0° , 25° , 35° and 50° , respectively. When Figs. 1 and 3 are greatly enlarged, the solubilities of iodine per 100 Gm. of solution were computed by interpolation to be 0.66 Gm. at 0° , 1.71 Gm. at 25° , 2.39 Gm. at 35° and 4.06 Gm. at 50° .

20 0	0 003413	1 00	0 0000

While working with these solutions, it seemed desirable to ascertain something of their reactivity with other elements. In making comparisons, it should be borne in mind that the iodine solution, because of the sparing solubility of this halogen, was but one-fifth as strong, as to molecular equivalent, as were the two other solutions. Moreover, it will also become apparent from some of the reactions to be reported, that the solutions of chlorine and bromine contained some of their hydrides as well, resulting from the action of these halogens on heptane in spite of the precautions taken.

Of the elements of the first group, lithium, sodium and copper (foil) were used. The chlorine and bromine solutions yielded bubbles with both lithium and sodium, indicating the presence of hydrogen chloride and of hydrogen bromide in the respective solutions. After standing over night, the halogen had disappeared completely or nearly so. When a freshly prepared solution of chlorine in heptane, saturated at considerably below 0°, was added to finely powdered copper the two elements reacted with the phenomenon of flame. Upon repeating the experiment with the solution which had been kept in an ice bath for several hours, no such phenomenon occurred. The disappearance of the color of the chlorine showed that it had reacted with the solvent.

The phenomenon of flame is produced when chlorine gas is brought in contact with phosphorus, copper, boron and silicon in powder form. As has been shown, chlorine in heptane solution produces like phenomena with red phosphorus and powdered copper.

The effect of chlorine hydrate upon red phosphorus and powdered copper was also tried, but with negative effect so far as the phenomenon of flame was concerned.

Of the elements of the second group, calcium (lumps), magnesium (turnings), cadmium (lumps) and lead (powder) were tried. Calcium yielded bubbles with Cl and Br, indicating the presence of HCl and HBr, respectively. Mg and Cd apparently were affected but little by Cl. The other two elements seemed to have no effect. Pb decolorized the solutions of all three halogens.

Of the elements of Group three, Al (ribbon) only was tried. With Cl bubbles

were produced Br and I produced a brown, tar-like deposit The I also produced fumes of HI

Of the elements of the fifth group, P, Sb and Bi were used With Cl the P burst into flame immediately as stated in connection with copper The bromine solution was decolorized the next morning, the I sol was partly decolorized Sb decolorized the Cl solution immediately, the Br solution was almost colorless the next morning, the I solution partly decolorized Bi did not seem to react

In several instances colorless crystals were obtained (NaCl , NaBr , SbCl_3), in other instances the bright surface of the metallic element was dulled (in the bromine experiment the Cu became black), in still other instances a tar-like product was deposited (AlBr_3)

It may be of interest to note that of the metallic elements sodium appeared more reactive than lithium, and cadmium more than zinc On the other hand in Group five, P was much more reactive than Sb and Bi Also, that, with the possible exception of Cu, the order of reactivity of the halogens proved to be Cl, Br, I, as was to be expected

THERAPEUTIC SUBSTANCES DERIVED FROM UNSYMMETRICAL DIPHENYL COMPOUNDS III SOME ARYL ESTERS OF THE HYDROXY DIPHENYLS *

BY S E HARRIS AND W G CHRISTIANSEN ¹

Numerous references have appeared in the literature describing the use of aryl esters of phenol and cresols as urinary and intestinal antiseptics In extending our survey of diphenyl compounds it was decided to prepare a number of aryl esters of 2-, 3- and 4-hydroxy-diphenyls and some of their substitution products

The three hydroxy diphenyls, (*o*-, *m*- and *p*-phenyl-phenol) and their alkyl and halogen substitution products are active, non-toxic germicides and it was hoped that by oral administration in the form of an ester they might reach the urine unmetabolized, and there exert the required germicidal action Fifteen esters were prepared and tested Results of animal experiments definitely show that they possessed no value as urinary antiseptics

* Scientific Section, *A Ph A*, Washington meeting, 1934

¹ Research Department of the Chemical and Pharmaceutical Laboratories, E R Squibb and Sons, Brooklyn, N Y

The tests were carried out upon rabbits, to which the esters, dissolved in olive oil, at a dose level of 20 mg /Kg, were administered orally twice daily for five or six consecutive days. The urine was collected from the second day on and examined for germicidal activity, following in general the procedure of Leonard (1) except that the samples were diluted as required and plated for count immediately after culture, and after 24 hours' contact.

Early results led to the belief that some of the esters possessed activity, but it was later discovered that the urine of the animals varied in activity, and in many cases the urine of untreated controls was germicidal. The variations were correlated with the diet and p_H of the urine, and in later work the p_H was adjusted to 6.5-7.5 (quinhydrone electrode). The effect of p_H adjustment upon the germicidal results is shown in the following tables. 63 urine specimens were collected from rabbits which had been on a uniform diet of hay and oats for some time.

I p_H Distribution

p_H		Below 6.5	6.5-7.5	Above 7.5
No. of urine specimens		23	16	24

II Tested against *B. coli* and *Staphylococcus aureus*

(a) p_H Below 6.5	Below 6.5		6.5-7.5		Above 7.5	
	No. of Specimens Tested	No. Showing Germicidal Activity	No. of Specimens Tested	No. Showing Germicidal Activity	No. of Specimens Tested	No. Showing Germicidal Activity
<i>B. coli</i>	21	8	14	1	22	13
<i>Staph.</i>	21	4	14	1	22	17

(b) p_H	Below 6.0		Above 8.0	
	No. of Specimens Tested	No. Showing Germicidal Activity	No. of Specimens Tested	No. Showing Germicidal Activity
<i>B. coli</i>	8	4	18	14
<i>Staph.</i>	8	3	18	16

18 normal urine specimens with p_H below 6.5 or above 7.5 were then adjusted by NaOH or HCl to a value between 6.5 and 7.5. None of these adjusted samples showed any germicidal or antiseptic activity against the test organisms.

Further tests of the esters, in which the p_H of the urine samples was adjusted before test, confirmed the statement made above that the esters were not of value as urinary antiseptics.

Therapeutic activity was expected to result from liberation of the free phenol by hydrolysis of the esters in the body. Phenols, while sometimes excreted in part as glucuronates or even unchanged, are usually metabolized by the potassium salt of their acid sulphuric esters (2). These esters are stable in alkaline but not in acid solutions. The acid sulphuric esters of two of the most active phenols, Potassium 4-*n*-propyl-2-phenyl-phenyl sulphate (I) and Potassium 6-chloro-2-phenyl-phenyl sulphate (II) were prepared, tested *in vitro* and were found to be quite inactive.

In an alkaline or neutral urine such salts as these would represent the condition of phenol, whereas the free phenol would be expected in an acid urine. The absence of germicidal action in acid urines seems to indicate that the esters are not excreted after hydrolysis and combination with sulphuric acid, but that they pass through without material change.

In planning the work which has been outlined, we included one compound not of the diphenyl series—the benzoate of 5,7-dichloro-8-hydroxyquinoline. It is here included for purposes of record.

EXPERIMENTAL

The several compounds, with their corresponding crystallizing media, their melting points and analyses, are listed in the accompanying table. The esters were prepared by several methods, an example of each being detailed below. Excellent yields were obtained.

1 SCHOTTEN BAUMANN METHODS

3 Phenyl-Phenyl Benzoate—42 Gm *m* phenyl phenol, 43 Gm benzoyl chloride and 50 cc 35 per cent sodium hydroxide were mixed with 150 cc water and shaken mechanically until the odor of benzoyl chloride had disappeared. The precipitated ester was filtered off, washed with water and dissolved in alcohol. Upon spontaneous evaporation of the alcohol the ester was deposited in fine crystals *m p* 57–58° C (corr).

2 ACTION OF ACID CHLORIDE ON THE PHENOL IN A SOLVENT

2 Phenyl-4 Chlorophenyl Benzoate—40 Gm 2 phenyl-4 chlorophenol and 30 Gm benzoyl chloride were dissolved in 200 cc toluene and refluxed until the evolution of hydrochloric acid ceased. The solution was cooled and washed with dilute sodium hydroxide and water. After drying with anhydrous calcium chloride the toluene was removed under reduced pressure and the residue crystallized from methyl alcohol, *m p* 83.5° C (corr).

3 ACTION OF ACID CHLORIDE ON THE PHENOL IN BENZENE WITH POTASSIUM CARBONATE

5,7-Dichloro-8 Hydroxy Quinoline Benzoate—25 Gm 5,7-dichloro-8-hydroxyquinoline, 17 Gm benzoyl chloride and 50 Gm anhydrous potassium carbonate (100 mesh) were dissolved in 250 cc benzene. The mixture was refluxed and stirred for five hours. It was then treated for one half hour with decolorizing carbon and filtered from excess potassium carbonate and potassium chloride. The precipitate was washed with hot benzene and the filtrate and washings combined. They were then washed with 5 per cent sodium hydroxide and with water and dried with calcium chloride. The solvent was distilled off and the residue recrystallized from alcohol, *m p* 129.5–130.5° C (corr).

4 REACTION BETWEEN THE ACID CHLORIDE AND THE PHENOL IN PYRIDINE

2 Phenyl-Phenyl Acetyl Salicylate—14.7 Gm 2 phenyl phenyl salicylate were dissolved in 12 Gm dry pyridine by the aid of heat and the solution cooled in an ice bath. To the resulting suspension 5 Gm acetyl chloride were added dropwise and the reaction completed by warming on the water-bath for thirty minutes. The mixture was then poured upon ice and the resulting sticky product washed with water. It was recrystallized from alcohol until constant *m p* was reached. Consistently low yields of about 40% were obtained.

5 ACID PHENOL AND PHOSPHORUS TRICHLORIDE OR PHOSPHORUS OXYCHLORIDE IN TOLUENE

2-Phenyl Phenyl Benzoate—0.2 mol 2 phenyl phenol and 0.2 mol benzoic acid were dissolved in 400 cc toluene and heated under reflux. The solution was stirred mechanically to promote even boiling. 0.1 mol phosphorus oxychloride was added slowly and the refluxing and stirring continued until evolution of hydrochloric acid ceased. (This varied from three to eight

hours in various cases) The solution was then cooled, decanted from the phosphoric acid, and washed with dilute sodium hydroxide and with water After drying with calcium chloride the toluene was removed under reduced pressure and the residue crystallized from methyl alcohol as prisms, m p 75° C

Preparation of Potassium 4-n Propyl 2-Phenyl-Phenyl Sulphate—16 Gm pyridine were dissolved in 100 cc carbon bisulphide and the solution cooled in an ice bath 12 Gm chlorosulphonic acid were added with good stirring during ten minutes There was formed a crystalline precipitate of the double compound of pyridine and chlorosulphonic acid 21 Gm of 4-n propyl 2 phenyl phenol in an equal volume of carbon bisulphide were then added all at once After heating for one hour on the steam bath the carbon bisulphide was distilled off and 10 per cent potassium hydroxide added until strongly alkaline to litmus The solution was then concentrated and allowed to crystallize The crystals were washed with ice cold water and then with alcohol and dried *in vacuo* The yellow crystalline powder was readily soluble in water and slightly soluble in cold alcohol It decomposed without melting at 180–190° C

Preparation of Potassium 6-Chloro 2-Phenyl Phenyl Sulphate—This salt was prepared by the method described for the corresponding propyl compound It formed a yellowish white crystalline powder which decomposed on heating

Both of these sulphuric esters in water gave practically neutral solutions which slowly developed alkalinity upon standing

SALIVA TESTS III DETECTING THE ADMINISTRATION OF SOME OPIUM DERIVATIVES TO HORSES *

BY JAMES C MUNCH ¹

Previous papers in this series (1, 2) report the development of a method for detecting morphine and heroin in the saliva of horses after the subcutaneous or intramuscular injection of known drugs (that is, the investigators knew that the horses had received morphine or heroin at the time tests upon mice were conducted)

TABLE I—THRESHOLDS FOR MOUSE TESTS WITH OPIUM ALKALOIDS

Product	Mg /Kg	10 Med 70% Effective Dose Gamma/20 Gm	Mouse
Morphine	4 00		80
Codeme	3 00		60
Dionine	1 00		20
Dilaudid	0 6		12
Heroin	0 05		1

The normal salivas collected from over one hundred untreated horses have been injected into mice, in no instance has an effect been observed resembling that produced by the opium alkaloids. The solution obtained by dissolving morphine or heroin in such a saliva, or in normal horse serum, produced the same effects

* Scientific Section A PH A, Washington meeting, 1935

¹ Sharp and Dohme, Philadelphia, Penna

upon mice as the same concentration in water. The quantities of these drugs producing definite symptoms in seventy per cent of the injected mice (ten or more mice being used on each dose) are given in Table I. In making critical tests, each mouse should be scrutinized before use, as we have found some normal mice tending to show some (but never all) of the symptoms produced by the opium alkaloids. Unless this precaution is taken, misleading results may be obtained.

Since the "doping" of race horses is not permitted by Racing Commissions, it seemed advisable to conduct a series of experiments simulating race-track conditions. Twenty horses were injected subcutaneously with colorless solutions, the composition of which was unknown to the investigators. Gelatin capsules, whose contents were unknown, were administered by mouth to seventeen horses. The general procedure outlined in the first paper of this series was followed.

The saliva was collected from each horse immediately before injection or administration, and at definite intervals afterward (15, 30, 45, 60, 90 and 120 minutes, and sometimes 3 hours and 24 hours). In some instances $\frac{1}{4}$ grain of arecoline hydrobromide was administered or injected. This facilitated the collection of saliva but did not influence the results of the test.

The mouth of the horse was not drenched or washed, but every effort was made to obtain undiluted saliva. The opening of a 5 cc vial was brought in immediate contact with the gingival margins, cheeks and tongue, and the thick slime obtained directly. When the contents were not sufficiently fluid, 1 cc of distilled water was added to each vial and thoroughly shaken with the slime. A volume of 0.5 to 1 cc was then injected into one or more mice weighing about 20 Gm.

TABLE II—SPECIFICITY OF MOUSE TESTS FOR DETECTION OF 'DOPED' HORSES
DRUG SOLUTIONS INJECTED SUBCUTANEOUSLY

Horse No	Weight Kg	Veterinary Deductions	Deductions from Mouse Tests		Product Injected	Treatment of Horse Dose Injected Gamma/Kg	
			Horse Treated	Size Dose		Mg /Horse	Kg
339	560	Excitable	No		Water		
372	455	Normal	No		Water		
341	455	Normal	Yes	Small	Morphine	100	220
340	520	Excited	Yes	Large	Morphine	200	380
380	465	Normal	Yes	Small	Heroin	2	4
379	450	Excited	Yes	Large [?]	Heroin	4	9
371	445	Normal	Yes	Large [?]	Heroin	6	13
342	435	Normal	Yes	Small [?]	Heroin	6.5	15
343	430	Excited	Yes	Large	Heroin	6.5	15
347	420	Refractory	Yes	Large	Heroin	15	36
346	475	Very excited	Yes	Large	Heroin	50	105
377	480	Normal	Yes	Small	Codene	25	50
378	495	Normal	Yes	Large [?]	Codene	100	200
374	410	Normal	Yes	Large	Codene	200	490
375	445	Normal	Yes	Small	Dilaudid	2	5
370	455	Stimulated	Yes	Large [?]	Dilaudid	4	9
382	465	Stimulated	Yes	Large	Dilaudid	6	13
349	445	Stimulated	Yes	Large	Dilaudid	10	22
352	510	Stimulated	Yes	Large	Dilaudid	40	79
345	455	Stimulated	Yes	Large	Dilaudid	100	220

The effects upon the mice were noted over a period of half an hour although positive reactions usually developed within ten to twenty minutes. In some instances injected mice died over night, but no relation could be established between death and the drug administered. In some tests in which the saliva was obtained by swabbing the horse's mouth, and diluting to approximately

300 cc with water, unsatisfactory results were obtained, the amounts of the active substances in the saliva had been too greatly diluted. Such samples must be concentrated by suitable chemical methods before testing.

The solutions and the capsules were prepared by a member of the laboratory (A Q) and given code numbers. This worker retained the code and took no part in the administration or mouse testing. Based upon our observations upon mice, an attempt was made to answer two questions: (1) Do the mouse tests on the salivas from a horse suggest that the animal has been "doped?" (2) If "doped," was a large or a small amount of drug administered?

After we recorded our opinions as to "doping" and dose, contact was reestablished with A Q and the code consulted for the first time. The detailed data of these tests are given in Tables II and III.

TABLE III—SPECIFICITY OF MOUSE TESTS FOR DETECTION OF 'DOPED' HORSES
DRUG ADMINISTERED IN GELATINE CAPSULES

9988	405	Quiet	Yes	Large	Opium gum	1000	2475

The results obtained in making tests on the saliva of twenty horses which were injected with unknown solutions are given in Table II. It will be observed that the opinions of the veterinarians were not always in agreement with the subsequent information in indicating whether a horse had or had not been "doped." The mouse tests were correct in every instance, in showing whether a horse had or had not been "doped," and also in suggesting whether a large or a small dose had been administered. In the case of heroin and Dilaudid, the smallest doses injected were 2 mg per horse. These doses correspond to the single doses of these drugs administered to humans. It will be noted that the veterinarians were unable to observe any evidence of abnormality in these horses.

Through the courtesy of Jervis Spencer of the Maryland Racing Commission, and of Doctors W B D Penniman and T A Ladson, we obtained samples of saliva collected from a Maryland race horse, using the customary race-track pro-

cedure the horse's mouth was washed with water, the gauze and gloves being added to the washings and the entire collection made up to about 300 cc with distilled water. Samples of saliva were obtained 30 and 45 minutes after administering 10 grains of morphine sulphate in a gelatine capsule. The horse was galloped for about two miles, and saliva samples collected approximately one hour and one and one-half hours after administration. The injection of 1 cc of each sample as collected produced a positive reaction when tested on May 14th, or the day after the saliva had been collected. These saliva samples were stored in a refrigerator and retested with the same positive results after one week, and after two months. Since the horse was known to have received morphine sulphate, the results are not included in Table III. The veterinarian was unable to observe any abnormalities in this horse, nor could the jockey detect any differences in his behavior.

Based upon this test, the experiments recorded in Table III were undertaken. Veterinary observations were not always indices of the treatment accorded the horses. The mouse test was again correct in each instance in answering the question whether a horse had or had not been "doped." Morphine appeared to be somewhat more potent than the corresponding dose of opium. Pantopon was moderately effective.

Our studies are being continued in an attempt to detect characteristic symptoms for each of these products, and some success has already been attained. We do not feel justified at this time in asserting, based *solely* upon these mouse tests, which of these opium derivatives was given to a horse. However, we do feel that a positive mouse test would justify the time, labor and expense of a chemical search. Chemical tests of the saliva may be able to identify these products.

CONCLUSION

1. Mouse tests upon the undiluted salivas collected from 37 horses correctly showed, in every instance, whether the horse had or had not received an opium derivative (opium, morphine, heroin, codeine, Dilaudid or Pantopon).

2. Present information does not permit identification of the specific product administered in all cases. Characteristic symptoms for such identification are being sought.

FOOT-NOTE Through the courtesy of Commissioner of Narcotics H. J. Anslinger, supplies of morphine, heroin, Pantopon and opium were made available for this investigation. Dilaudid was purchased on the open market. The technical assistance of Arnold Quici in the preparation of these solutions and capsules and Dr. J. C. Horner, Dr. W. A. Paxson, Robert Moore, Harry J. Pratt and Aaron B. Sloane in the administration of these drugs, the collection of saliva and the conduct of the mouse tests is gratefully acknowledged.

THE ASSAY OF NATIONAL FORMULARY PREPARATIONS
CONTAINING BISMUTH *BY GLENN L. JENKINS AND SYLVIA MILLETT ¹

Glycerite of Bismuth is the only bismuth preparation in the National Formulary for which a tolerance and assay are now official. The present study was undertaken to determine whether the method of assay employed for the glycerite could be applied to the determination of the bismuth content of Solution of Bismuth, Elixir of Bismuth, Elixir of Pepsin and Bismuth and Elixir of Pepsin, Bismuth and Strychnine, and also to determine whether other methods might be applied advantageously to the assay of these preparations.

Various methods have been utilized for the quantitative determination of bismuth, namely the official sulphide method (1) which is known to be accurate, the formaldehyde method (2) which is not suitable since the procedure does not separate other metals commonly present as impurity, the electrolytic method (3) which is not further considered since electrolytic methods in general have been deleted from the eleventh revision of the United States Pharmacopoeia, and methods based on the precipitation of bismuth as the phosphate. Moser (4) reported that the phosphate process is the most advantageous method of estimating bismuth since bismuth phosphate, BiPO_4 , is of definite composition, it forms a white, heavy crystalline precipitate which is insoluble in water and very dilute nitric acid, it deposits and filters quickly, it is not changed by ignition, and it is not readily reduced. This method was further studied by Stahler and Scharfenberg (5), Salkowski (6), Stahler (7) and Schoeller and Waterhouse (8). Schoeller and Waterhouse critically reviewed much of the earlier investigator's findings. Working with pure bismuth nitrate solutions, they concluded that the quantitative precipitation of the phosphate was a matter of rather delicate adjustment, if the acidity was low, the liquid on being heated usually deposited a heavy crystalline precipitate of oxynitrate, and if the acidity was higher than necessary to prevent deposition of oxynitrate, a small fraction of the bismuth failed to precipitate as phosphate unless an excessive quantity of alkaline phosphate was added. Mayer (9) recommended a phosphate method for the assay of bismuth without giving experimental data to indicate the accuracy of the procedure.

In the present investigation, a comparative experimental study of the official sulphide method, of the Mayer phosphate method and of the Schoeller and Waterhouse phosphate method was undertaken. The procedures followed were (1) That of the National Formulary V for Glycerite of Bismuth in the sulphide method (2) The Mayer phosphate method which is as follows

Accurately measure 5 cc. of Glycerite of Bismuth into a 400 cc. beaker, add about 100 cc. of water, heat to boiling, then add concentrated hydrochloric acid until the precipitate which at first forms redissolves and then add ammonia water until a turbidity is produced after which sufficient concentrated hydrochloric acid is added to clear up the turbidity, to this boiling solution

* Abstracted in part from a thesis submitted by Sylvia Millett to the Graduate School of the University of Maryland in partial fulfillment of the requirements for the Degree of Master of Science.

add an excess (about 50 cc should be sufficient) of ten per cent ammonium phosphate solution drop by drop from a 50 cc pipette. Allow to settle and filter the precipitate on a Gooch crucible and wash with hot water until free from chlorides and after drying crucible and contents, place in a nickel crucible and heat until the weight is constant.

"Multiply the weight of the precipitate by 0.7663 and then by 20, the result will be the grams of Bi_2O_3 in 100 cc of sample."

(3) The Schoeller and Waterhouse phosphate method modified to adapt it to use with the official bismuth preparations as follows

Accurately measure a portion of the preparation representing about 0.5 Gm of Bi , dilute the solution to about 100 cc with distilled water, and carefully add ammonia water until a slight permanent precipitate is formed. The precipitate formed in cold solution is not the crystalline oxynitrate but a flocculent basic nitrate which dissolves on the addition of nitric acid. Add 2 cc of nitric acid, heat the solution to boiling and precipitate the bismuth while the solution is boiling by adding a 10 per cent solution of diammonium phosphate. The addition of ammonium phosphate should be made very slowly at first (preferably from a burette at the rate of about 30 drops per minute) and with constant stirring to favor the formation of a coarsely grained precipitate. When no more precipitate forms, the remainder of the precipitant may be added rapidly. A considerable excess of the ammonium phosphate solution should be used, about 60 cc of 10 per cent solution for each 0.5 Gm of bismuth was found to be best. After adding the precipitant, dilute the solution to 400 cc, digest the solution on a water bath for 20 to 30 minutes, and decant the supernatant liquid through a Gooch crucible. Wash the precipitate twice with a hot 3 per cent solution of ammonium nitrate containing 0.5 cc of nitric acid per liter, wash the precipitate into the crucible, dry and ignite gently. Each Gm of BiPO_4 is equivalent to 0.6865 Gm of Bi .

This procedure entirely obviates the formation of crystalline oxynitrate caused by deficiency of nitric acid, while the subsequent dilution of the liquid reduces the concentration of the nitric acid so that all of the bismuth is precipitated as phosphate.

ASSAY OF GLYCERITE OF BISMUTH

Two samples of Glycerite of Bismuth prepared by the method of the National Formulary V were assayed by the three methods. Five-cc samples of the glycerite were accurately measured from a pipette calibrated to contain 5 cc and the glycerite adhering to the wall of the pipette was washed out with distilled water. The results given in the following table are expressed in terms of per cent Bi W/V.

TABLE I—ASSAY OF GLYCERITE OF BISMUTH

Method	Analyst A		Analyst B	
	Sample 1	Sample 2	Sample 1	Sample 2
Sulphide	14 33, 14 77	12 35, 12 48	14 36, 14 40	12 45, 12 52
Mayer phosphate	14 29, 14 32	12 43, 14 47	14 38, 14 35	12 50, 12 46
Schoeller Waterhouse phosphate	14 69, 14 68	12 90, 12 60	14 60, 14 42	12 78, 12 82

The results show that the sulphide and the Mayer phosphate methods yield equally accurate and comparable results and that the Schoeller Waterhouse phosphate method yields slightly high results. Consequently, the Schoeller Waterhouse phosphate method was eliminated and further study was limited to the sulphide and Mayer phosphate methods. Samples of solution of bismuth, elixir of bismuth, elixir of pepsin and bismuth and of elixir of pepsin, bismuth and strychnine were prepared from the respective glycerites and assayed with results as follows

Calculated	1 80	1 60	1 80	1 60

SUMMARY AND CONCLUSIONS

1 A comparative study has been made of the accuracy of the sulphide, Mayer phosphate and Schoeller Waterhouse phosphate methods of estimating bismuth in bismuth containing liquid preparations of the National Formulary

2 The Schoeller Waterhouse phosphate method does not yield accurate results when applied to these preparations

3 Either the sulphide method or the Mayer phosphate method yields accurate and comparable results when applied to the glycerite, solution or elixirs of bismuth

4 Since the Mayer phosphate method is simple and accurate, it might advantageously replace the sulphide method now official for the assay of glycerite of bismuth and be made official for the assay of the solution and elixirs containing bismuth

POTASSIUM GUAIACOL SULPHONATE *

BY A. H. CLARK AND ERNST KIRCH

For several years potassium guaiacol sulphonate has been used as a medicament in the treatment of those conditions in which guaiacol is indicated. Since it is a very stable compound, as all aromatic sulphonates are, its use may be looked upon as irrational but it is popularly believed to be absorbed as an entire molecule and in this way acts as does guaiacol. Be this as it may it is very widely used, especially as a syrup, and its manufacture and sale is a commercial enterprise of considerable importance.

There are several guaiacol sulphonic acids and their salts possible from a theoretical standpoint and some of these have been described. Guaiacol, the basic substance, has the following structure

If the carbon atoms of the ring are numbered as above it is seen that four guaiacol sulphonic acids are possible, namely the 1,2,3, the 1,2,4, the 1,2,5 and the 1,2,6. From each one of these acids, as well as by replacement of the hydrogen in the OH group, or in both ways at once, salts may be formed. Several guaiacol sulphonates are thus possible. The only ones of importance in which we are interested at the present time are those in which the metal enters the sulphonic acid group since the presence of the potassium in the OH group is incidental only.

Much confusion in the nomenclature of these salts is occasioned by different writers using such terms as ortho, meta, para, viscinal, alpha, etc., to indicate the position of the three substituents in the benzene ring. It is not always clear whether the OH or the OCH₃ group is the basic one used and it is evident that two viscinal compounds are possible. To avoid all confusion in the following discussion the system of numbering as given above will be used throughout and even the terms used by others will be translated into this system when it is possible to do so.

The questions that prompted this investigation are: Is there any difference in therapeutic activity between the four possible salts? If so, which one is the most active? If any one is more active than the others how may it be distinguished from the others? What is the product commonly sold? When it is considered that many pharmaceutical houses market potassium guaiacol sulphonate without any statement as to what it is, the importance of a correct answer to these questions is obvious.

Search of the available literature reveals no records of painstaking pharmacological work on this substance. From its very nature it might be assumed to liberate guaiacol with difficulty and therefore have no value unless it is absorbed as

* University of Illinois, College of Pharmacy Chicago, Ill.

an entire molecule Frankel (1) states that the 1,2,4 compound has no value while the 1,2,6 has May (2) states that the 1,2,3 compound is therapeutically useful and that the 1,2,4 has no value Barrowcliff and Carr (3) state that it is important the salt should be free from the 1,2,4 compound Fourneau (4) states that Thiocol is the 1,2,6 compound Rosenthaler (5) states that Thiocol is 1,2,6 and that the 1,2,4 is not to be employed Evers (6) states that potassium guaiacol sulphonate is the salt of the 1,2,5 acid

In this connection some value may be attached to the fact that the following authorities recognize the 1,2,6 compound, specifically mentioning it in their descriptions which would indicate preference over the others New and Nonofficial Remedies of the A M A, all editions from 1918 to 1934, inclusive, Svenska Farmakopen, 1925, Pharmacopœa Hungarica, IV, 1934, British Pharmaceutical Codex, 1934, Deutsches Arzneibuch, Prior to 1926, Merck's Index, IV, 1930

Other authorities described it as follows Pharmacopœa Helvetica, V, 1933, as a mixture of 1,2,4 and 1,2,5, Deutsches Arzneibuch 1926 as a mixture of 1,2,4 and 1,2,5, Pharmacopœa Jugoslavica 1933 as 1,2,5

The first to give attention to guaiacol sulphonic acid or potassium guaiacol sulphonate seems to have been Tiemann and Koppe (7) but Barell (8) was the first to make any study of its structure He thought that he had made the 1,2,6 acid This conclusion seems to be incorrect in the light of later and very thorough work which is ably presented by Paul (9) The latter showed that by sulphonating guaiacol below 100° C a mixture of the 1,2,4 and 1,2,5 acids is formed Rising (10) studied the subject about the same time and published the results of his work a little later He concludes that the 1,2,4 and the 1,2,5 acids are readily prepared at temperatures below 100° C, most readily at 70° C If the temperature is 135–140° C he claimed to have prepared a so-called viscinal acid, either the 1,2,3 or the 1,2,6 These various acids were studied, their potassium salts described and other facts recorded He concluded that the marketed products at that time were mixtures of the 1,2,4, the 1,2,5 and some of the basic salt, that is potassium replacing the hydrogen in the OH group

Paul (11) published a second paper in which he disagreed with some of Rising's conclusions, holding that the latter's viscinal compound, the 1,2,3 or 1,2,6 was in reality $C_6H_3(OH)(OH)HSO_3$ 1,2,4 and offers evidence to support this stand It is significant that Rising did not publish any comment on this criticism At this point the matter rested for about twenty years until Rupp and Brixen (12) published the results of much work done on these products and also pharmaceutical preparations made from them

From these sources the answers to the last two questions asked in the beginning of this discussion are obtained With the exception of Barell's work the conclusion is that the products marketed up to 1926 were mixtures of the 1,2,4 and the 1,2,5 compounds with small varying amounts of the basic one No investigator has shown that any marketed product consisted, even in a small degree of the 1,2,6 compound and it seems certain that it never has been made We have examined samples of potassium guaiacol sulphonate from seven different sources in addition to Thiocol and every one of them is substantially the same in every way and when examined by the methods used by the authors referred to above are found to be a mixture of the 1,2,4 and 1,2,5 salts

The tests, data, etc., upon which this conclusion is based are summarized in the following statements

Physically all samples were about the same. Colorless crystalline powders, odorless, of a faintly bitter taste, and a neutral or slightly alkaline reaction to litmus. Marked alkalinity indicates basic character, i.e., some of the H in the OH group replaced.

The melting points of the free acids obtained from samples prepared directly from guaiacol were 96–97° C for the 1,2,4 and 106.5–107.5° C for the 1,2,5. The same acids prepared from Thiocol gave 96.5–97.3° C and 106.5–107.5° C and from one commercial sample, acids isolated gave 96.5–97.5° C and 106–107.5° C. The figures given by Rising (10) are 97–98° C and 106–108° C. Since all other samples were alike in other respects no further melting point determinations were made.

Every sample gave dinitroguaiacol the melting point of which varied between 121.5° and 122° C, indicating according to Rupp and Briven (12) the presence of the 1,2,4 compound. The figure given by Mulliken (13) for this compound is 122° C. The following four reactions are the same as used by Rupp and Briven.

Ferric chloride gave a blue coloration with every one of our samples.

Lead acetate precipitates the 1,2,4 acid but not the 1,2,5 and all samples behaved alike with this reagent.

Lead subacetate precipitates both the 1,2,4 and the 1,2,5 acids and with those samples on which this test was tried precipitates were obtained.

Ammonia water and calcium chloride precipitate with the 1,2,4 acid but not with the 1,2,5. This was the case with those samples on which the test was used.

Upon coupling with diazobenzene as directed by Rising both the 1,2,4 and the 1,2,5 compounds give an orange-red coloration but no precipitate. This coloration was given by all our samples.

The solubility in water is of some interest since the 1,2,5 salt is much more soluble than the 1,2,4. All our samples were freely soluble and all about alike. From a careful observation all samples examined contained about 75% of the 1,2,4 and 25% 1,2,5.

Rising claimed that his viscinal compound, the 1,2,6 or 1,2,3 as he stated it to be, gave a green color with ferric chloride, a purple color with lead acetate, a precipitate only after standing with lead subacetate and brown flakes with diazobenzene. Since no sample examined by us gave any of these reactions, not one of them contained what Rising thought to be the 1,2,6 compound.

CONCLUSIONS

This study has brought out the following facts about potassium guaiacol sulphate

- 1 That the evidence supporting the belief that the 1,2,6 compound is the most valuable from a therapeutic standpoint or that the 1,2,4 is valueless or harmful, is very slight and practically worthless

- 2 That the 1,2,6 compound never has been made

- 3 That all market products are alike, eight of them having been examined by us

- 4 That since the 1,2,6 compound does not exist and the market products are all alike no tests can at present be suggested to distinguish one product from another

unless some manufacturer begins to separate the 1,2,4 from the 1,2,5 and markets a single salt in place of the mixture or some one actually makes the 1,2,6 compound

5 That the proportion of the 1,2,4 to the 1,2,5 is approximately 3 to 1

A COMPARATIVE STUDY OF ENTERIC COATINGS ¹

BY F S BUKEY AND PHYLLIS RHODES ^{2 3}

The authors in a previous study of enteric coatings found a wide variation in the efficiency of the coating materials. It was, therefore, decided to test various types of commercial coatings. Several of the pharmaceutical manufacturers agreed to cooperate in this study by applying their enteric coatings on tablets of barium sulphate.

Five different enteric coatings were submitted by the manufacturers for this study. Among these types were two of keratin, one salol-shellac, one shellac and one composed of a mixture of salol and resins. In every case the products submitted were finished and in external appearance resembled any sugar-coated tablet. The uncoated tablets measured 10.5 mm in diameter and 4.8 mm in thickness. In addition to the tablets, one manufacturer supplied enteric and sugar-coated No. 1 capsules filled with barium sulphate.

The subjects for these experiments were picked from the student body and in every case normal individuals in apparent good health. The X-ray was used to determine the exact point of disintegration. In general, the following procedure was used in making this study. Each subject was given a certain number of tablets followed at once with a glass of water containing a teaspoonful of Bari-o-meal. The Bari-o-meal was sufficient to outline the stomach, but did not produce a density great enough to mask the tablets. The first radiograph was usually taken after 30 minutes and others followed at desired intervals until disintegration occurred.

It is evident from the data obtained that there is about as much variation in the commercial coatings, as in those prepared in the laboratory. On considering the keratin coating No 1, we find total disintegration in the stomach, the average time being about one hour. These tablets are of no value for enteric medication. From experience we have had with keratin as an enteric coating we concluded that the adverse results were caused by a faulty method of application. The results of the experiments for keratin No 2, showed that 13 tablets disintegrated in the colon, 4 in the small intestine, and 1 in the stomach. The point of disintegration of 7 was unknown, and 3 were excreted. This coating proved to be 80.95% efficient. In making this calculation for the various coatings, results were disregarded in all cases where the exact point of disintegration was unknown. The results from the keratin No 2 coating indicate an exceptionally good enteric coating. The experiments for the shellac coating show that these tablets are of no value for enteric medication. The average time for disintegration was between 70 and 100 minutes. Faulty application cannot be claimed for this coating as other tablets purchased on the market disintegrated in about the same average time. In the case of the salol resin mixture, 13 tablets disintegrated in the stomach and 22 tablets in the intestine. Five tablets had not disintegrated when the last picture was taken, and their fate was not determined. This enteric coating was 63.00% efficient. The results of the experiments using salol shellac showed that 8 tablets disintegrated in the small intestine and 4 in the stomach. Four capsules disintegrated in the small intestine and 5 in the stomach. The fate of 3 capsules was not determined. The average time of disintegration for the tablets was 6 hours and of the capsules was 4 hours. The percentage efficiency of the tablets was 66.66% and of the capsules was 44.44%. In this case, it appears that the tablets are a better means of medication than the capsules.

It may be concluded that none of the enteric coatings studied was perfect. The best results would seem to be obtained with keratin when properly applied. However, if one considered the absorption rate of the colon less than that of the small intestine, the salol mixtures would be better. Capsules with the same type of enteric coating as a tablet are not as efficient, due no doubt to mechanical difficulties as the capsules roll thru on the ends during the coating process. Shellac by itself is of no value as an enteric coating.

The authors wish to thank the Abbott Laboratories Inc. North Chicago Ill. G. D. Searle Co., Chicago, Ill., Sharp and Dohme Co., Baltimore, Md. and the Smith Dorsey Co., Lincoln Nebr., for their cooperation in coating tablets for this study. The authors also wish to thank the students of the College of Pharmacy, University of Nebraska, for their assistance as subjects in this study.

ENTERIC COATINGS. I. A LABORATORY METHOD FOR THE STUDY AND CONTROL OF ENTERIC COATINGS *

BY MILTON WRUBLE

Several years ago a preliminary report on enteric coatings was made by the writer (1). Since that time the opportunity has presented itself to study the prob-

lem more intensively and in a more comprehensive manner because of the availability of apparatus and working facilities

p_H of Gastric and Intestinal Juices—The normal acidity of the gastric juice due to the free hydrochloric acid present ranges from about *p_H* 1.6 to *p_H* 1.8. However, it usually varies over a much wider range

Vanzant, Alvarez, Eusterman, Dunn and Berkson (2) have studied the gastric acidity of 3746 persons in whom careful examination did not reveal any disease which could perceptibly affect the mucous membrane or the secretory activity of the stomach

They found a steady increase in the incidence of achlorhydria from youth to old age and that free gastric acidity appears to increase rapidly from childhood to the age of 20 years when adult values are reached. They also found that about the age of puberty, the average value for boys begins to rise considerably above that for girls

Boldyreff (3), who has made extensive investigations in this field, has proved that in the normal organism during digestion as well as in the empty stomach the acidity of the gastric contents is mainly regulated by the alkali of the pancreatic juice regurgitated from the duodenum into the stomach

He has further shown (4) that the entrance of duodenal secretions into the stomach occurs as a purely physiological phenomenon (a) when the stomach and duodenum are empty (b) with abundance of acid in these organs, (c) with abundance of fat in these organs and with any strong irritation of the duodenal mucosa caused by hot or cold liquids, alcohol, etc.

Much evidence has been presented within recent years to show that in the human small intestine the reactions may vary from distinctly acid to slightly alkaline. Long and Fenger (5) have made an important contribution in this direction

Howell makes the following statement (6): "The secretions emptying into the small intestine—the succus entericus, the bile and the pancreatic juice, all have a slightly alkaline reaction and we should expect, therefore, to find the reaction of the intestinal contents on the alkaline side." Most observers have reported, however, that during digestion the reaction of the contents is acid."

Recent work with dogs by Bollman and Mann at the Mayo Clinic (7) has shown that during digestion the reaction in the duodenum may vary between *p_H* 3.8 and *p_H* 6.6. In the jejunum they found the reaction to be on the acid side. In the ileum they observed that even during digestion the reaction did not drop below the neutral point *p_H* 7.0.

Temperature—Hepburn, Eberhard, Ricketts and Rieger (8) measured temperatures in the gastrointestinal tract with a recording thermometer. In a group of 257 healthy, active individuals the gastric temperature was between 97.5 and 102.2° F. In a group of 53 subjects the temperature of the upper part of the intestine lay between 98° and 100.1° F.

The ingestion of either ice water or ice cream produced marked decrease in gastric temperature, followed by a rise, at first quite rapid, then progressively slower. The average recovery time exceeded one-half hour. The use of ice water in a test-meal was found to delay the gastric emptying time by from 15 to 30 minutes.

The authors obtained evidence that leakage of a cold beverage through the pylorus lowers the temperature of the upper part of the intestine by several degrees. This observation may throw light on the etiology of the gastroenteric disturbances in patients who have a rapid emptying time and partake copiously of cold beverages.

The ingestion of hot coffee produced a marked increase in gastric temperatures followed by a decrease, at first rapid then progressively slower.

Motility or Emptying Rate of Stomach—The peristaltic activity of the healthy stomach begins shortly after the ingestion of the meal, but its advent may be retarded or even inhibited by nervous states and emotions

The motility of the stomach depends on several factors. The average emptying rate in patients without obstructive lesions lies between three and five hours. Briggs (9) made such a study with 100 normal individuals employing the barium meal. He obtained the following figures: The stomach emptied in two and a half hours in 1 per cent, in three hours in 6 per cent, in three and a half hours in 9 per cent, in four hours in 44 per cent, in four and a half hours in 32 per cent and in five hours in 8 per cent.

Campbell and Conybeare (10) independently examined a group of healthy male students by means of the fractional test meals and also radiographically. They demonstrated that hypertonus, hyperacidity and rapid emptying of a barium meal occurred most frequently in men of the broad-chested, vigorous, athletic type, hypotonus, low acidity and slow emptying for the most part in narrow chested men below the average of physical development and not taking regular exercise.

Bukey and Brew (11) in their study of the emptying time of the stomach with reference to pills and tablets, arrived at the following conclusions:

Fig 1

Fig 2

- (1) The size and shape of a pill, tablet or capsule have no effect on the length of time it will remain in the stomach
- (2) The same individual does not react uniformly toward this type of medication with reference to emptying time
- (3) Emptying time may be influenced by diet
- (4) The type of coating does not have any effect on the length of time that pills, tablets and capsules will remain in the stomach

Motility may be impaired or exaggerated by disease. Abnormal rapid emptying or hypermotility occurs in a certain proportion of cases of duodenal ulcer with hypertonus.

EXPERIMENTAL

The actual *in vitro* study of enteric coatings may be conveniently carried out in an apparatus in which the tablets are allowed to rotate in buffers covering the gastric and intestinal ranges at temperatures between 37.5° to 40° C. The apparatus employed (12) was a modification of a type used in earlier investigations in this field. The disintegration point was observed in each case.

While it is true that such a mechanical test can be but a mere approach to the actual picture of conditions in the stomachs and intestines of individuals of widely varying characteristics, still it has been possible to establish a relationship in this manner and thus such a procedure has been of real value in the laboratory study and control of enteric coatings

Hundreds of tablets and capsules have been studied as described, in this laboratory. From the numerous observations made it is significant to note that in every case the coating surface of the tablets immersed in buffers from p_H 1.2 to p_H 6.4 showed little change even after rotating for eight hours or more while those immersed in buffers beginning with p_H 6.4 and upward showed evidence of attack and a definite shriveling effect within 5 to 15 minutes. See Figs 1 and 2

Examination of the latter tablets indicates that the enteric coating has permitted the passage of fluids through it by becoming permeable while in the other case the coating has remained entirely impervious even after many hours of rotation and contact

DISCUSSION

Recent investigations have definitely indicated that our earlier notions regarding the acidity and alkalinity of the stomach and small intestines, respectively, are erroneous. More often the small intestine is slightly acid in reaction and the p_H of the stomach will doubtless vary over a considerable range because of regurgitation and the other factors already enumerated

In addition, therefore, to the requisite physical and chemical properties that a coating must possess and the fact that it must be physiologically inert, it must also resist the wide and variable acid range in the stomach and commence to disintegrate at the slightly acid reaction found in the small intestine. If a coating requires a decidedly alkaline reaction before disintegration commences, the tablet or capsule will in all probability pass through the small intestine without disintegration taking place

CONCLUSIONS

1. A laboratory method for the study and control of enteric coating has been described
2. The extreme sensitivity of this coating in buffers is noted

' In the human small intestine the reaction may vary from distinctly acid to slightly alkaline on the part which may be reached by the Rehfuß tube where the tube is far enough down to secure a uniform mixture of contents. The acid reaction is apparently as common as the alkaline, but the degree of acidity is not sufficient to check the tryptic digestion, which in some instances seems to be favored by a reaction on the acid side of neutrality. The reaction found must vary with the state of diges-

tive acidity and is simply an equilibrium condition between the chyme and the alkaline juices poured into the duodenum Any reaction near neutrality may obtain "

AN UNUSUAL MORTAR AND PESTLE *

BY JOHN E KRAMER ¹

In one of the museum cases of the Philadelphia College of Pharmacy and Science there is an unusual mortar and pestle attracting the attention of even the most casual passer-by The mortar is made of bronze, 6½ inches high, 5 inches in diameter at the bottom and 6 inches across the top Two handles, one projecting from either side, about half way up from the bottom, are the first things to catch the eye Further inspection reveals a band across the mortar bearing the inscription "NAPOLEON-EMPEREUR " Immediately the investigating spirit is aroused, and close scrutiny reveals a smaller band running around the top with the words "A Besancon Biellemand-Pharmacien-Drogiste" cast in the band Between these bands can be seen wreaths and eagles, alternating, and in the space between the lower band and the bottom of the piece, emblems of two figures facing each other and more wreaths alternate

A Monarch's Mortar

The pestle is also of bronze and is 9½ inches long Through the center it is 1½ inches in diameter but at the ends the diameter reaches 3¾ inches There appear two imperial shields and eagles and the inscription "Anno 1802 " These pieces were presented to the College by Dr David Costelo of New York

It was just one year after the date on this pestle that the Pharmaceutical Society was founded in Paris And it was in 1804 that Napoleon, at the beginning of his greatest bid for fame, secured a popular vote changing France to an empire, and secured for himself the title of Emperor of France Evidently, with the acquisition of this new title, Napoleon had all his belongings stamped accordingly, hence the band around the middle of the mortar

The royal courts of those days had, by appointment, doctors, druggists and others to satisfy the various needs of the emperors and their retinues Biellemand was the favored pharmacist at this time and used this mortar in which to mix the potions and pill masses for the great Corsican and his court The position was no

sinecure, for, where the master went a-warring, his appointed servitors followed in his wake, the physician and the pharmacist no doubt being among the most valuable in the party

The years 1802 to 1805 were peaceful years for Napoleon. The Treaty of Amiens, in 1802, had put France at peace with the world for the first time in ten years. But Napoleon's interference with the affairs of other countries brought an early end to this tranquility in international relationships and to the comparative ease of Bieillemand's appointment.

War broke out again in 1805, resulting in the defeat of the Austrians and the Russians by Napoleon at Austerlitz on December 2nd. On October 14, 1806, he defeated the Prussians at Jena and on June 14, 1807, he defeated the Russians at Friedland.

This was an eventful period in the life of France and Napoleon, and, co-incidentally, in the life of Bieillemand. Many were the campaigns of the Emperor and long and hard were the voyages. Sometime in the midst of these campaigns, about 1808, records show that Napoleon appointed Charles Louis Cadet de Gassicourt his personal pharmacist, and we have, then, but six years in which to give this mortar and pestle credit for active life in His Majesty's service. Just how many places they went, and how many medicines they helped mix can be told only by the pieces themselves. Silently they stand now, ever to be a source of wonder and much conjecture.

THE SIR HENRY S. WELLCOME MEDAL AND PRIZE

COMPETITION FOR 1935

The competition is open to all medical department officers, former such officers, Acting Assistant and Contract Surgeons of the Army, Navy, Public Health Service, Organized Militia, U. S. Veterans' Administration, U. S. Volunteers and the Reserves of the United States, commissioned medical officers of foreign military services, and all members of the Association, except that no person shall be awarded a prize more than once in the prize competitions of the Association. All competitors who are not already members of the Association are eligible to membership, and the Executive Council of the Association hopes that they will exercise their privilege and join.

The Executive Council has decided that the Wellcome Prize for 1935 be awarded for the research work most valuable for the military service performed in any branch of medicine, surgery or sanitation, report of which is submitted in competition for the prize and has not previously been submitted for publication.

A Gold Medal (including cash prize of \$500.00) will be awarded for the report of research work submitted in accordance with the above conditions which is decided by the Board of Award to be the most meritorious.

Each competitor must furnish five copies of his competitive report. The reports must not be signed with the true name of the writer, but are to be identified by a *nom de plume* or distinctive device. The reports must be forwarded to the Secretary of the Association of Military Surgeons of the United States, Army Medical Museum, Washington, D. C., so as to arrive at a date not later than August 15, 1935, and be accompanied by a sealed envelope marked on the outside with the fictitious name or device assumed by the writer and enclosing his true name, title and address. The length of the report should not exceed a maximum of 10,000 words, it being understood that tabular statements are not counted. The winning report becomes the property of the Association and will be published in the *Military Surgeon*. Should the Executive Council see fit to designate any paper for "first honorable mention" the writer will be awarded life membership in the Association of Military Surgeons, and his report will also become the property of the Association.—*The Military Surgeon*.

THE MICROSCOPY OF POWDERED DESICCATED ENDOCRINE GLANDS *

(ABSTRACT)

BY HEBER W YOUNGKEN

Studies have been made by the author upon the microscopy of certain powdered desiccated glands of internal secretion obtained from cattle and hogs and, in the case of the thyroid and pituitary, also from sheep with a view toward providing microscopical standards for these biological products which are being more and more employed in modern organotherapy

Without microscopical descriptions of these products they would be prone to adulteration with undesirable materials by unscrupulous persons

Descriptive microscopical standards are presented for powdered desiccated thyroid suprarenal, whole pituitary, anterior pituitary, posterior pituitary, ovary, ovarian residue and corpus luteum

Various stains and reagents have been employed in the identification of the different histological elements occurring in each and the reactions of these elements to them are discussed

Powdered desiccated thyroid may be identified by its smooth to striated, hyaline fragments of colloid, some of which contain granules, minute vacuoles, crystalloidal bodies and cells together with the numerous, irregular fragments of follicular epithelium, both of which stain brown with a mixture of Mallory's stain and 1% solution of phosphotungstic acid

Powdered desiccated suprarenal may be identified by its numerous, characteristically stellate to irregularly shaped chromophilic (chromaffin) cells which take a brown coloration with chromic acid test solution together with its characteristic cortical cells as examined in Delafield's hematoxylin and alcoholic eosin

Powdered desiccated whole pituitary may be identified by the numerous large, polyhedral or chromophile cells which show a coarse granulation and which show a distinct affinity for acid stains, acid fuchsin coloring them a deep red the presence of many chromophobe cells of more or less cubical, rounded or pyriform shape with few or no fine granules whose nuclei are colored blue and cytoplasm a paler blue with either Delafield's hematoxylin or a mixture of eosin and methylene blue solution, the mossy neuroglia cells with their many, slender branching processes clearly visible in a mixture of 1% phosphotungstic acid and Delafield's hematoxylin and by the presence of bipolar nerve cells

Powdered desiccated anterior pituitary can be identified by the presence of characteristic chromophile and chromophobe cells and the absence of mossy neuroglia and bipolar nerve cells

Powdered desiccated posterior pituitary may be identified by the very numerous mossy neuroglia cells and bipolar and multipolar cells and the absence of chromophilic and chromophobe cells

Powdered desiccated whole ovary or "ovarian substance" is characterized by the presence of more or less distorted cubical to low columnar epithelial cells whose nuclei take a deep blue and cytoplasm a pale purple or pink color with Delafield's hematoxylin, by the rounded to irregular masses consisting of primary oocytes surrounded by connective tissue elements, the rounded to oval interstitial cells containing granules and fat droplets staining bright red with red acid dyes the numerous fibroblasts with forked ends, the numerous lutein cells often in masses, which appear yellowish in water mounts together with an abundance of dense connective tissue consisting mostly of narrow collagen fibres which swell and are colored yellow in a mixture of 1% picric acid and 1% acetic acid solution

Powdered desiccated ovarian residue shows a similar microscopic picture to powdered desiccated whole ovary except for the almost complete absence of corpus luteum material

Powdered desiccated *corpus luteum* is characterized by its numerous lutein cells, isolated or in masses, the individual cells somewhat polyhedral with spheroidal central nucleus and numerous lutein granules and fat droplets, the groups of lutein cells intermingled with fine collagen fibres and appearing yellowish or greenish yellow in water mounts

97 *Use of the Text of the N F VI* A vote is called for on Motion No 33 (Council Letter No 17 page 512) Voting card enclosed

98 *Tentative General Program for the Eighty Third Meeting* At the request of its president the scheduled dinner of the Kappa Epsilon Sorority on Thursday, August 8th be taken from the program since this organization has no chapter on the coast

The following letter has been received from Secretary Dargavel of the N A R D

'Thank you very much for the invitation extended to attend the Joint Meeting of the Council of the A PH A and the Executive Committee of the N A R D Please be advised that we shall be very glad to accept this invitation and meet with you during your convention There will be at least three members of the Executive Committee at your meeting '

As no further comment on the tentative program has been received a vote on Motion No 34 (Council Letter No 17, page 513) is called A voting card is enclosed and the members of the Council are requested to indicate thereon whether they prefer the meeting of the Council on Saturday, August 3rd or on Sunday, August 4th

June 22, 1935

LETTER NO 19

To the Members of the Council

99 *Printing and Binding Recipe Book, II* At the time the contract for the printing and binding of the N F VI was awarded to the Mack Printing Company (see Council Letter No 10, 1932-1933, A PH A JOURNAL August 1933 page 791) for which their bid was the lowest submitted, the revision of the Recipe Book, Second Edition, had not progressed sufficiently to justify the consideration of a contract for its manufacture When it was recently decided to request bids for the printing and binding of R B II, the Mack Printing Company offered to accept the contract on the same price basis as that for the N F VI, with necessary increases for the higher cost of paper higher cost of binding and electrotypes, and higher cost of printing due to the shorter run The contract limits the edition to 10,000 copies of which only 5000 are to be bound The sales of R B I have totaled about 5500 copies

The following communication has been received from Chairman DuMez of the Committee on Publications

' I am returning herewith the bid from the Mack Printing Company for the manufacture and sale of the Recipe Book II

The price basis for this bid is the same as that which the Mack Company used for the Pharmacopoeia and National Formulary, except that the printing will have to be done in shorter units, which will increase the price somewhat, and there will be a slight increase in cost for paper and the cost for binding and electrotypes

"These are legitimate increases and it is therefore recommended that the contract be let to the Mack Printing Company"

(Motion No 35) *It is moved by DuMez that the contract for printing and binding the Pharmaceutical Recipe Book be awarded to the Mack Printing Company Easton, Penna, on the basis of their proposal of May 10, 1935* A vote on this motion will be called for in about ten days

100 Exemption from Taxation On April 5, 1935, H A B Dunning and E F Kelly attended a hearing before the Commissioners of the District of Columbia, on the petition of the ASSOCIATION for tax exemption on its property, and furnished the information requested about the ASSOCIATION and its activities S L Hilton could not attend the hearing on account of illness

The following communication has not been published earlier since it was necessary to check the re numbering of certain lots as explained below

COMMISSIONERS OF THE DISTRICT OF COLUMBIA
EXECUTIVE OFFICE
WASHINGTON

A O 63,726

May 10, 1935

ORDERED

That the property of the AMERICAN PHARMACEUTICAL ASSOCIATION known as Lots 3, 4, 5 16, 17, 801, 802 806 and 807, Square 62, be exempted from general taxes as of January 1, 1934, and such exemption shall continue as long as said property is used for its present purposes, provided, that all taxes interest, etc against said property be paid to the date exemption is allowed

By order of the Board of Commissioners, D C

R M BRENNAN

Secretary to the Board

Official copy furnished

Mr E F Kelly, *Secretary*, AMERICAN PHARMACEUTICAL ASSOCIATION,
2215 Constitution Ave , N W

On account of the closing of Water Street between 22nd and 23rd Streets and the transfer of property between the United States of America and the ASSOCIATION in accordance with Public Resolution No 18, signed May 1932, and as set out in Council Letter No 3, 1932-1933, see JOURNAL, A PII A, Oct 1933, pages 1058 to 1065, it became necessary to renumber certain of the lots in Square 62 as shown on the plot plan printed on page 1063

The parts of Lots 12, 13, 14, 15 and 17 transferred to the United States as shown in red on the plan, are now numbered Lot 805 The remainder of these lots is now numbered Lot 806 The property transferred to the ASSOCIATION by the United States as shown in yellow on the plan and comprising part of the bed of Water Street and part of U S Reservation No 332B is numbered Lot 807

The order of exemption, therefore, covers all of the property owned by the AMERICAN PHARMACEUTICAL ASSOCIATION

Taxes on the property were paid including the first half of 1933-1934 or until March 1, 1934

101 Applications for Membership The following applications properly endorsed and accompanied by the first year's dues have been received

E F KELLY, *Secretary*

THE FORMULARY OF THE UNIVERSITY HOSPITAL UNIVERSITY OF MICHIGAN

The AMERICAN PHARMACEUTICAL ASSOCIATION is indebted to Harvey A K Whitney Chief Pharmacist of Ann Arbor Mich University Hospital, for a copy of the volume The formulary is very conveniently arranged and serves a useful purpose, not only for the pharmacist but for the physicians who are enabled to make use of Pharmacopœial and National Formulary preparations and for pharmacists to cooperate with them in the writing of prescriptions The book has been prepared in such a way that additional matter

can be added and without disturbing the order It is pleasing to note the care and study which has been given in arranging the book All measures have been recorded in the metric system and internal liquid preparations have been constructed on the basis of fifteen doses Prescriptions that generally may be ordered by title are frequently expressed in amounts on the basis of 100 so that percentage concentrations may be easily calculated The book appeals to us as well worth while and the arrangement throughout shows the study and care which the author has given to the compilation

EDITORIAL NOTES

SCHOOL OF PHARMACY OF OREGON STATE MONTHLY

The *Oregon State Monthly* issued a School of Pharmacy number. The first page of the text has a picture of the American Institute of Pharmacy and of President Robert P. Fischelis. Another article relates to the convention of three state conventions to be held in Portland during A. P. H. A. Convention week. Dean Adolph Ziefle speaks of pharmacy and the code of ethics and he also writes of pharmacy as a life vocation.

FEDERAL TRADE COMMISSION WRITING CODES

The Federal Trade Commission has announced its readiness to negotiate voluntary codes. The commission is writing 170 industries and it is said there is evident disposition to maintain standards. Industries now desiring codes are instructed to file applications describing briefly their business, what is expected of codes in the way of outlawing unfair methods of competition and the representative character of those applying.

EXCISE TAX CONTINUED FOR TWO YEARS

A new tax measure extends the excise tax for another two years and is in line with recommendation of the Ways and Means Committee to continue all present federal excise taxes two years, some additions have been made to the list of items taxed. Multiple taxation has been given consideration.

A NEW SECTION TO THE BRITISH POISONS LIST

The *Pharmaceutical Journal* of May 25, 1935, states that "since the Draft Poisons List and Rules were published in *The Journal* (British) no official communication has been made by the Poisons Board, nor is it yet known when the final report will be ready. An interesting indication of what may be expected so far as one class of drugs is concerned may be seen from a remark made by Sir William Willcox, a member of the Board, when he delivered the annual oration to the Medical Society of London. After showing how a variation in the pharmacological action of barbituric compounds follows the substitution of an ethyl

grouping by alkyl, phenyl or other radical, he stated that when the report of the Poisons Board was issued it would be seen that regulations are to be made limiting the supply of certain drugs of powerful therapeutic action, to medical prescription. The importance of this declaration will at once be recognized, it introduced a method of controlling the sale and supply of substances falling within the schedule similar to that in force under the Dangerous Drugs Acts. It is almost a certainty that all derivatives and compounds of barbituric acid which have been shown to possess habit-forming properties or danger from overdosage will be scheduled in this manner. Public opinion as expressed by some news papers, has demanded it even though it remains unmoved by the much larger number of accidental and suicidal fatalities from lysol and other cresylic disinfectants. What other drugs will in future be obtainable on prescription only we can only hazard a guess. Possibly the dimetrophenols which ought only to be taken under the closest medical supervision will be placed in this category, and to judge from the authoritative opinions expressed when phenylethynonamic acid was placed in the first part of the present Schedule of Poisons, it too, may be found in the new section. At present, however we can only conjecture, and, in common with all pharmacists, must await the report of the Board before knowing definitely what modification it is likely to make in our own business."

PHARMACY IN JAPAN

The Japanese Health Bureau of the Department of Home Affairs has recently announced the number of pharmacists and physicians at the end of 1933. The total number of pharmacists is given as 21,802, classified as follows: 14,847 engaged in the preparation of medicine and in the sale of medicine, 2371 engaged in the preparation of medical preparations in hospitals and clinics, and 1323 owners or managers of dispensaries.

Tokyo has the larger number of pharmacists numbering 5850 or 9.82 pharmacists for every 10,000 population. The total number of pharmacists throughout Japan is 3.24 pharmacists per 10,000 population.

The total number of physicians throughout Japan was given as 52,792.

PERSONAL AND NEWS ITEMS

The Minnesota State Pharmaceutical Association presented Dean Frederick J Wulling, in the form of an engrossed scroll, resolutions formally recognizing his distinguished work for pharmacy for a period of over fifty years beginning with March 10, 1884

Ragnar Almin and Charles V Netz were continued, respectively, as *chairman* and *secretary treasurer* of the Northwestern Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION at the last meeting of the Branch

Dr Edward Kremers, head of the department of pharmacy at the University of Wisconsin since 1892, retired from that position on June 30th He became a member of the AMERICAN PHARMACEUTICAL ASSOCIATION in 1887 and a regular contributor to the sections of the ASSOCIATION and father of the Section on Historical Pharmacy, he is a member of American and foreign historical societies

Dr Kremers is an international authority on volatile oils member of many American and foreign pharmaceutical and chemical organizations and author of many papers on chemistry and drugs He has been at the University since 1890 He is the author of the English edition of *Gildemaister-Hoffman Kremers—"The Volatile Oils"*

Dr Kremers earned his Ph D degree at the U of Gottingen, he graduated in Pharmacy at the University of Wisconsin and received the Ph M from the Philadelphia College of Pharmacy

Lawrence W Renner, secretary of Stark Co (Ohio) Pharmaceutical Association, has completed a study of law and received a degree of LL B Mr Renner is a graduate pharmacist

Idaho State Pharmaceutical Association has issued a bulletin carrying the greater part of an interesting paper by Dean Eugene O Leonard The paper dealt with the early history of pharmacy, bringing it to modern times and pointing out some of the important services which the pharmacist renders and how necessary it is to give the most careful attention to pharmaceutical practice Professor Leonard pointed out the importance of cleanliness and careful business practice

The Alabama Association Registration List includes three of its Veterans, namely L C Lewis, Tuskegee J W Durr, Montgomery, and Samuel Williams, Troy

John A Weeks and Booker T Latimer, mem-

bers of the Texas and Arkansas Board of Pharmacy, respectively, will retire after having served as board members for twenty five years or more

Mr and Mrs J T Coulson, Mr and Mrs C J DeWoody of Dallas, Texas and Mr and Mrs Charles Sutton of Merck & Co, drove to the city of Mexico for a vacation

E von Hermann, of Chicago celebrated his 81st birthday this month He still gives attention to the work of his pharmacy on the 14th floor of a Chicago office building

Herbert W Parker, of Jonesboro, member of the Arkansas Board of Pharmacy, is being urged for Governor

W M Hankins was guest-speaker at a dinner at the University of Florida His subject was—"The Importance of the Little Things in Pharmacy" Mr Hankins took the initiative for the establishment of the School of Pharmacy He is a former president of the National Association of Boards of Pharmacy and of Florida Pharmaceutical Association The dinner was sponsored by the Rho Chi Society

J W Gayle, Kentucky, holds the record of tenure in office as secretary of a State pharmaceutical association He has been secretary of Kentucky Pharmaceutical Association for 47 years

Dean Charles H LaWall was taken seriously ill while on an automobile trip and is now in a Harrisburg Pa hospital where he is slowly recovering Professor LaWall was to have sailed for Copenhagen on July 3rd, to attend a meeting of the Committee upon Uniform Method of Opium Assay, as representative of the U S Treasury Department Regret is expressed because of his illness and inability to serve on the important committee He was also to be delegate at several pharmaceutical meetings representing the AMERICAN PHARMACEUTICAL ASSOCIATION

THE ITALIAN PHARMACY ACT

The Italian Pharmacy Act has been revised Among the requirements a pharmacy must carry all the medicaments of the Pharmacopœia Inspection of the pharmacy in various details is provided It is also provided that the pharmacy must have a Pharmacopœia for use by the public

OBITUARY

C P VAN SCHAACK

Cornelius Peter Van Schaack, member of the AMERICAN PHARMACEUTICAL ASSOCIATION since 1905, vice-president of Van Schaack Mutual, Inc., wholesale druggist, Chicago, died at his home in Wilmette, a suburb of Chicago, July 2nd

Mr Van Schaack was born May 26, 1863, in Manlius, N Y He engaged with George H Schaefer & Co in Madison, Ia, and several years later, about 1882, with a brother Robert H, he became associated with their father, Peter Van Schaack, in the wholesale drug business in Chicago, started by Brinkerhoff & Penton The father had entered the business in 1870 In 1885 the firm name became Peter Van Schaack & Sons and under this name the business was incorporated in 1900, a merger was effected under the Roosa-Ellis plan and the name of 'Mutual Drug Company of Chicago,' Mr Van Schaack became vice-president but retired in 1933, after fifty four years of active connection with the wholesale drug business

The deceased became a member of the AMERICAN PHARMACEUTICAL ASSOCIATION in 1905 and was deeply interested in its activities, Mrs Van Schaack joined him in the membership The latter survives with three sons, Cornelius Peter Harding Byford and Eric Van Schaack

MARION DORSET

Dr Marion Dorset—known for development of a hog cholera serum, the tuberculin test for

milk cows and other work for the Department of Agriculture—died at his home in Washington, July 14th He also developed a serum for the prevention of virulent diarrhea in poultry He had been with the department since 1894, and at his death was chief of the bio-chemical division

The deceased was born in Columbia Tenn December 14, 1872 He studied at George Washington University and at the University of Pennsylvania receiving his M D degree at the former institution He was a member of the American Public Health Association the American Chemical Society and the Society of American Bacteriologists He was a fellow of the American Association for the Advancement of Science

HAROLD W SIMPKINS

Harold Winslow Simpkins, treasurer and general sales manager of the Mallinckrodt Chemical Works, St Louis, died July 11th, after a prolonged illness

Mr Simpkins was born in St Louis, August 16 1885 After attending Smith Academy St Louis, he prepared at St Paul School Concord, N H, and entered Harvard University He was graduated with the degree of bachelor of science in 1907 In 1917 he went with the Mallinckrodt Chemical Works, and in 1925 he became treasurer and sales manager He succeeded H W Hunning as general sales manager, January 1, 1931

TENNESSEE PHARMACEUTICAL
ASSOCIATION

Tennessee Pharmaceutical Association is making preparations for its Golden Anniversary meeting July 15th to 18th in Memphis under the direction of Edward Sheely The *Southeastern Drug Journal* for July contains a complete list of the former presidents of the Association, beginning with 1886

The Commencement Exercises of Western Reserve University School of Pharmacy were presided over by Dean Edward Spease and the principal address of the evening was made by Dean C B Jordan.

THE COPELAND BILL HEARING

Congressional leaders were urged by President Roosevelt July 15th, to pass legislation at this session strengthening the pure food and drug laws

This information was given to the House Interstate Commerce Committee by Chairman Rayburn who will have charge of the Senate approved Copeland bill

Representative Chapman of Kentucky is Chairman of the Sub Committee in charge of the hearings The same announcement stated that the committee will have before it two other bills—the Mead and Sirovich measures

Hearings started July 22nd

THE GENERAL SESSIONS OF THE
AMERICAN PHARMACEUTICAL
ASSOCIATION

SESSIONS, WEDNESDAY AUGUST 7TH, 9 00 A M
THURSDAY AUGUST 8TH, 2 00 P M FRIDAY,
AUGUST 9TH 8 00 P M

First General Session, Wednesday, August 7th,
9 00 A M —Main Ball Room

- 1 Call to Order
- 2 Reading of Communications
- 3 Annual Report of the House of Delegates, Rowland Jones Jr, *Chairman*
- 4 Address of the President, Robert P Fischelis
- 5 Unfinished Business
- 6 New Business
- 7 Report of the Committee on Maintenance, H A B Dunning, *Chairman*
- 8 Address, The Practical Value to the Pharmacists of the Activities of the Council on Pharmacy and Chemistry of the American Medical Association Joseph A Pettit
- 9 Address Dentistry and Pharmacy " Dr P T Meany

Second General Session, Thursday, August 8th,
2 00 P M —Main Ball Room

- 1 Minutes of the First General Session
- 2 Reading of Communications
- 3 Report of the House of Delegates on the President's Address and Other Matters, Rowland Jones, Jr, *Chairman*
- 4 Address, 'The United States Pharmacopœia and the Federal Food and Drugs Act' James H Beal
- 5 Report of the Special Committee on The Council on Pharmaceutical Practice," E F Cook *Chairman*
- 6 Address 'Prescription Department Economics—Some High Lights of the Revised Edition of the Professional Pharmacy" (with lantern slides), Frank A Delgado
- 7 Symposium on Prescription Pricing
- 8 Unfinished Business
- 9 New Business

Third General Session, Friday, August 9th
8 00 P M —Main Ball Room

- 1 Minutes of the Second General Session
- 2 Reading of Communications
- 3 Final Report of the House of Delegates
- 4 Unfinished Business
- 5 Award of the Ebert Prize
- 6 Installation of Officers
- 7 Address of the President
- 8 Final Adjournment

COUNCIL OF THE AMERICAN PHARMA-
CEUTICAL ASSOCIATION

All sessions will be held in the Cameo Room

Officers and Members of the Council — *Chairman*, S L Hilton, *Vice Chairman*, James H Beal, *Secretary*, E F Kelly, Robert P Fischelis, C W Holton, Oscar Rennebohm, George D Beal A G DuMcz E G Eberle H V Army, H C Christensen Walter D Adams, H A B Dunning W Bruce Philp, Charles H LaWall C E Caspari

SESSIONS

A meeting will be called Saturday, August 3rd 10 00 A M—if no quorum is present the meeting will be called Sunday, August 4th, at 10 00 A M Other meetings are scheduled for Thursday 9 00 A M and Friday, 10 00 P M

HOUSE OF DELEGATES OF THE A P H A

OFFICERS

Chairman, Rowland Jones, *Vice Chairman*, S A Williams, *Secretary*, E F Kelly

First Session, Tuesday, August 6, 1935, 1 30 P M—Grand Ball Room

- 1 Call to Order
- 2 Roll Call of Delegates
- 3 Reception of Fraternal Delegates
- 4 Opening Remarks by the Chairman Rowland Jones, Jr
- 5 Appointment of Committee on Nominations
- 6 Appointment of Committee on Resolutions
- 7 Annual Report of the Council, E F Kelly, Secretary
- 8 Report of the Treasurer, C W Holton
- 9 Report of the Secretary, E F Kelly
- 10 Reports of Delegates to Other Organizations (including International Pharmaceutical Federation, American Association for the Advancement of Science and National Drug Trade Conference)
- 11 Receipt of Resolutions, Reports and Other Communications—all of which must be in writing
- 12 New Business

Second Session, Wednesday, August 7, 1935, 8 00 P M—Grand Ball Room

- 1 Roll Call of Delegates
- 2 Reading and Adoption of the Minutes of the First Session
- 3 Receipt of the Address of the President of the AMERICAN PHARMACEUTICAL ASSOCIATION
- 4 Receipt of Reports and Other Communications from the Association, Council and Sections
- 5 Receipt of Resolutions Reports and Other Communications—all of which must be in writing
- 6 Reports of the Committees on the Study of Pharmacy, R P Fischelis, on Cosmetics, H C Muldoon, on Local Branches Adolph Ziefle, on Legislation, Ambrose Hunsberger, on U S Pharmacopœia C C Glover, on Pharmaceutical Syllabus J C Beard, on Pharmacy Week, Anton Hogstad, Jr, on Horticultural Nomenclature H W Youngken, on Physiological Testing, J C Munch, on Weights and

Measures, P H Costello, on William Procter, Jr, Memorial Fund, J E Hancock, on International Pharmaceutical Nomenclature, A G DuMez

- 7 Election of the Honorary President, Secretary and Treasurer of the Association upon Nomination by the Council
- 8 Report of the Committee on Nominations
- 9 Report of the Committee on Place of Meeting
- 10 Report of the Committee on Resolutions
- 11 Unfinished Business

Third Session, Friday, August 9, 1935—2 00 P M—Grand Ball Room

- 1 Roll Call of Delegates
- 2 Reading and Adoption of the Minutes of the Second Session
- 3 Receipt of Reports and Other Communications from the Association, Council and Sections
- 4 Reports of the Committees on Press Relations, E F Kelly, on Pre requisite Legislation C B Jordan, on Endowment Fund, J H Beal, on Pharmacy Corps in the U S Army H E Kendig, on Transportation, T J Bradley, on Prescription Tolerances, H H Schaefer to Draft Model Act Restricting Distribution of Drugs and Medicines to Pharmacists, W B Philip on National Code Matters, E F Kelly, on Professional Relations, L A Seltzer, on Development of Pharmacy Laws, R L Swain, on State Codes, C L O'Connell, on Council on Pharmaceutical Practice E F Cook
- 5 Final Report of Committee on Resolutions
- 6 Unfinished Business
- 7 Installation of the Chairman and Vice-Chairman of the House of Delegates
- 8 Final Adjournment

SCIENTIFIC SECTION

OFFICERS

Chairman, E V Lynn, *First Vice Chairman*, H M Burlage, *Second Vice-Chairman* R E Schoetzow, *Secretary*, F E Bibbins, *Delegate to the House of Delegates*, L W Rowe

First Session, Wednesday, August 7th, 2 00 P M—Assembly Hall

Program

- 1 Chairman's Address E V Lynn
- 2 Secretary's Report, F E Bibbins

- 3 Committee Reports, Board of Review of Papers, F E Bibbins, *Chairman*
Committee to Cooperate with the National Conference on Pharmaceutical Research, John C Krantz, Jr, *Chairman*
Committee on Monographs, E E Swanson, *Chairman*
- 4 Appointment of Nominating Committee
- 5 General Business
- 6 Papers

'A Note on the Action of Alkalies and Alkali Salts on Antipyrine" Loyd E Harris and Ercell D Tehow

'The Tests for Redistilled Water in the National Formulary VI Monograph," R S Adamson, R K Snyder and E N Gathercoal

"A Note on the Assay of Mass of Ferrous Carbonate," John C Krantz, Jr, and C Jelleff Carr

'A Simplified Assay for the Official Iodine-Iodide Solutions," William F Rein-dollar

"The Bacteriocidal and Bacteriostatic Value of Colloidal Cadmium Proteinate" W A Lott and W G Christiansen

'Antiseptic Solutions" Esther Meyer and E N Gathercoal

'Antiseptics—a Comparative Study of Laboratory and Practical Tests," George F Reddish

Comparison of Nessler's Reagent Test with Other Tests for Aldehydes in Ether," E C Billheimer, F VanDeripe, F F Berg and F W Nitardy

'A Modified Nessler's Reagent Test for Aldehydes in Ether' E C Billheimer, F VanDeripe, F F Berg and F W Nitardy

The Official Sulphur Ointments and Their Assay," Henry M Burlage and Charles E Brady

Bismuth-Sodium Potassium Tartrate Solutions" A H Clark

'A Further Note on the Stability of Sodium Sulphite" A H Clark and Solomon Gershon

"A Rapid Method for Standardizing Silver Nitrate Volumetric Solution," Robert D'Orazio

'Studies on the Determination of Camphor in Camphor Liniment IV The Use of Antioxydants" Chas F Poe

"The Addition of Strong Hydrogen Peroxide in the Determinations of Nitrogen in Organic Compounds," Chas F Poe and Bartlett T Dewey

'Dature Acid, a Literature Review" Ralph W Clark

A Study of the U S P Thyroid Assay," George D Beal and Chester R Szalkowski

The Assay of Official Preparations for Phenol," Glenn L Jenkins and Melvin H Dunker (Presented by title)

'Observations on Opium Assay" Joseph Rosin and C J Williams

"Opium Assay, Assay Hydrolysis Method for" G E Mallory and Peter Valaer, Jr (Presented by title)

"The Assay of Official Syrups Containing Hypophosphites" Glenn L Jenkins and Charles F Bruening (Presented by title)

'The Assay of Official Hypophosphite Salts," Glenn L Jenkins and Charles F Bruening (Presented by title)

'Organic Medicinal Preparations Containing Arsenic, the Assay of" Edward J Hughes (Presented by title)

'Some Mercurated Derivatives of Thymol and Carvacrol" Joseph B Burt (Presented by title)

'Mercury Derivatives of Azo Dyes," Wm Braker and W G Christiansen

Phenyl Mercury Nitrate and Some Other Phenyl Mercury Salts" T B Grave, S E Harris and W G Christiansen

Second Session, Thursday, August 8th, 9 00 A M —Assembly Hall

7 Papers

'Studies on the Pharmacology of Trichlor ethylene ' John C Krantz, Jr, C Jelleff Carr and Ruth Musser

Absorption of Drugs by the Human Skin," A Richard Bliss Jr

The Effectiveness of Theelol by Oral Administration" L W Rowe and A E Simond

Notes on the Colorimetric Assay of Digitalis by the Knudsen and Dreshach Method ' F A Upsher Smith

'Comparison of Six Methods in Assaying the New Ergot Principle" Edward E Swanson, Chester C Hargreaves and K K Chen

- 'F E Ergot—Apparent Increase in Activity Due to Acid,' F F Berg
- "A Toxicological Study of the Cutaneous Secretions of the Salamander, *Triturus torosus* (Rathke)," Ernst T Stuhr
- 'Dialkyl Amino Acetylureas,' F C Daniels
- "A Study of the Assay of Aconite and the Stability of Its Preparations," Geo L Baker and C B Jordan
- The Fatty Oil of Podophyllum Peltatum, 'Arthur H Uhl
- 'Evaluation of a Deterioration Factor in Liquid Petrolatum,' P L Burrin, A G Worton and F E Bibbins
- 'A New Silver and Mercury Colloidal Compound,' Earl Voelker
- "Modern Pharmaceutical Research Problems," Henry J Goeckel
- 'Some Thymol Derivatives of Possible Medicinal Value,' F A Gilfillan and John R Merritt

SECTION ON PRACTICAL PHARMACY AND DISPENSING

(PHARMACOPŒIAS, FORMULARIES AND STANDARDS)

OFFICERS

Chairman H M Burlage, *First Vice Chairman* L W Rising *Second Vice-Chairman*, Frank L Black *Secretary*, Leon W Richards, *Delegate to the House of Delegates* R W Clark

First Session, Thursday, 9 00 A M —Grand Ball Room
Program

- 1 Chairman's Address H M Burlage
 - 2 Secretary's Report Leon W Richards
 - 3 Report of the Committee on Prescription Tolerances for 1934-1935, H H Schaefer
 - 4 Appointment of Committees
 - 5 Papers
- "New Standards for Medicinal Carbon in U S P XI," Joseph Rosin, Geo D Beal and Chester R Szalkowski
- Foresight in Professional Pharmacy," Ernest T Stuhr
- "Dentistry and Pharmacy as Cognate Professions " Raymond P LeRoy
- 'Is Extemporaneous Pharmacy a Moribund Art? ' Wm F Reindollar
- 'Back to Pharmacy " Roy A Perry
- 'Manufacturing and Marketing Toilet Products from Your Own Laboratory," Alex F Peterson, Jr

'New Products and the Problems They Present," Ronald V Robertson

'The Stabilization of Milk of Magnesia by Citric Acid," E C Billheimer, F F Berg and F W Nitardy

Comparison of Spectrometric and Antimony Trichloride Methods for the Estimation of the Vitamin A Potency of Fish Liver Oils," W S Jones, F F Berg and W G Christiansen

Study on Washing of Milk of Magnesia through a Permeable Membrane," E Moness, W A Lott, F F Berg and W G Christiansen

"A Service That Built a Prescription Business," L D Bracken

"The Need of Greater Care in the Dispensing of Potent Medicinal Substances in the Form of Sugar Coated Pills in Confections," John F Suchy

Problems of Retailing," Roy A Perry

"The Hospital Pharmacist Work in Southern California," P W Howard

"The Hospital and the Pharmacist Some Observations in Establishing a Department of Pharmacy," H C McAllister

"A Plan for Pharmacy Internships at the University of Michigan Hospitals," Harvey A K Whitney¹ and E C Watts

"Practical Pharmacy Problems," Carl Gibson

'The Physician and the Pharmacist," Ralph W Clark

'Ointments " Ralph W Clark

Second Session, Friday, 2 00 P M —Grand Ball Room

'The Preparation of the Resin of Podophyllum " Arthur H Uhl

"Hydrophile Petrolatum," Bernard Fantus and Hattie Dymewicz

'Improvement in Technique in the Preparation of Three Common Products " Edward D Davy

"Tincture of Opium—Process to Reduce Precipitation," P L Burrin and F E Bibbins

"Studies on Three U S P and N F Preparations by Shortened Procedures" Henry M Burlage with W J Smith

Suggested Changes in Three Official Preparations," C L Cox

'Modernized Progress of Pharmacy in the

Realms of Dispensing," C George Hamilton

"Errors in Methods Used for Testing Enteric Coatings," F S Bukey and C W Bliven

The Percentage Preparation " Ralph Bienfang

'A Table of Equivalents," Ralph Bienfang

'Percentage Solutions " Earl Gunther
It Can Be Done Difficult Preparations
Series No IV," J Leon Lascoff

'Pharmaceutical and Chemical Incompatibilities," Geo L Secord

'Prescription Problems," Thomas G Wright
Dropper for Tincture Digitals," R A Konnerth, R E Schoetzow and F F Berg

Assay of Liniment of Camphor," D A Overby R E Schoetzow and F F Berg

Joint Session with the Scientific Session, Thursday, August 8th, 8 00 P M —Assembly Hall

(See order under Scientific Section)

- 6 Report on U S Pharmacopœia, E Fullerton Cook (20 minutes)
- 7 Report on National Formulary, E N Gathercoal (15 minutes)
- 8 Report of Recipe Book, J Leon Lascoff (10 minutes)
- 9 Report of Committee on Glass Standardization, H V Army (10 minutes)
- 10 Report of Committee on Ebert Prize, G L Jenkins
- 11 Report of Committee on Unofficial Standards John C Krantz Jr
- 12 Report of Committee on Collection of Information Pertaining to Professional Pharmacy, Marvin J Andrews
- 13 Report of Committee on Prescription Tolerances
- 14 Papers
Daphnia—the Living Reagent" (with Motion Picture) Arno Viehoever

SECTION ON EDUCATION AND LEGISLATION

OFFICERS

Chairman Oscar E Russell, Vice Chairman
Charles W Ballard, Secretary L W Rising,

¹ Chief Pharmacist

Assistant Chief Pharmacist

Delegate to the House of Delegates, George C Schicks

First Session, Wednesday, August 7th, 2 00
P M—Colonial Room

- 1 Chairman's Address, Oscar E Russell
- 2 Secretary's Report, L Wait Rising
- 3 Report of the National Dental Committee, G C Schicks
- 4 Report of the Committee on Cooperation with Hospital Pharmacists R W Rodman
- 5 General Business (Committee appointments, etc.)
- 6 Papers
 - 'Things to Be Considered in the Promotion of Official Products' Marvin J Andrews
 - 'What Price Prescriptions?' F C Felter
 - 'Your Opportunity for Publicity,' Howard Stephenson
 - 'Development of Pharmaceutical Education and Legislation in Georgia' A discussion Robert C Wilson
 - 'Entangling Alliances,' Wortley F Rudd
 - 'The Changing Attitude of Government toward Professional Pharmacy,' Arthur D Baker
 - 'Students, Deans Druggists and Legislators,' E J Parr
 - 'Undergraduate Research' Lawrence H Baldinger
 - 'Substitution an Unnecessary Evil' J Norman Salsby
 - 'A Limited Enrollment Selective Plan,' A Richard Bliss Jr

Second Session, Friday, August 9th, 9 00 A M
—Assembly Hall

- 'Problems in Pharmaceutical Education,' H B Carey
- Presentation of Basic Sciences in Colleges of Pharmacy,' T C Daniels
- Questions Testing the Recognitive Faculties of Students,' J H Goodness
- 'The Fate of the Pharmacist under State or Socialized Medicine,' J H Kidder
- Fair Trade Legislation,' Frank A Mortenson
- 'Why Pharmacy Legislation Fails,' Hugh P Berne
- 'The Pharmacist and the Pediatricist' W F Ambroz
- 'National Unity of State Cooperation between Pharmacists and Physicians' G C Schicks
- 'Pharmacy Legislation in Mississippi' Lew Wallace.

"Discussion of Education and Legislation," W Mac Childs

- 'A Practical Method of Increasing the Prestige of Pharmacy as a Profession,' L Wait Rising
- 7 Unfinished Business
- 8 Report of Committee
- 9 Election and Installation of Officers
- 10 Adjournment

SECTION ON COMMERCIAL INTERESTS

OFFICERS

Chairman, Henry Brown, Vice Chairman, Robert W Rodman, Secretary, R T Lahey, Delegate to the House of Delegates John A J Funk

First Session, Wednesday, August 7th, 2 00
P M—Marine Room

- 1 Chairman's Address, Henry Brown
- 2 Report of Secretary, R T Lahey
- 3 Appointment of Committees
- 4 Papers
 - 'The Pharmacist Studies Law,' Charles G Ajax
 - 'How to Help the Pharmacist Commercially,' Eugene C Brokmeyer
 - A Study of the Commercial Pharmacy Curriculum,' Neal Bowman
 - 'What Determines Net Profit?' C Leonard O Connell
 - 'The Fair Trade Acts and Their Effects,' Paul C Olsen
 - 'The Selling Price of Prescriptions' Frank A Delgado
 - 'The Open-View Prescription Department,' Frank A Delgado
 - 'Merchandising Your Profession' Ralph A Beegle
 - 'The Need of Commercial Training in Colleges of Pharmacy,' Ralph A Beegle
 - "Dogs Cats Birds and Babies," Alice-Esther Garvin

Second Session, Thursday, August 8th, 2 00
P M—Marine Room.

- 'The Futility of Cutting Prices and a Comparative Price Survey of Two States—One with a Price Maintenance Act,' George M Archambault
- The California Fair Trade Act' Ira Darling (University of California)
- 'A Scientific Study of the Merchandising Value of Windows' F A Geue
- 'A Comparison of the Ratios of Wisconsin

Drug Stores at the Time the State Pharmacy Law Was Passed and at Present," Minnie Myers and Edward Kremers

Vaccines and Serum Products of the U S P XI," Clarence M Brown

'Questions Testing the Recognitive Faculties of Students," Joseph H Goodness

5 Unfinished Business

6 Report of Committees

7 Election and Installation of Officers

8 Adjournment

SECTION ON HISTORICAL PHARMACY

OFFICERS

Chairman, C O Lee, *Secretary*, H W Youngken, *Historian*, Eugene G Eberle

SESSIONS WEDNESDAY, AUGUST 7 2 00 P M AND

THURSDAY, AUGUST 8, 9 00 A M

Program

Wednesday, 2 00 P M , First Session—Rose Room

1 Address by the Chairman

2 Report of the Historian

3 Report of the Secretary

4 Papers—Subject to rearrangement

A Brief History of the Drug Code,' E F Kelly

'Pharmacy and a Commemorative Stamp " Illustrated by Lantern Slides, F A Delgado

'The First Pharmacist in North America," Theodore J Bradley

'William Withering and the Introduction of Digitalis into Medical Practice," Louis A Roddis

'Moses Maimonides, Physician and Author of Medical Works," Louis Gershenfeld
David Henshaw—from Druggist to Secretary of the Navy," George E Ewe

'John Marsh, a Medico Pharmaceutical Practitioner on Six Frontiers," Edward Kremers

'Early Drug Stores in Oklahoma," Loyd E Harris

The Pharmacopœia of 1880," L M Parks

'The Massachusetts Pharmacopœia of 1808," Edward H Niles

'The Californian Indians, Their Medical Practices and Their Drugs " John Culley

'Estonian Pharmacy," Rudolph Wallner ¹

5 Appointment of Nominating Committee

Thursday, August 8th, 9 00 A M , Second Session—Rose Room

State Association Secretaries, arranged in order of service, J G Beard

Medical Practices of the New England Indians," Will T Bradley

Pioneers of Pharmaceutical Education in the United States ' Ernst T Stuhr

"A History of Dentifrices " Martha E Faulk

Apothecary Shops of Colonial Times," Millicent R LaWall

Medicine Making as Depicted by Museum Dioramas," Charles Whitebread

'Honoring Age and Service " John E Kramer

Report of the Pharmacy Exhibit for 1933 and 1934," H C Christensen

Drugs of the Bible," A R Bliss Jr

The Ancient Medicinal Uses of Gums and Precious Stones " A R Bliss, Jr

History of the Dorfinger Druggists Show Globes," R W Rodman

The Pharmaceutical Museum at the University of Minnesota," F J Wulling

Mandragora," W H Blome

Other papers to be announced

6 Report of Nominating Committee

7 Election and Installation of Officers

8 Adjournment

CONFERENCE OF PHARMACEUTICAL ASSOCIATION SECRETARIES

OFFICERS

President F V McCullough *First Vice President* J W Slocum, *Second Vice President* Roy C Reese *Secretary Treasurer*, Carl G A Harring, *Delegate to the House of Delegates*, C J Clayton, *Members of the Executive Committee*, J Lester Hayman J J Gill, Roy Reese ¹ W E Bingham ¹

The President will announce further items and changes

SESSIONS

First Session Wednesday August 7th, 2 00 P M , Joint Session, Section on Education and Legislation Conference of Pharmaceutical Law Enforcement Officials, Thursday, August 8th 8 00 P M , Second Session Conference of Pharmaceutical Association Secretaries 9 00 A M

¹ Retail Estonian pharmacist

¹ Deceased

First Session, Wednesday, August 7th, 2 00 P M —Club Room

- 1 Call to Order
- 2 Remarks of Chairman F V McCullough
- 3 Report of Secretary, Carl G A Harring
- 4 Calling of Roll by Secretary
- 5 Report of Committee on Constitution and By Laws
- 6 Address, "The N A R D Washington Bulletin to Association Secretaries" Rowland Jones

The Conference of Pharmaceutical Association Secretaries will try the plan of having no papers read but, instead devote the sessions to round table discussions of timely topics. A list of topics follows, which may be added to

TOPICS

The Progress in Affiliation of Associations Representing Organized Pharmacy," and a review of the findings of the joint committee representing the N A R D A P H A and State Secretaries at the Washington Conference

Joint Session with Section on Education and Legislation and Conference of Pharmaceutical Law Enforcement Officials, Thursday, August 8th, 8 00 P M —Junior Ball Room

Topics for Discussion to be provided
Reports on enacted and proposed legislation in various states

Second Session, Friday, August 9th, 9 00 A M —Club Room

The Secretary's Obligation to the Industry in Promoting Sound Business and Fair Trade Practices " Discussion led by J W Slocum

The Secretary's Obligation to the Profession in Promoting the Professional Phase of the Practice of Pharmacy ' Discussion led by R C Wilson

' The Secretary's Obligation to the Industry and Profession in Sponsoring State and National Legislation " Discussion led by Roy S Warnack

- 7 New Business
- 8 Election of Officers

CONFERENCE OF PHARMACEUTICAL ASSOCIATION LAW ENFORCEMENT OFFICIALS

The chairman will announce additions and changes

OFFICERS

Chairman R L Swain, Secretary M N

Ford, *Delegate to the House of Delegates*, Fred Schaefer

SESSIONS

First Session, Thursday August 8th 9 00 A M Thursday August 8th, 8 00 P M, Joint Session, Section on Education and Legislation and Conference of Pharmaceutical Association Secretaries Second Session Friday, August 9th, 9 00 A M

Program

(Changes may be made if deemed necessary and expedient)

First Session, Thursday, August 8th, 9 00 A M —Club Room

- 1 Call to Order
- 2 Remarks by Chairman Robert L Swain
- 3 Report of Secretary M N Ford
- 4 Report of Finance Committee
- 5 Pharmacy Law Enforcement in Washington Oregon and Idaho Harry C Huse Director of Licenses Washington, Linne E Jones Secretary, Oregon Board of Pharmacy Frank L Christenson, President Idaho Board of Pharmacy
- 6 Report of New Legislation Affecting the Control of Pharmacies, Pharmacists and the Manufacture and Distribution of Drugs and Medicines

Robert P Fischelis, New Jersey
George W Mather, New York
Robert L Swain Maryland
W Mac Childs Kansas
P H Costello South Dakota
Edna E Gleason California
R C Shultz Wyoming
J A Riedel Montana
R W Fleming Nevada
A L I Winne Virginia
Roy B Cook, West Virginia

- 7 Round Table Discussion
Is It Advisable to Give Boards of Pharmacy Authority to Limit the Number of Students Entering Courses in Pharmacy?
Should Boards of Pharmacy be Empowered to Regulate the Number of Drug Stores, and, if So, What Shall Be the Basis of Such Regulation?
What Can Be Done to Further Restrict to Pharmacists the Distribution of Potent Drugs and Medicines and Medicines in General?
Have the Barbituric Acid Laws" Worked Out Satisfactorily?

Should Law Enforcement Officials Attempt Some Program Looking to Supervised Experience?

What Enforcement Difficulties Have Been Met with under the Uniform State Narcotic Act?

The Requirements for Drug Store Permits

- 1 U S P and N F
- 2 Apparatus and Equipment
- 3 Sanitation
- 4 Personnel
- 5 Etc

Joint Session with Section on Education and Legislation and Conference of Pharmaceutical Association Secretaries, Thursday, August 8th, 8 00 P M —Junior Ball Room

- 8 Election and Installation of Officers
- 9 Unfinished Business
- 10 Adjournment

STATE PHARMACEUTICAL ASSOCIATION OFFICERS

ALABAMA

N G Hubbard, former president of the Birmingham Association of Retail Druggists, was advanced to the presidency of the Alabama Pharmaceutical Association. Other officers for the ensuing year are *First Vice-President*, Sam Watkins, Dora, *Second Vice President*, E M Megginson, Mobile, *Treasurer*, W H Ward, Tuscaloosa, *Secretary*, Z C Lewis, Montgomery

ARKANSAS

Lew Wallace, of the Mississippi Pharmaceutical Association, addressed the Arkansas Association on the subject "Mississippi's program on U S P and N F Propaganda." The resolutions committee's report was received with enthusiasm, also that on the outstanding endorsement of Herbert Parker for governor of Arkansas. Officers elected and installed include *President*, J E Berry, Smackover, *Vice-Presidents*, Charles Dana Gibson, Hope, and Guy Elkins, Booneville, *Treasurer*, Troy Churchman, North Little Rock, *Secretary-Manager*, Irl Brite, Little Rock, *Sergeant at-Arms*, W R Griffin, Heber Springs, *Place of Meeting*, Little Rock, *Time*, 1936

CALIFORNIA

The following officers were elected for the ensuing year by California Pharmaceutical Association. *President*, Wm Rutherford, Santa Rosa, *First Vice-President*, Charles R

Seward, Pasadena, *Second Vice-President*, Louis Fischl, Berkeley, *Third Vice President*, T D Perkins, San Diego, *Treasurer*, John G Wagner, Long Beach, *Executive Secretary*, Roy S Warnack, Los Angeles

Assembly Bill 1870—the fair trade practice act, and Assembly Bill 2365—the chain store tax bill are most important bills so far as individual merchants and fairness in merchandising are concerned. Senate Bill 229 amends the State Narcotic Act. The most important change is as follows: "Within 24 hours after any purchaser in this state gives an order to, or makes any contract or agreement for purchases from or sales by, an out of state wholesaler or manufacturer of any narcotic drugs specified in Section 1 of this act for delivery in this State, such purchaser shall forward to the State Division of Narcotic Enforcement by registered mail, a true and correct copy of the order, contract or agreement."

COLORADO

The officers elected for the ensuing year are *President*, Paul G Stodghill, Denver, *First Vice-President*, Clyde C Phillips, Jr, Colorado Springs, *Second Vice-President*, H Rodney Anderson Montrose, *Treasurer*, V N Lagerquist, La Junta, *Secretary*, Chas J Clayton, Denver

INDIANA

A session of Indiana Pharmaceutical Association was given over to the "Keeping Up of the Profession." Another to the theme "Keeping Profits Up." The subjects were "Club Selling," "Profitable Store Arrangement and Displays," "Profitable Advertising and Small Town Druggists."

Officers elected for the year are *President*, H W Miller, *Vice Presidents*, G D Revington, R E Thornburg and Charles E Reed, Herbert H Gerding and Retiring *President* E N Harper are new *Executive Committeemen*. *Secretary* F V McCullough and *Treasurer* Harry J Borst were re elected.

MARYLAND

District of Columbia pharmacists joined members of the Maryland Pharmaceutical Association in the annual convention. Much attention was given to the Fair Trade Act, R L Swain gave an analysis of this important legislation and others added to his remarks. Among speakers on this and other subjects were W Bruce Philip, E F Kelly, A G DuMez and others.

Marvin J Andrews reported on tolerances in prescription practice, A H Bryan presented a paper on antiseptic action of ointments and face creams, J Leon Lascoff explained "how it could be done" in the presentation of another paper to the helpful series begun several years ago

The program was made up of interesting studies and well and favorably known speakers, among others, besides those mentioned were Dean W Paul Briggs, Rowland Jones Marvin R Thompson

The Governor of Maryland and the Mayor of Baltimore were named on the program as banquet speakers Hugh Craig, of the *Oil Paint and Drug Reporter*, chose as his subject "The Need for Economic Harmonies"

The associations heard the discussions of subjects of timely importance by two presidents who had given time and study to conditions affecting pharmacy and the drug business President Andrew F Ludwig delivered his address the second day of the convention and President A C Taylor on the following day

The officers chosen for the ensuing year are *President*, H W Matheney, Cumberland *Vice Presidents* Melville Strassburger, Baltimore, and H A M Dewing, Centerville, *Secretary*, E F Kelly, *Treasurer*, Harry S Harrison, *Members of Executive Committee*, C C Neal, W B Spire L V Johnson Andrew F Ludwig, Aquilla Jackson John Wannan wetsch, *Editor, Maryland Pharmacist*, R L Swain Alfred E Pearre Frederick, *Honorary President*

MICHIGAN

The new officers of the Michigan Association are *President* Benjamin Peck of Kalamazoo, *First Vice-President*, Joseph Maltas of Sault Ste Marie *Second Vice-President* James Lyons Detroit, *Secretary*, Clare Allan Wyandotte, *Treasurer*, Henry Hadley of Benton Harbor Ray Jensen of Grand Rapids and Peter McFarlane of Lansing are members of the *Executive Committee*

MISSISSIPPI

Mississippi adopted a resolution urging abolition of the state sales tax The following officers were elected *President* J S Puller, Starkville, *First Vice President* W J Cox, Nettleton, *Secretary-Treasurer*, S B Key, Jackson, *Executive Committeemen* are H B McInnis Lumberton, G C Roberts Greenwood, and Lew Wallace Laurel

NEW HAMPSHIRE

The following officers were elected *President*, George A Moulton Peterborough, *Vice-Presidents*, Lawrence E Cate, Rochester, and Frank J Kelly, Concord, *Secretary*, Rodney A Griffin, Franklin, *Treasurer*, A E Gosselin, Manchester, *Auditor*, Herbert E Rice, Nashua

NORTH DAKOTA

The following were elected at the Golden Anniversary meeting of North Dakota Pharmaceutical Association *President*, H Saunders, Minot Mr Saunders succeeds Lloyd G Beardsley of New Rockford, who becomes a member of the executive committee Other officers are *First Vice-President*, Andrew E Erickson Fargo, *Second Vice-President*, Philip Boise, Dickinson, W F Sudro, Fargo was reelected *Secretary*, and P H Costello, Cooperstown reelected *Treasurer*

The history of the association from its incorporation December 15, 1886, under Dakota territory laws to the present time was traced by W P Porterfield of Fargo at the dinner meeting of the Veteran's association

VERMONT

Officers of Vermont Pharmaceutical Association elected for the ensuing year are *President*, George T Donovan, Fair Haven, *Vice-Presidents*, Joseph W Blakely, Montpelier, F W Wheeler Springfield, Albert E Cox, Hardwick, *Secretary* and *Treasurer*, L C Chukering, Brattleboro

WISCONSIN

Wisconsin Pharmaceutical Association elected the following officers *President* John L Huber, Racine, *Vice-Presidents*, Arthur Broenen South Milwaukee, Carl Hendricks, Superior, M C Whitrock Wisconsin Rapids, *Secretary*, Jennings Murphy, South Milwaukee, *Treasurer*, Bruno F Liedel, Milwaukee S H Dretzla, retiring president, was elected *Delegate* to the A Ph A meeting

Speaking on the work of the Interprofessional Relationship Committee Ralph W Clark suggested that dentists be added to the list of professional men getting prescription suggestions from the druggists

LOUISIANA PHARMACY BUILDING

Louisiana State University has applied to the Public Works Administration for a grant of \$1,035,000 00 toward construction of a new 14-

story pharmacy and medical building. The cost of the entire project was fixed at \$2,292,-456 00. The application was made by Dr James M Smith, president of the University, as part of the extension to the medical center to provide housing and facilities for schools of pharmacy, dentistry and graduate school of medicine, and additional facilities for the present school of medicine.

(To be continued)

BRITISH PHARMACEUTICAL CONFERENCE

LIST OF SCIENCE PAPERS

The following papers have been received for communication to the Belfast meeting of the British Pharmaceutical Conference, and will be read at the Science Sessions, June 25th and 26th: "Thyroid Standardization and Dosage," R F Corran, J Pritchard and F E Rymill.

"The Effects of Hot Solvents on Ergot, with a Note on the Effects of Storage on the Activity of Ergot," R F Corran and F E Rymill. "The Estimation of the Mercury Content of Mercurochrome," R F Corran and F E Rymill.

"The Determination of Ferrous Iron in Presence of Organic Matter by Heisig's Method," G J W Ferrey.

"Observations on the Preparation and Properties of Iodoform and Thymol Iodide," Norman Glass.

"The Preparation of Sterile Solution—II," H Davis.

"The Assay of Glyceryl Trimtrate Tablets," Wilfred Smith. "Glyceryl Trimtrate Tablets," H O Meek. "Percolation of Cinchona and Belladonna, the Rate of Alkaloid Extraction and Effect of Degree of Commuution," A W Bull.

"A Note on Isopropyl Nitrite," C L M Brown.

"The Glycols (with special reference to Propylene Glycol)," C L M Brown.

"The Melting Point of Chloral Formamide," C T Bennett and N R Campbell.

"Alcohol Content and Specific Gravities of Tinctures of the British Pharmaceutical Codex," 1934, C T Bennett and F C L Bateman.

"The Use of Rabbits in the Assay of Digitalis, Strophanthus and Squill," G N Rapson and S W F Underhill.

"The Oestrogenic Activity of the Urine of Cows during Pregnancy," M M O Barrie J B E Patterson and S W F Underhill.

"The Deterioration of Atropine Eye Ointments on Storage," Noel L Allport, A I C.

"An Improved Method for the Estimation of the Essential Oil Content of Drugs," T Tusting Cocking and G Middleton.

"The Relative Merits of Maceration and Percolation for the Preparation of Tincture of Digitalis," H Berry and H Davis.

"A Note on the Spectrographic Absorption of Ergometrine in Relation to the Maurice Smith Colour Test," Noel L Allport and S K Crews.

"The Determination of Lead in Its Official Compounds and Preparations," S Wetherell.

"The Stability of Aqueous Solution of Ouabain and K Strophanthus," H Berry.

"The Analysis of Some Complex B P C Ointments," D C Garratt. "Estimation of the Extractives of Capsicum," H Berry.

THE MEDICAL ASSOCIATION MEETING AT ATLANTIC CITY

Liberty is taken in quoting from *Merc's Report* on the program of the Scientific Assembly of the American Medical Association. Looming large are the possibilities of vitamin and endocrine therapy, forecasting possible revolutionary changes in the treatment of many diseases. Studies on Crystalline Vitamin B₁, Experimental and Clinical Observations by Drs Martin G Vorhaus, Robert R Williams and Robert E Waterman, New York, was a paper representative in the vitamin field. Among those enlisting interest in the field of endocrinology were the papers on The Antihormone Theory in Relation to Anterior Pituitary Physiology by Dr James B Collip, Montreal, Que., "Recent Advances in Knowledge of the Relationship of the Pituitary to Ovarian Hormones" by Dr David P Barr, St Louis, "Thyroxine and the Hormone Elaborated by the Adrenal Cortex" by Dr E C Kendall, Rochester, Minn. "Experimental Studies on Replacement Therapy in Adrenal Insufficiency," by Drs Arthur Grollman and W M Firor, Baltimore, "Comparative Effects of Pressor and Oxytocic Fractions of Posterior Pituitary Extract on Blood Pressure and Intestinal Activity" by Dr Kenneth I Melville, Montreal, Que. The Biologic Effects following the Continuous Administration of Pineal Extract to Successive Genera-

tions," by Drs Leonard G Rowntree and J H Clark, Philadelphia, and A M Hanson, Faribault, Minn, and 'The Pharmacology of Testicular Hormones," by Dr D Roy McCullagh, Cleveland This last paper is of interest in that the possible treatment of prostatic hypertrophy appears to be foreshadowed, following the suspicion of the author of the presence of a second testicular hormone called 'Inhibin"

The paper by Fred E Angle, entitled Treatment of Acute and Chronic Brucellosis (Undulant Fever)" emphasizes the specificity of undulant fever vaccine therapy, with special reference to its preparation, the selection of strains, dosage, method of administration, reactions and contraindications for its use

The Scientific Exhibit was outstanding Here again vitamins and endocrinology played an important role Drs Irving S Wright A W Duryee and co workers also showed the spectacular results obtained in their first nine cases of chronic leg ulcer treated with Mecholyl iontophoresis All of these cases were of long duration, had failed to heal with other therapy, and were discharged as cured with complete healing The National Formulary Exhibit was reported on in the June issue of the JOURNAL A PH A, page 520

VIRGINIA PHARMACEUTICAL ASSOCIATION

The 54th annual convention of the Virginia Pharmaceutical Association was held at Virginia Beach, June 17th to 19th The measure which received most attention was a Fair Trade Bill similar to the California Law The Association went on record disapproving the requesting of medicine from manufacturers for distribution at District meetings

A resolution was adopted to amend the existing pharmacy law The business must be operated under the direct supervision of a registered pharmacist and an assistant pharmacist may temporarily act in his place

ILLINOIS PASSES FAIR TRADE ACT

The Illinois House passed without opposition the Fair Trade Act approved a few days earlier by the Senate It is expected that the bill will be signed promptly by Governor Horner

DELAWARE

Delaware Pharmaceutical Association decided that, in the event that no similar federal legislation be enacted by Congress before 1937, the Society will fight for the enactment of a

Delaware fair trade law at the 1937 session of the State Legislature Dr Robert L Swain of Baltimore, described the operation of the Maryland fair trade law Among other speakers were Thomas S Smith, Wilmington, Walter L Morgan, Wilmington, James W Wise Dover, and Albert Williams, Laurel The election of officers resulted as follows *President*, George W Brittingham, Wilmington, *Vice Presidents*, E J Elliott, Bridgeville Frank Brereton, Milford, Paul Potocki Wilmington *Secretary*, Albert Bunin Wilmington *Treasurer*, Albert Dougherty Wilmington The new board of directors consists of Thomas S Smith, Walter L Morgan and Paul Potocki, Wilmington, and Harry P Jones, Smyrna

PRESCRIPTIONS IN 1885

The *Pharmaceutical Record* in 1885, published a paper by G W Sloan former President of the AMERICAN PHARMACEUTICAL ASSOCIATION read before the Indiana Pharmaceutical Association giving an analysis of 1000 prescriptions dispensed in a store, where the formulas of a great number of physicians are dispensed Twelve leading medicines were counted and it was also ascertained in what proportion proprietary articles were ordered The following is a summary of the results Arsenic 41 bismuth 59, bromine 59 chloral 16, ergot 15 iron 128 iodine 60, mercury 60 nux vomica 130 opium 136 pepsin 42 quinine 238 Proprietary articles appear 68 times—*The Chemist and Druggist*, June 22 1935

H R 8442 and S-3154

Congressman Wright Patman and Senator Arthur R Robinson have introduced similar bills, numbered as above, which have been referred to the Committee on Judiciary in both branches of Congress The bill makes it unlawful for any person engaged in commerce to discriminate in price or terms of sale between purchasers of commodities of like grade and quality, to prohibit the payment of brokerage or commission under certain conditions, to suppress pseudo advertising allowances to provide a presumptive measure of damages in certain cases and to protect the independent merchant, the public whom he serves and the manufacturer from whom he buys, from exploitation by unfair competitors

The bill seems to have the embodiment of a measure which will give protection to the small dealer by the establishment of fair dealing

J K Lilly, *Honorary President* of the American Pharmaceutical Association and chairman of the board of directors of Eli Lilly & Co., Indianapolis, was recently married to Mrs Lila Allison Humes

We are just advised of the death of W F Michel, editor of *The Optimist*

Governor Hoffman has appointed President

Robert P Fischelis of the AMERICAN PHARMACEUTICAL ASSOCIATION, who is Chairman of the Conference on Allied Medical Professions of the State of New Jersey, comprising the profession of Medicine, Pharmacy, Dentistry and Nursing, a member of the Committee to study the problems of unemployment insurance and of old age relief, etc

NOTICE TO CONTRIBUTORS TO THE JOURNAL AMERICAN PHARMACEUTICAL ASSOCIATION

The following notice has been prepared from comments received from members of the Board of Review of Papers and of the Publication Committee

Manuscripts should be sent to Editor E G Cberle, 2215 Constitution Ave., N W, Washington, D C

All manuscripts should be typewritten in double spacing on one side of paper 8½ x 11 inches, and should be mailed in a flat package—not rolled The original (*not* carbon) copy should be sent The original drawings, not photographs of drawings should accompany the manuscript Authors should indicate on the manuscript the approximate position of text figures All drawings should be marked with the author's name and address

A condensed title running page headline, not to exceed thirty five letters, should be given on a separate sheet and placed at the beginning of each article

The method of stating the laboratory in which the work is done should be uniform and placed as a footnote at end of first page, giving Department, School or College The date when received for publication should be given

Numerals are used for figures for all definite weights, measurements, percentages, and degrees of temperature (for example 2 Kg, 1 inch, 20 cc, 300° C) Spell out all indefinite and approximate periods of time and other numerals which are used in a general manner (for example one hundred years ago, about two and one half hours, seven times)

Standard abbreviations should be used whenever weights and measures are given in the metric system, *e g*, 10 Kg, 2.25 cc, etc The forms to be used are cc, Kg, mg, mm, L and M

Figures should be numbered from 1 up, beginning with the text figures (line engravings are always treated as text-figures and should be designated as such) and continuing through the plates The reduction desired should be clearly indicated on the margin of the drawing All drawings should be made with India ink preferably on white tracing paper or cloth If coordinate paper is used, a blue-lined paper must be chosen Usually it is desirable to ink in the large squares so that the curves can be more easily read Lettering should be plain and large enough to reproduce well when the drawing is reduced to the width of a printed page (usually about 4 inches) Photographs intended for half tone reproduction should be securely mounted with colorless paste

"Figure" should be spelled out at the beginning of a sentence, elsewhere it is abbreviated to "Fig," per cent—2 words

The expense for a limited number of figures and plates will be borne by the JOURNAL, expense for cuts in excess of this number must be defrayed by the author

References to the literature cited should be grouped at the end of the manuscript under the *References* The citations should be numbered consecutively in the order of their appearance (their location in the text should be indicated by full sized figures included in parentheses) The sequence followed in the citations should be Author's name (with initials) name of publication volume number, page number and the date in parentheses Abbreviations for journals should conform to the style of *Chemical Abstracts*, published by the American Chemical Society

(1) Author, A Y, *Am J Physiol*, 79, 289 (1927)

Papers presented at the Sections of the AMERICAN PHARMACEUTICAL ASSOCIATION's annual meeting become the property of the ASSOCIATION and may at the discretion of the Editor be published in the JOURNAL Papers presented at these Sections may be published in other periodicals only after the release of the papers by the Board of Review of Papers of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

The Editor will appreciate comments from Board of Review and Committee on Publication members, authors and others interested

LUDWIG WINKLER

Ludwig Winkler, president of the Society for the History of Pharmacy since its organization, died at his home near Innsbruck July 8, 1935, aged 62 years. He was born January 12, 1873, descendent of the Apotheker family, dating pharmaceutical ancestry for more than 350 years and of the Apotheke in Innsbruck. Herein are furnishings of the 18th century and many of the old prescriptions of the pharmacy were modernized by the deceased. When Austria, in 1923, made history of pharmacy a requirement of the course Ludwig Winkler was named for the subject at the University of Innsbruck and at Innsbruck the Society for the History of Pharmacy was founded in 1926. In this work as well as in other research Dr. Winkler devoted studies, time, labor, and liberally of his means. He contributed largely to the Library of the University of Berlin, to this institution he gave photostat copies of the original manuscripts of Haydn's Opera 'Der Apotheker,'¹ no effort was too great whenever it was possible for him to aid in the study of pharmaceutical history and this applies particularly to his contributions to the Society for the History of Pharmacy.

LUDWIG WINKLER

Dr. Alexander Tschurch in a greeting on the sixtieth birthday of Ludwig Winkler said that pharmacy would ever be grateful for the work in connection with the Society. Seldom has a thought taken root with such rich results. In this connection as a memorial to the pharmacist and historian Ludwig's memory should be commemorated in the American Institute of Pharmacy. His home university created him an honor citizen and he received the gold honor ring of the German Museum at Munich.

On account of health conditions he did not attend the later meetings of the Society, the Apotheke which he had conducted with honor to himself, his antecedents and pharmacy was passed into the hands of his oldest son in 1933.

The *Pharmazeutische Zeitung* closes a sketch with words expressive of that "what Ludwig Winkler received from his ancestors he deepened, clarified and enriched for those who follow. A worker died, his works live on." Quoting the original—"*Was er von den Ahnen empfing, hat er vertieft, geklärt und bereichert an die Nachwelt weitergegeben. Ein Wirkender starb, das Werk bleibt lebendig.*"

¹ "Der Apotheker" was produced in 1768. "The Doctor and the Apothecary" was written in 1762 by Haydn's friend, Dittersdorf, who gave the former violin lessons. Some of Haydn's works were burned when Prince Esterhazy's private theater was destroyed by fire in 1779.

H A ESTABROOK

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL XXIV

AUGUST, 1935

No 8

HENRY A ESTABROOK

Henry Arthur Estabrook is concluding his 50th year of membership in the AMERICAN PHARMACEUTICAL ASSOCIATION. He was born in Ashby, Mass., April 22, 1850, and the 85th anniversary of his birth was made the occasion of a celebration by the members of the Massachusetts House of Representatives of which he has been a member for 12 years. Addresses and presentations were made and the veteran responded in a happy vein. He is House Chairman of the committee on education.

The subject of this brief sketch comes of Revolutionary stock—his father was a direct descendant of Rev. Joseph Estabrook, known in prerevolutionary times as the sage of Concord, his mother was a direct descendant of James Hayward, one of the three Colonials killed at Concord by "the shots heard around the world."

Mr. Estabrook came to Fitchburg from Salem in 1881 and purchased the Derby drug store and continued in the business until 1921 when it was incorporated under the name of Estabrook-Green Co., Inc., of which he was president until he joined the pharmaceutical staff of Brooks Pharmacy, Inc.; later, he established a surgical appliance business.

Mr. Estabrook was a member of the first state board of pharmacy of Massachusetts and he is an honorary member of the New England Board of Registration. He has been a trustee and director of Massachusetts College of Pharmacy for many years and has been honored by that institution with a pharmacy degree, and he has always taken a deep interest in local and state pharmaceutical associations.

Our veteran member takes an active part in church and civic affairs, for several years he was parish clerk and treasurer, and director of the Y M C A, Fitchburg, and holds membership in Masonic and other fraternal organizations. He was a member of the School Committee of the city for many years, a director of the Merchants Association and the Board of Trade, a trustee of the Worcester North Savings Institution, of the Fitchburg Rifle and Gun Club, Massachusetts Fish and Game Protective Association, of which he was elected an honorary life member.

THE PORTLAND MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

THE 83rd annual meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION has become part of its history. The attendance was larger than anticipated by those who had given consideration to the prospects, fearful that distance from more central points would prevent many from going to the convention this year. The hosts were enthusiastic in their appreciation of the selection for the 1935 meeting expressed by a very interesting and enjoyable program. The hospitalities of Oregon and sister states made the visitors aware of the genuineness and sincerity of the welcome accorded them.

The Local Secretary and the co-workers entered early into the determination to make a success of the Portland meeting and the spirit resulted in arrangements which marked the annual event and the convention programs. There was evident a leadership and a desire that the workers of the ASSOCIATION and the related organizations should realize that the hosts had service as an outstanding purpose and were delighted to entertain the visitors. In this they eminently succeeded and only words of praise were heard, the press published excellent reports of the meeting and the hotel made the visitors feel at home, the meeting rooms were all on one floor, so that members had no difficulty in locating the sessions and, when necessary, to expeditiously render their reports at the meetings of the several sections and conferences.

The Tri-State meeting of the Associations of Oregon, Washington and Idaho held on Monday and Tuesday was an unusual feature and added greatly to the attendance and interest. This joint meeting brought the pharmacists of the Pacific Northwest into closer touch with the A P H A and set a precedent which might well be followed in many sections.

At this late day it is impossible to detail the transactions, and members are referred to the addresses of presiding officers, sessions of the Council and report of the Committee on Resolutions, which, it is hoped, can be included in this number of the JOURNAL. The addresses speak for the activities of the respective bodies and the reports of part of the transactions. The conclusions reached on some of the important matters and other details will have to be deferred to succeeding issues, when the minutes of the General Sessions, House of Delegates, Sections of the ASSOCIATION and related bodies are printed. A general statement will apply that this meeting was eminently successful, and there was evident a desire to coordinate and cooperate to the end that pharmacy may progress, and that those engaged may look to leadership and direction from the associations charged with duties to improve conditions by sane and fair methods of business and professional conduct. Progressive steps have been taken and it may be said that the meetings of the state associations were mutually helpful, the outcome of some of these discussions will find further expression by national and state associations.

The award of the Ebert Prize to Marvin J. Andrews shows that the careful studies in prescription practice have awakened thought relative to the great im-

portance of this service The founder of the Prize, Albert E Ebert, was a practicing pharmacist during his life

Certificates of appreciation were awarded to Chairman H C Christensen of the Committee on Pharmacy Exhibit at the Chicago Century of Progress and to his co-workers in this splendid effort to emphasize to the people the public-health service of pharmacy

The report of the Special Committee on the Council on Pharmaceutical Practice presented in the General Sessions and the discussion of Prescription Department Economics, bearing on the revision of Professional Pharmacy, the Symposium on Prescription Pricing, the address on "The Practical Value to Pharmacists of the Activities of the Council on Pharmacy and Chemistry, and the Address on Dentistry and Pharmacy," bear evidence of the absorbing thoughts to advance pharmacy and coordinate public health professions

The address of President Fischelis presented the deep interest of the ASSOCIATION in supplying proper standards, a purpose which led to the establishment of the ASSOCIATION The United States Pharmacopœia and the Federal Food and Drugs Act was the subject of a thoughtful address by James H Beal as part of the program of a General Session

The Report of the Committee on Maintenance speaks for the untiring and successful efforts of Chairman H A B Dunning which have been largely instrumental in providing for American pharmacy a building in which pharmacists may well have pride and hope for it a growing usefulness His work, with the support of every division of pharmacy, has brought distinction and further possibilities to pharmacy

Dr D M R Culbreth, Baltimore, member since 1883, was elected honorary president and Dr C A Rojahn, Halle, Germany, editor of the German Year Book of Pharmacy, was elected an honorary member of the ASSOCIATION

The House of Delegates held representative sessions, the reports showed the cooperative value afforded by and for the constituents, the activities are in the interest affecting all divisions of pharmacy as shown by its program The sections considered many papers in line with present-day thought The revisions of the United States Pharmacopœia, the National Formulary and the Recipe Book marked quite a number of the contributions to the Scientific Section, the Section on Practical Pharmacy and Dispensing and the Section on Education and Legislation

The Section on Historical Pharmacy considered many interesting papers—a number dealt with Indian materia medica, a valuable report concerned the Badianus Manuscript, an Aztec herbal, being the earliest known herbal published in the New World It was written in Aztec by one Indian and translated into Latin by another in 1552, both were educated in a college in Mexico City Of general interest, the paper on "Pharmacy and a Commemorative Stamp" was presented by F A Delgado, and illustrated by slides—The proposal is to have the Post Office Department provide a stamp commemorating the completion of the American Institute of Pharmacy

The Conference of Pharmaceutical Association Secretaries and the Conference of Pharmaceutical Law Enforcement Officials held sessions in which the subjects of their respective activities were considered The American Association of Colleges of Pharmacy, National Association of Boards of Pharmacy and the National Con-

ference on Pharmaceutical Research held sessions in line with the programs printed in the July JOURNAL and these with the addresses of the presidents of the former will have to suffice for this comment. The Plant Science Seminar made tours of inspection to the Estacada Ginseng and Hydrastis projects, the Peavy Arboretum, Oregon State College, and convened in Portland for the consideration of papers.

Outstanding among the entertainment features was the trip along famous Columbia River Highway, with a visit to Bonneville \$32,000,000.00 dam and a Columbia River salmon barbecue luncheon at Eagle Creek. The annual banquet was presided over by F. C. Felter, at which time Dr. Tate Mason, president-elect of the American Medical Association, was introduced and addressed the guests, he was followed by Dr. Herbert C. Miller, president of the North Pacific College of Dentistry and a trustee of the American Dental Association. Mayor Carson welcomed the visitors and Hon. Dan J. Fry spoke for the Governor. The principal address was made by President R. P. Fischelis, officers and visiting pharmacists were introduced. Frank Nau received from his fellows a plaque in recognition of his services to the profession in the North Pacific section. An interesting feature was the conferring in full form the honor of Rosarians on the following: R. P. Fischelis, knighted with Lady Fairfax Rose, E. F. Kelly, Lady Hillingdon, Ernest Little, Roselandia, Harvey A. Henry, Marcia Stanhope, Dr. Tate Mason, President-Elect of A. M. A., Mary Hart, Charles H. Evans, Dean Hole Rose.

The following former presidents and members of their families attended the annual past-presidents' dinner: James H. Beal, E. G. Eberle, Wm. B. Day, S. L. Hilton, H. V. Army, L. L. Walton, T. J. Bradley, C. W. Johnson, H. C. Christensen, W. D. Adams, Robert L. Swain. The attendance at the annual event indicates the continued interest of these members and speaks for their loyalty and appreciation of the honor conferred by the ASSOCIATION.

Nowhere can flowers be more beautiful and abundant, the artistic landscaping brought the colors into Nature's design. The scenery was awe-inspiring, magnificent, grand and beyond comparison—a panorama of wonders in which the hospitalities of the hosts were blended.

THE EIGHTY-FOURTH ANNUAL MEETING OF THE A. P. H. A.

THE 84th annual meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION will be held in Dallas, Texas, it so happens that the selection brings the ASSOCIATION to Texas during the celebration of the centenary of its independence and the establishment of the Republic of Texas. Celebrations will be held in a number of cities where events in the history of Texas took place, a fact which assures low rates to these points as well as to Dallas. The latter city has entertained many large organizations because of its hotel accommodations, automobile and railroad connections, it is 185 miles northeast of Austin, the State capital, and the home of the State University. The Medical and Dental Departments of Baylor University are located in Dallas. Among other educational institutions it is the seat of the Southern Methodist University, which has a campus of 625 acres and a \$2,000,000.00 endowment.

Mexico and Texas are bound together by economic interests and the boundary is practically as unfortified as that between Canada and the United States. The completion of the Mexican highway link with the opening of Texas Centennial brings Mexico into close proximity with the eighty-fourth annual meeting place.

SULPHIDE ANALOGUES OF AZO DYES HAVING BACTERICIDAL PROPERTIES *

BY W BRAKER AND W G CHRISTIANSEN ¹

The bactericidal properties of a number of diaryl sulphides have been reported by Hilbert and Johnson (1) and by Moness, Braker and Christiansen (2) Since this activity is ascribed to the presence of the sulphide linkage, we have investigated the combination of this grouping with other active groups present in certain azo dyes known to be therapeutically valuable

The compounds chosen for preparation contain the diaryl sulphide linkage combined with

- (1) The *p*-ethoxy benzene-azo residue of serenium (I),
- (2) The diamino pyridine grouping of pyridium (II)

Of the first type we prepared one example 3-*p*-ethoxy benzene-azo, 4-hydroxy diphenyl sulphide (III) Of the second type two compounds were made 4,4'-bis-(α,α -diaminopyridine-azo) diphenyl sulphide (IV), and 3,5-bis(4'-amino diphenyl sulphide-azo) 2,6-diamino pyridine (V)

(I)

(II)

(III)

(IV)

(V)

* Scientific Section A PH A Washington meeting 1934

¹ Research Department of the Chemical and Pharmaceutical Laboratories, E R Squibb and Sons Brooklyn N Y

These compounds were readily prepared, but were found to be only slightly soluble in any of the media in which they might be used. Compound III could not be dissolved in mixtures of alcohol, water and glycerin or in water containing an equivalent of NaOH. IV and V were practically insoluble in water containing an equivalent of HCl. They were, however, tested for antiseptic activity by means of the "cup test." In this attempt at evaluation, the powdered compounds were placed in depressions in the center of an inoculated (*Staphylococcus aureus*) area of nutrient agar, and the area of inhibition measured after 48 hours (3). Serenium and pyridium, used as controls, showed clear zones of 4-5 mm. III and IV, under these conditions, were quite inactive, and V was only slightly active.

EXPERIMENTAL

Preparation of 4,4' Diamino Diphenyl Sulphide—The method of Merz and Weith (4) was used, yielding yellowish white needles m p 104-108° C. The authors state 108° C as the m p.

Preparation of 2,6-Diamino Pyridine—The method of Tchitchibabin (5) yielded this substance in the form of silvery leaflets, m p 119° C, stated in the literature to be 119-120° C.

Preparation of p Hydroxy Diphenyl Sulphide—The preparation of this compound is described in a previous paper (1).

Preparation of 3 p Ethoxy Benzene Azo, 4 Hydroxy Diphenyl Sulphide—1.3 Gm p phenetidine was dissolved in a mixture of 21.5 cc of N-hydrochloric acid and 25 cc of water. The substance was diazotized at 0° C with a solution of 0.69 Gm NaNO₂ in 10 cc water. 2.02 Gm p-hydroxy diphenyl sulphide dissolved in 25 cc 2N NaOH was added with vigorous stirring. The reaction mixture was allowed to stand at 0° C for 2 hours then at 30° C for 4 hours longer. The red dye which had separated out was then filtered off, washed with water and dried *in vacuo*.

Yield—1.54 Gm of a red powder

Analysis Found—S, 9.40%, calculated for C₁₆H₁₄O₂N₂S—S, 9.14%

Preparation of 4,4'-Bis (α,α Diamino Pyridine Azo) Diphenyl Sulphide—4.2 Gm 4,4' diamino diphenyl sulphide was dissolved in a mixture of 20 cc conc hydrochloric acid and 50 cc water. Diazotization was carried out at 0° C with a solution of 2.7 Gm NaNO₂ in 20 cc water. 4.4 Gm of 2,6 diamino pyridine dissolved in dilute hydrochloric acid (one equivalent of HCl) was then vigorously stirred in. A red precipitate began to separate. After standing at 0° C for one hour, then at 30° C for 3 hours, the mixture was made ammoniacal. The precipitate was filtered off, washed with water and dried *in vacuo*.

Yield—8.2 Gm of an orange-colored powder

Analysis Found—S, 6.80%, calculated for C₂₂H₁₆N₆S₂—S, 7.02%

Preparation of 3,5 Bis (4' Amino Diphenyl Sulphide-Azo) 2,6-Diamino Pyridine—5.0 Gm 4,4' diamino diphenyl sulphide in 3 equivalents of dilute hydrochloric acid was diazotized at 0° C with a solution of 1.53 Gm NaNO₂ in 20 cc water. A slight residue, present after diazotization, was removed by filtration. To the clear filtrate was added with vigorous stirring, and at 0° C, 1.17 Gm 2,6-diamino pyridine dissolved in dilute hydrochloric acid. Immediate precipitation occurred. After standing at 30° C for 4 hours, the reaction mixture was made alkaline. The precipitate was filtered off, washed with water, sucked dry, washed with several portions of warm benzene and dried *in vacuo*.

Yield—4.5 Gm of a red powder

Analysis Found—S, 11.29%, calculated for C₂₂H₁₆N₆S₂—S, 11.37%

The biological tests on the compounds here reported were made in the Biological Research Laboratories of E. R. Squibb and Sons and we gratefully acknowledge their assistance.

SUMMARY

1 Three new dyes, containing the diaryl sulphide linkage, together with residues present in serenum and pyridium, have been prepared

2 These substances have been tested for antiseptic activity and have been found to be inactive

PHYTOCHEMICAL NOTES *1

No 108 A PHYTOCHEMICAL STUDY OF THE SEED OF THE DIGGER PINE

BY JOSEPH SEMB

In the early part of November 1931, forty pounds of Digger pine seed were received from Mr J W Preston, Chico, Calif One hundred of these seeds were cracked and separated into seed coats and endosperms The former weighed 53.20 Gm (= 76.9 per cent), the latter 15.95 Gm (= 23.1 per cent) Inasmuch as the 100 seeds weighed 69.15 Gm, the average weight of the individual seed is a trifle less than 0.7 Gm That of the endosperm is about 0.16 Gm

Samples of ground seed, of seed coats and of endosperm were extracted with selective solvents The data are recorded below

PERCENTAGE EXTRACTED

Solvent	From Seed Per Cent	From Seed Coat		From Endosperm	
		A (2) Per Cent	B (3) Per Cent	C (4) Per Cent	D (5) Per Cent
Pet ether	11.47 (1)	0.18	0.13	53.00	12.20
Ethyl ether	0.27	0.30	0.23	1.00	0.23
Chloroform	0.11	0.00	0.00	0.74	0.17
Alcohol	0.90	0.76	0.59	2.90	0.66
Water	1.98	2.00	1.44	8.20	1.89
1% HCl	15.00	18.20	14.00	27.18	6.26
1% NaOH	2.60	5.00	3.70		

Of the 40 pounds of seed, 37.5 pounds or 17 Kg were ground in the horizontal disk mill The coarsely comminuted material was extracted in the cold with petroleum ether for 24 hours After the percolate had been drawn off, the dregs were reground in a ball mill This reground residue was subsequently extracted twice with petroleum ether in the cold A test sample of the last extraction indicated that the extraction was almost complete Most of the petroleum ether was recovered The last traces were removed by heating on a water bath under somewhat reduced pressure for several hours During part of this time a current of CO₂ was passed through the liquid to assist in the complete removal of the volatile solvent The petroleum ether extract thus obtained weighed 1950 Gm = 11.47% of the seed or 49.66% of the endosperm

* Scientific Section, A Ph A, Miami meeting, 1931

¹ From the laboratory of Edward Kremers

After having been exhausted with petroleum ether, the ground seeds were percolated with alcohol. The last application of menstruum extracted about 0.15 per cent of the total seed. The recovery of the alcohol yielded a dark brown extract. 100 Gm of drugs, in four separate experiments were extracted with the following hot solvents yielding the amounts of extract recorded.

1	Chloroform	0.04 Per cent
2	Ethyl alc	1.13 Per cent
3	Methyl alc	1.06 Per cent
4	Acetone	0.28 Per cent

As a result of the extractions described the following products were obtained

- (1) A petroleum ether extract, consisting principally of fatty oil
- (2) A concentrate of the cold alcoholic percolate

(1) *The Petroleum Ether Extract (Fatty Oil)*—This product was almost colorless and odorless and had a bland taste. $d_{18}^{\circ} = 0.9177$ and $d_4^{\circ} = 0.9167$, $n_{D,18} = 1.4713$ (Abbé), $[\alpha]_D = -0.30^{\circ}$. It solidified at about -15° .

The oil was perfectly neutral. Three saponification determinations gave 189.9, 190.4 and 189.0, respectively, or an average of 189.8. Its iodine value (Hanus) was found to be 120, its acetyl value 4.9 and 5.0. Its thiocyanogen value 83.1, 83.5, 82.3 or an average of 83.0 (6). From these three values, viz., saponification, iodine and thiocyanogen, the following percentages were calculated: 4.3% of saturated fatty acids, 50.5% of oleic acid, and 45.2% of linolic acid. When one cc was exposed to the air on a watch glass an increase in weight of 0.7% was observed after two weeks.

Ninety-seven grams of this oil were oxidized in acetone solution by means of potassium permanganate (7). Four separate fractions were obtained. The fatty acid obtained from the first fraction had a b.p. of 202° , $n_{D,20} = 1.4146$, and a mean molecular weight of 115.1 (calculated from acid value), thus indicating hexoic acid. The second fraction yielded an acid with a b.p. of 246.2° and a molecular weight of 148.7 (from acid value). This indicates nonoic acid probably contaminated with hexoic acid. The third fraction yielded an acid which was insoluble in petroleum ether but somewhat soluble in hot water. It had a m.p. of 106° and a molecular weight of 188.2 (from acid value assuming a dicarboxylic acid). This indicated azelaic acid. The fourth fraction consisted of 16 and 18 carbon atom fatty acids.

These data indicate that the first double bond in every case is at the 9-10 position, also that this or a second double bond is in the 6-7 or 9-10 position from the end. Had malonic acid been isolated, these data would indicate that only two unsaturated fatty acids are present, that is, the 9-10 oleic and the 9-10, 12-13 linoleic acid. Undoubtedly malonic acid was formed but was lost in the process of purification and isolation.

1625 cc of the fatty oil were saponified by refluxing with alcoholic KOH. The alcohol was removed by vacuum distillation. About 14 liters of water were added to the potassium soap. The non-saponifiable material was extracted with ethyl ether. Troublesome emulsions were encountered, but the addition of small amounts of methyl alcohol was very effective in breaking these emulsions. Most of the ethyl ether was recovered from the unsaponifiable and the latter was turned over to Dr. Bonstedt.

Dilute sulphuric acid was now added to the soap solution, and immediately a fatty acid ethereal layer (about 3 l) separated out (This shows that the soap held a considerable quantity of ethyl ether in solution) The aqueous layer containing the glycerin was drawn off and shaken twice with ether The three ethereal portions were united and washed several times with water The ether and occluded water were removed by heating under vacuum for $2\frac{1}{2}$ hours The total weight of fatty acid was 1390 Gm Iodine value 124.2, thiocyanogen value 85.0, acid value 198.1, molecular weight 283.1 (computed from the acid value) Using these three values, the following percentages were calculated saturated fatty acids 5.5%, oleic acid 51.0%, linoleic acid 43.5%

1223 grams of this fatty acid were dissolved in 7200 cc of alcohol This solution was then heated on the water-bath and to it were added 7200 cc of alcoholic lead acetate, containing 900 Gm of the salt (8) The mixture was exposed over night to a temperature of about 6° The next morning the supernatant liquor was drawn off and the mushy, sticky lead soap adhering to the side of the flask was redissolved in 7200 cc of hot alcohol which contained a little acetic acid Again the solution was set outside over night to permit the solid lead soap to settle out, and again the supernatant liquid was drawn off and the solid lead soap redissolved in hot alcohol, the alcoholic solution allowed to cool and filtered All the alcoholic solutions were mixed The mixed solutions are supposed to contain the lead soap of the liquid fatty acids The insoluble lead soap obtained was covered with 400 cc of ethyl ether After several days the ethereal solution was drawn off As will be seen later, the fatty acid recovered from the ethereal solution was added to the free fatty acids from the ether insoluble lead soap

The Solid Fatty Acids—The insoluble lead soap was decomposed with dilute HNO_3 and the freed fatty acids extracted with ethyl ether The ether was removed leaving a solid residue weighing 140 Gm with a melting point of 31° The attempt to separate the solid fatty acids by fractional crystallization was without success Likewise fractional precipitation as magnesium salts was unsatisfactory The odds and ends were gathered and found to weigh about 100 Gm To this was added the fatty acid obtained from the ethereal solution that had stood over the alcoholic insoluble lead soap The methyl esters of this mixture of supposedly saturated acids were made and distilled under 5 mm pressure

No	B P $^{\circ}$ C	Wt.	M P $^{\circ}$ C	Iodine No	Saponification Value
1	-160	9.8	17		
2	166-170	16.3	18.5	53.3	203.9
3	170-174	26.9	15.5

7	182	15.7	15.0	77.8	
8	Residue	12.1			
		173.0			

The high iodine values may be attributed to imperfect separations It is well known that none of the methods are any too satisfactory The methyl ester fraction No. 3 was saponified and the freed fatty acid treated with lead acetate as stated above except that this solution was allowed to cool to only 18° , not to 6° The insoluble lead soap thus obtained was firm and not mushy as in the original separation The free fatty acid from this insoluble lead soap had a m p of 56° , an iodine value of 5.8, and a mean molecular weight of 261.7 (from the acid value), indicating a predominance of palmitic acid The freed fatty acid from the alcoholic supernatant liquid gave iodine values of 109.8, 110.8 and 112.8 or an average of

1112 This indicates the ratio of oleic to linoleic acid to be about the same as that in the original oil (9)

Methyl esters Nos 1 and 2 were mixed and bromine added at -10° to the petroleum ether solution. The unbrominated saturated fatty esters were separated by reduced pressure distillation. A fatty acid with a m p of 63° and whose corresponding methyl esters melted at 28° was obtained. This indicates that palmitic acid is present. The large amounts of acids obtained at various times from the various fractions with a melting point around 56° and a mean molecular weight of about 262 indicates that the greater amount of the saturated fatty acid is palmitic acid.

From fractions Nos 6 and 7 a fatty acid was isolated, this time by means of the lead-acetate-alcohol method, with a m p of 65.5° . The methyl ester of this had a m p of 39° . The mean molecular weight was 290° (from acid value). The presence of stearic acid was verified by means of a method suggested by E. Twitchell (10). To 20 parts of the above acid, weighed on an analytical balance, 80 parts of Eastman's stearic acid, also weighed on an analytical balance, was added. The mixture was dissolved in ether and the ether evaporated. The addition of these 20 parts of above acid to 80 parts of Eastman's stearic acid depressed the m p of the Eastman stearic acid less than one degree. Therefore, the larger part is stearic acid.

The high molecular weight of the stearic acid fraction discussed above indicates that a saturated fatty acid higher up in the series than stearic is present. From the methyl ester fraction No 8 a solid fatty acid fraction melting higher than that recorded in the literature for stearic acid was obtained. The quantity was too small to be identified.

The Liquid Fatty Acids—The alcohol-soluble lead soap was decomposed with H_2S . The freed acids were brominated in acetic acid (11), and from the reaction mixture 208 Gm of tetrabromstearic acid were obtained. The melting point of this pure white substance, upon recrystallization from petroleum ether, was 114.0° and the molecular weight, computed from the acid value, was found to be 608.0. The bromine content, determined by the Stepanow method, was found to be 53.27 per cent. The reported melting point of tetrabromstearic acid is 114.0° , the computed molecular weight 600, and the bromine content 53.3 per cent.

The filtrate from the tetrabromstearic acid, which is supposed to contain only the dibromstearic acid was debrominated with zinc. Five grams of the recovered fatty acid were oxidized with dilute $KMnO_4$. About one Gm of a petroleum ether-soluble fatty substance with a m p of 37.0° was obtained. The petroleum ether-insoluble residue was dissolved in alcohol. Upon cooling, about one Gm of a white substance with a m p of 131.5° was obtained. Hilditch reports 9,10 dihydroxy stearic acid to melt at 132.0° .

The rest of the liquid acid was steam distilled in order to see if there were any volatile fatty acids present, but the results were negative. This would rule out the presence of any appreciable amount of 6-, 8- and 10 carbon atom acids and possibly a 12-carbon atom acid. According to Hilditch's (*Fats and Waxes*, 74 (1927)) these lower saturated acids might be expected with the unsaturated acids.

Next the methyl esters were made of this liquid acid portion and the esters fractionated under 7 to 8 mm pressure.

No	B P ° C	Iodine Value	Mol Wt from Acid Values		Saponification Value	
1	-186 (8 mm)					
2	186-188 (7 mm)	110 7	290 0		193 4	
		110 3	291 3	290 7	192 1	192 8
3	186-188 (7 mm)					
4	188-190 (7 mm)					
5	190	120 5	290 7		193 0	
			291 8	291 3	192 3	192 6
6	190 + residue					

The very small change in boiling point would seem to indicate a very constant boiling constituent. However, the very high iodine value in these esters is noteworthy. The iodine value of oleic acid is 90.0 and that of methyl oleate about 86.0. This would indicate that a great deal of the linoleic acid had not been removed as tetra bromide. This fact was established by isolating tetrabromostearic acid when the freed acid was brominated in petroleum ether solution.

- (1) This percentage is obtained from fat extracted from the main experiment
- (2) Computed with reference to the seed coat
- (3) Computed with reference to the entire seed
- (4) Computed with reference to the endosperm
- (5) Computed with reference to the entire seed
- (6) The method of Zeleny and Baily, *J I E C*, 24, 109 (1932), was used
- (7) Hilditch and Vidyarthi, *Royal Society A* 122, 552 (1929)
- (8) Hilditch, *Fat and Waxes*, 74 (1927), Twitchell, E, *J I E C*, 13, 806 (1921)
- (9) Consideration of this fact, that at 6° a great deal of oleic and linoleic acids, in a ratio approximating that in the original, comes down while at 18° very little separates should be worth recalling when this experiment is repeated. If an alcoholic solution of lead acetate is added to an alcoholic solution of fatty acids the following situation arises

In this particular case reaction "a" predominates and the opportunity of PbAc palmitate to react with another palmitic acid molecule to yield Pb(palmitate)₂ is remote compared with its opportunity to react with a molecule of linoleic acid to yield Pb palmitate linoleate, which undoubtedly is more soluble than Pb(palmitate) but less soluble than Pb(linoleate). The precipitate at 6° was probably a half-saturated and half unsaturated lead soap such as Pb palmitate-linoleate. At a higher temperature only the saturated lead soaps settle out.

THE LEAF OILS OF WASHINGTON CONIFERS VII JUNIPERUS OCCIDENTALIS *

BY E. V. LYNN AND LOUIS FISCHER ¹

Juniperus occidentalis Hook is a tree 20 to 40 feet or more in height. It grows on mountain slopes and high prairies of western Idaho, eastern Washington and Oregon and in the Cascade and Sierra Nevada mountains. Seldom is it found at elevations less than 6000 feet.

The leaves and branches for this work were collected in 1930 near Bend, Oregon. From 600 pounds of fresh material was obtained 986 Gm. of oil by steam dis-

* Scientific Section A. P. H. A. Washington meeting 1934

¹ Seattle, Washington June 7, 1934

tillation, a yield of about 0.36 per cent. Due to various reasons the oil was not examined at the time. Three years later it had resinified somewhat and was, therefore, rectified with steam, giving a light yellow product with a characteristic odor of Juniper.

The constants, determined in the usual way, were d_{25}^4 0.9212, n_D^{25} 1.4745, $[\alpha]_D^{25} +21.91^\circ$, acid number 1.45, saponification number 110.53 (38.17 per cent of bornyl acetate), after acetylation 149.58 (11.06 per cent of free borneol, 41.05 per cent of total borneol). Aldehydes and ketones and primary alcohols were absent or present in very small quantities.

Free Acids—Extraction by 5 per cent sodium carbonate gave a small amount of free acids in which acetic acid was identified by color reactions and by conversion to ethyl acetate. Judging by odor, there may also be present a small amount of acid resembling valeric.

Phenols—Extraction by 5% NaOH solution gave 0.5 per cent of a dark brown liquid with an odor of cresote, which did not solidify above -15°C . No nitroso compound or urethane could be obtained from it, but it gave color reactions similar to carvacrol. With ferric chloride in aqueous solution it produced a violet color and in alcoholic solution a yellow-brown with a green tinge. The Flückiger test with chloroform and alkali resulted in a light red color, somewhat darker than with carvacrol.

The remaining oil was fractionated at 10 mm and that portion boiling below 95°C was repeatedly refractionated.

Fraction	Per Cent	Refraction
155-160°	1.61	
160-162	1.69	1.4700
162-169	10.15	1.4736
169-175	12.30	1.4805
175-180	6.31	1.4845
180-185	2.31	1.4802
Total	34.37	

Camphene—The first fraction $[\alpha]_D +9.9^\circ$, gave no nitrosochloride and probably contained no pinene. Portions of each of the first two fractions were hydrated by the well-known Bertram-Walbaum method, giving light yellow oils. No phenylurethanes could be obtained, but the odor was decidedly that of isoborneol and a camphoraceous odor was noted after oxidation with chromic acid. The amount of oil was too small to permit exact identification, but the presence of some camphene is indicated.

The third fraction was oxidized with potassium permanganate in the usual way for betapinene but no product like sodium nopinate or nopinone could be obtained. This fraction also gave no hydrochloride.

Alpha Phellandrene—Fractions three, four and five gave copious yields of a nitrite melting at 112°C . This was repeatedly dissolved in chloroform and precipitated with methyl alcohol, finally giving a melting point of 114°C . This shows the presence of alpha phellandrene.

Fraction five had an odor of limonene but gave no nitrosochloride and no bromide, nor did fraction four.

Cymene—The last two fractions contained small amounts of cymene, as was

shown by oxidation with hot potassium permanganate to *p*-hydroxy isopropyl benzoic acid, melting at 154–155° C

The oil of higher boiling point was saponified by 3 per cent alcoholic potassium hydroxide for two hours and then submitted to repeated fractionation at 10 mm into three portions

Fraction	Per Cent	Refraction
– 95°	1 07	1 4778
95–120	39 69	1 4744
120–125	1 84	1 4885
Above 125 and loss	23 03	
Total	65 63	

Borneol —The first two consisted almost entirely of borneol which was separated in the crystalline state, melting point 203–204° C, phenylurethane 138° C. Oxidation of the oil gave camphor, identified by odor and by the semicarbazone melting at 235–236° C

Although terpineol was suspected, no nitrosochloride could be obtained from the second fraction. Also cadinene was not present in the last distillate nor in the residue, since no hydrochloride could be obtained

Combined Acids —The alkaline liquor from saponification was concentrated, acidified and then distilled with steam. Practically all of the acid was found in the distillate and appeared to consist almost entirely of acetic acid. This was identified as before by conversion to ethyl acetate

Summary —The fresh leaves and branches gave 0.36 per cent of oil whose composition was found to be about: bornyl acetate 40, borneol 11, alpha phellandrene, cymene and probably camphene 35, acetic acid 0.2, phenols 0.5, compounds of higher boiling point and loss 14 per cent

DRUG EXTRACTION. IV. THE EFFECT OF VARIATION IN SOLVENTS ON THE EXTRACTION OF JALAP^{1,2}

BY WILLIAM J. HUSA³ AND PAUL FEHDER

Jalap having been selected as a typical resin-containing drug, a study was made of the effect of solvents in relation to swelling, penetration, imbibition and extraction

EXPERIMENTAL PART

Material Used —From a reputable dealer, a 125 lb shipment of Jalap U. S. P. was obtained, consisting of 10 lbs whole drug, 40 lbs of 60 mesh and 25 lbs each of 20, 40 and 80 mesh, according to the following specifications. The above samples are to be prepared by taking 125 lbs of jalap, selecting a representative sample of 10 lbs for the whole root and a representative 40 lb sample to be milled to 60 mesh and three separate 25 lb samples to be milled to 20, 40 and 80 mesh, respectively. Each portion is to be milled separately so that all portions will be as nearly alike as possible, except for the difference in milling."

¹ Presented before the Scientific Section, A. P. H. A., Washington, D. C., 1934

² This paper is based on a thesis presented to the Graduate Council of the University of Florida by Paul Fehder in partial fulfillment of the requirements for the degree of Master of Science in Pharmacy

³ Head Professor of Pharmacy, University of Florida

A thorough pharmacognostical study showed that the shipment conformed with the U S P requirements

Swelling of Jalap in Solvents—The swelling effect of solvents was determined by the technique (1) of measuring the width of thin strips of jalap tissue before and after addition of solvents using a filar micrometer. The strips, 0.25 to 0.50 mm in width, were cut from sections obtained by use of a small carpenter's plane. The results are expressed on a percentage basis taking the width of the dry strips as 100 and each value is the average of several determinations. The thickness of the sections was measured by means of a micrometer caliper.

TABLE I—SWELLING EFFECT OF SOLVENTS ON SECTIONS OF DECORTICATED JALAP TISSUE

Solvent	Section	Average Thickness of Section in Mm	Width of Section (on Basis Dry = 100) After Time in Minutes									
			Dry		Wet.							
			0	1	5	10	20	40	60	100	120	
Water	Cross	0.042	100	133	134	134	133	133	134	134	133	
Alcohol	Cross	0.044	100	101	103	106	108	110	109	110	110	
Alcohol	Longitudinal	0.066	100	100	100	105	108	111	112	117	117	

The results in Table I indicate that swelling equilibrium is attained during the first minute in water but only after 40 minutes or more in alcohol. Further tests showed that longitudinal sections swelled 47% during the first minute in water on the average, the swelling was 60-70% in sections containing much transporting tissue and 35-45% in sections consisting chiefly of starch bearing parenchyma. The initial swelling of longitudinal sections in alcohol likewise varied from 6% in sections containing much transporting tissue to 0% in those consisting mostly of starch bearing parenchyma. During the first minute cortical tissue showed neither expansion nor contraction in alcohol while in water pure cork tissue swelled to about twice its original size, outer bark with a large proportion of cork swelled about 40% and outer bark with little cork swelled about 25%.

Penetration of Solvents into Jalap Blocks—Using a special machine saw at the planing mill, blocks were cut with the grain running the long way, the blocks being 10 mm square and averaging 2.4 mm in thickness. Using three blocks for each solvent, these were immersed in water, alcohol and glycerin, respectively, contained in bottles. The bottles were then suspended in a Freas large-size water thermostat, at 30° C. After various intervals, the blocks were removed, excess solvent taken up with filter paper, and the blocks weighed and measured. The chances for error in measuring swelling with a micrometer caliper between surfaces that are somewhat flexible are considerable and may lead to deviations that would not be shown in similar measurements between rigid surfaces. However, by taking the average of several blocks, the degree of error is reduced to an extent which allows helpful conclusions to be drawn.

TABLE II—PENETRATION OF LIQUIDS INTO JALAP BLOCKS

(Average Weight of Three Blocks Stated on Basis Dry Weight = 100%)

	After Time Intervals in Hours													
	0	1	2	3	9	12	24	48	72	96	216	552	720	888
Water	100	194	224	238	208	213	250	243	238	242	233	229	233	228
Alcohol	100	141	141	141	104	104	143	133	135	138	130	131	133	143
Glycerin	100	130	130	130	102	101	130	121	121	122	117	125	130	141

As shown in Table II, the liquids penetrated rapidly during the first hour. Between three hours and nine hours there was a sharp drop in weight of the blocks.

in each of the three liquids probably due to loss of soluble constituents, followed by an increase in weight, reaching a maximum at 24 hours and showing only slight changes thereafter

TABLE III—SWELLING OF JALAP BLOCKS IN LIQUIDS
(Average Thickness of Three Blocks Stated on the Basis Dry = 100%)

	After Time Intervals in Hours													
	0	1	2	3	9	12	24	48	72	96	216	552	720	888
Water	100	109	119	124	131	130	127	127	128	126	123	123	120	121
Alcohol	100	100	100	100	102	101	101	101	101	101	100	101	101	101
Glycerin	100	100	99	99	99	99	98	98	98	98	98	100	101	102

As shown in Table III swelling by water reaches a maximum of 31 per cent in nine hours. From then on, the thickness of the blocks gradually decreases, due apparently to the loss of water-soluble substances. Alcohol causes very little swelling, a maximum of 2 per cent is observed at the end of nine hours. Glycerin causes a slight shrinkage, due possibly to the abstraction of water from the cells, followed by recovery and very slight swelling.

Effect of Solvents on Powdered Jalap—In studying the effect of solvents on powdered jalap, a filtration method devised in the present study but previously described by Husa and Magid (1) was used. The filtrates were assayed for total resins by Warren's method (2). The drug was found to contain 7.87 per cent of resin by the U. S. P. method of assay and 6.87 per cent by Warren's method of assay. Warren reported results of his collaborators, showing a similar lower result by his method than by the U. S. P. method, due, apparently, to removal of coloring matter, sugars and other water-soluble extractives from the resin by Warren's method.

TABLE IV—EFFECT OF SOLVENTS OF JALAP IN No. 60 POWDER

Period of Maceration	Weight in Gm. of					
	Liquid in Marc	Dry Marc.	Filtrate	Loss of Menstruum	Total Extractive	Resins in Filtrate
Absolute Alcohol

24 hours	27 9	6 7	61 5	0 9	2 6	Negligible

* Conducted at room temperature, all others conducted in thermostat at 30° C

From the results in Table IV, it appears that the extraction of resin is as complete in 15 minutes as in 24 hours, but the percentage of total extractive in the filtrates increases with time. With higher percentages of alcohol, imbibition decreases and less extraneous matter is extracted along with the resins. The higher percentages of alcohol extract the same amount of resin but with alcohol 4 vol — water 1 vol and more aqueous mixtures, less resin is extracted.

DISCUSSION OF RESULTS

Effect of Solvents on Thin Strips —Swelling equilibrium in thin strips of jalap tissue was reached within 1 minute, as was the case with chestnut wood (1) and the wood of belladonna root (3). For the same type of jalap tissue, swelling across the grain in liquids was greater in longitudinal sections than in cross sections. Perhaps this means that in a cross section of a fibre or vessel, there is more mechanical resistance to swelling than when the fibre or vessel is split longitudinally.

Penetration and Swelling of Jalap Blocks —There is no direct relationship between the rate of swelling and the rate of increase in weight. At nine hours, the swelling with water and with alcohol is at a maximum, while the weight of the blocks is at a minimum. The blocks immersed in alcohol gained about 40% in weight, while the swelling was not over 2%.

Imbibition and Extraction of Powdered Jalap—Using belladonna root in No 40 powder, Husa and Magid (1) found that imbibition of alcohol-water mixtures increased with decreasing alcohol content, similar results were obtained in the present study using jalap in No 60 powder. As far as present results go, alcohol of U S P strength and absolute alcohol seem to be the best solvents for the extraction of jalap resin, with more aqueous mixtures a greater proportion of inert extractive is removed along with the resin.

SUMMARY

Alcohol, water and glycerin have been studied from the standpoint of swelling effects and rate of penetration, using jalap in the form of thin strips and blocks. Using a series of alcohol-water mixtures in a study of imbibition and extraction of powdered jalap, it was found that with increasing concentration of alcohol there is a decrease in imbibition and a decrease in the proportion of extraneous matter extracted along with the resins.

THE APPLICATION OF STATISTICAL METHODS TO PHARMACEUTICAL RESEARCH IV METHODS OF RECORDING DRUG ACTION

BY J C MUNCH¹ AND F E GARLOUGH²

How much of a drug is required to produce a definite action? This question constantly arises in discussing the narcotic potency of a drug like cocaine, the relative soporific value of several barbiturates, the anesthetic concentration of ether, the cathartic dose of cascara, the lethal or the convulsant dose of strychnine. Official compendiums list the "doses" of drugs as a matter of convenience and of practicality. Many original articles dealing with quantitative measures of drug action, as well as compilations of toxic and lethal doses (9) give tables showing doses per animal or per kilo, which are withstood, which produce injury, which produce the desired type of response, or which produce death within stated time limits.

The general impression is regarding relationship of dose to effect results from the usual method of laboratory study. A series of doses of a product is given to animals and the effects observed. Too small a dose fails to produce discernible or detectable effects; this is a "subminimal" or "subliminal" quantity. As the dose is increased there is a change in the normal appearance of the test animal, which is attributed to the action of the drug. After showing the characteristic response for some time, the effect passes off and the animal recovers. The smallest concentration that produces such a response is often called the "minimum effective dose" (MED). Increases in dose cause greater intensity or prolongation of action until a quantity is reached that causes some of the test animals to die. This dose may be

From the results in Table IV, it appears that the extraction of resin is as complete in 15 minutes as in 24 hours, but the percentage of total extractive in the filtrates increases with time. With higher percentages of alcohol, imbibition decreases and less extraneous matter is extracted along with the resins. The higher percentages of alcohol extract the same amount of resin but with alcohol 4 vol — water 1 vol and more aqueous mixtures, less resin is extracted.

DISCUSSION OF RESULTS

Effect of Solvents on Thin Strips—Swelling equilibrium in thin strips of jalap tissue was reached within 1 minute, as was the case with chestnut wood (1) and the wood of belladonna root (3). For the same type of jalap tissue, swelling across the grain in liquids was greater in longitudinal sections than in cross sections. Perhaps this means that in a cross section of a fibre or vessel, there is more mechanical resistance to swelling than when the fibre or vessel is split longitudinally.

Penetration and Swelling of Jalap Blocks—There is no direct relationship between the rate of swelling and the rate of increase in weight. At nine hours, the swelling with water and with alcohol is at a maximum, while the weight of the blocks is at a minimum. The blocks immersed in alcohol gained about 40% in weight, while the swelling was not over 2%.

Imbibition and Extraction of Powdered Jalap—Using belladonna root in No 40 powder, Husa and Magid (1) found that imbibition of alcohol-water mixtures increased with decreasing alcohol content, similar results were obtained in the present study using jalap in No 60 powder. As far as present results go, alcohol of U S P strength and absolute alcohol seem to be the best solvents for the extraction of jalap resin, with more aqueous mixtures a greater proportion of inert extractive is removed along with the resin.

SUMMARY

Alcohol, water and glycerin have been studied from the standpoint of swelling effects and rate of penetration, using jalap in the form of thin strips and blocks. Using a series of alcohol-water mixtures in a study of imbibition and extraction of powdered jalap, it was found that with increasing concentration of alcohol there is a decrease in imbibition and a decrease in the proportion of extraneous matter extracted along with the resins.

THE APPLICATION OF STATISTICAL METHODS TO PHARMACEUTICAL RESEARCH. IV. METHODS OF RECORDING DRUG ACTION

BY J. C. MUNCH¹ AND F. E. GARLOUGH²

How much of a drug is required to produce a definite action? This question constantly arises in discussing the narcotic potency of a drug like cocaine, the relative soporific value of several barbiturates, the anesthetic concentration of ether, the cathartic dose of cascara, the lethal or the convulsant dose of strychnine. Official compendiums list the "doses" of drugs as a matter of convenience and of practicality. Many original articles dealing with quantitative measures of drug action, as well as compilations of toxic and lethal doses (9) give tables showing doses per animal or per kilo, which are withstood, which produce injury, which produce the desired type of response, or which produce death within stated time limits.

The general impression is regarding relationship of dose to effect results from the usual method of laboratory study. A series of doses of a product is given to animals and the effects observed. Too small a dose fails to produce discernible or detectable effects; this is a "subminimal" or "subliminal" quantity. As the dose is increased there is a change in the normal appearance of the test animal, which is attributed to the action of the drug. After showing the characteristic response for some time, the effect passes off and the animal recovers. The smallest concentration that produces such a response is often called the "minimum effective dose" (MED). Increases in dose cause greater intensity or prolongation of action until a quantity is reached that causes some of the test animals to die. This dose may be

The U S P guinea pig method for the bioassay of aconite requires that 0.060 mg of aconitine per Kg should kill 2 of 3 guinea pigs within 12 hours after subcutaneous injection. This would correspond to 0.06 $\text{mg}_3\text{LD}_{67}$. Compared at this level, the LD_{67} of aconitine for rats was 0.175 mg per Kg showing that approximately 3 times as large a dose of aconitine was required to kill rats as to kill guinea pigs.

In studying the action of picrotoxin upon mice following subcutaneous injections, it was found (20) that doses below 1.5 mg per Kg produced no detectable effect, doses between 2.0 and 3.5 mg per Kg produced convulsions, and doses be

tween 3.0 and 3.5 mg per Kg produced death (Table II and Fig 2). Plotting these results showed a convulsant zone extending on the one side into the non-convulsant, and on the other to the death zone. Bioassays of picrotoxin and its preparations could be made by simultaneous tests upon mice with a standard picrotoxin and the unknown product, to determine the $\text{LD}_{80\%}$, and the activity could be expressed in terms of standard picrotoxin. In general, 5 mg per Kg of picrotoxin produced this effect, although variations in the susceptibility of the mouse colony required the use of doses ranging from 4 to 7 mg per Kg. The CD_{50} was approximately 2 mk, the LD_{50} 4 mk, or twice the CD.

In studying the variations in susceptibility of mice to subcutaneous injections of morphine solutions (19), using the "tail curve" as an index of activity, tests were conducted independently in three different laboratories. Results obtained are shown in Table III and Fig 3 and indicate typical S-curve responses. The differences in quantitative responses in different laboratories indicate the effects of various conditions that were not identical. For this reason it is obviously necessary to standardize the behavior of test mice. These great divergences in different laboratories indicate the futility of attempting to say that a particular dose of morphine is the smallest dose that will produce a typical curvature of the tail.

Our studies upon the lethal doses of strychnine administered subcutaneously, intraperitoneally, incorporated with food or administered by stomach tube to hundreds of ground squirrels, prairie dogs and rats have shown wide species variations. In tests by Moore, Spencer and Ward, under various working conditions, attempts have been made to determine the LD_{10} , LD_{50} , LD_{90} and LD_{100} upon animals deprived of food for 24 hours, then fed bait containing a known amount of strychnine, or injected with 0.5 per cent strychnine solution by stomach tube. In the control of noxious rodents, it is desired to obtain at least LD_{90} and it is ideal to hope for an LD_{100} response. The data obtained on adult animals following oral administration of strychnine in the course of these investigations are given in Table IV and Fig 4. It is obvious that there is a species difference between the Douglas ground squirrel and the Columbian ground squirrel. The former is much more susceptible to small doses, even though the LD_{100} doses are practically identical. The different effects following changes in altitude are observed in the results obtained on rats. In Ward's experiments in Denver (27) at 5280 feet, rats were much more susceptible than litter mates that had been shipped to Portland, Oregon, held there for three months on the same food, and then injected with the same strychnine by Moore (27).

TABLE IV—VARIATION IN ORAL LETHAL DOSE OF STRYCHNINE FOR RODENTS
DOSE IN MG /KG

Animals	Per Cent Killed			
	LD_{10}	LD_{50}	LD_{90}	LD_{100}
Ground squirrel (Douglas)	3.0	8.0	20	22.0
Ground squirrel (Columbian)	8.0	12.0	18	22.5
Prairie Dog (Zuni)	3.0	4.0	5	7.0
Rats—Denver	5.0	7.5		10.0
Rats—Portland	7.5	9.0		12.5

increase in altitude. The LD_{100} was 22.5 mg/kg at 2600 feet, and decreased approximately 1 mg/kg for every 500-foot elevation to an LD_{100} of 15 mg/kg at 6500 feet.

In studies upon Zuni prairie dogs, the season has been found to affect the toxicity, possibly because of the differ-

Tests by Moore on 482 Columbian ground squirrels showed definite variations in susceptibility to strychnine with

Fig 4—Toxicity of strychnine to rodents—oral administration—mg /Kg

ence in tannin content of the food In the spring the LD_{100} was 7 mk, in the fall, 4 mk In these various tests, at various altitudes, and with animals on various diets, however, the response to strychnine has been found to follow an S shape curve, whether considering the convulsant or the fatal dose

CONCLUSIONS

- 1 The standard curve is useful in recording the relation between dose and effect
- 2 Most accurate results are obtained in determining those doses that produce desired responses in half of the animals tested
- 3 By using a subscript before the statement of effect to indicate the number of animals employed, and another after it to indicate the degree of response used as a criterion ($nED\%$), drug action may be quantitatively recorded with maximum convenience and minimum labor

CYANIDE POISONING AND ITS TREATMENT * 1 2

BY K K CHEN, CHARLES L ROSE AND G H A CLOWES

MORTALITY STATISTICS

Cyanide poisoning is less frequent than mercury or strychnine poisoning, although during recent years the death rate from cyanide poisoning has been increasing In Table I it will be seen that in the United States Registration Area there were 134 deaths from cyanide poisoning in 1930, and 243, 408 and 416 in 1931,

TABLE I—MORTALITY STATISTICS FROM CYANIDE POISONING **

Locality	Population (1930 Census)	1922	1923	1926	Total Number of Deaths								
					1927	1928	1929	1930	1931	1932	1933	1934

* Data not available

** In the compilation of this Table, we were greatly assisted by Dr T F Murphy, Chief Statistician for Vital Statistics, Bureau of Census, Department of Commerce Washington who generously turned over to us all the data which he has collected with meticulous care Our indebtedness must also be acknowledged to Doctors J C Geiger, Director of the Department of Public Health, City and County of San Francisco, Herman N Bundesen President of the Board

* This article is based on a scientific exhibit held at the joint meeting of the American Medical Association and the Canadian Medical Association, Atlantic City, June 10-14 1935

¹ From the Lilly Research Laboratories, Indianapolis

² Scientific Section A PH A, Portland meeting, 1935

of Health, City of Chicago, W Thurber Fales, Director of the Bureau of Vital Statistics, Health Department, City of Baltimore, Thomas J Duffield, Registrar of Records, Department of Health, City of New York, G Arthur Blakeslee, Director of the Bureau of Vital Statistics, Department of Health, City of Detroit, Joseph W Monahan, Deputy Commissioner, Health Department, City of Boston, and to health officers of other cities, for their assistance in giving us the figures for 1934 The figures for New York City as given by Dr Murphy are uniformly lower than those recorded in the office of the Chief Medical Examiner of the City of New York as reported by Gettler and St George (14)

1932 and 1933, respectively There was a similar increase in most large cities during the same period Whether or not it was due to the economic depression is a matter for speculation The mortality rate from cyanide poisoning in urban areas does not appear always to depend upon the size of the population For example, San Francisco with a population of 634,394 (1930 census) has a total number of deaths comparable to that of Chicago, the population of which is 3,376,438 Similarly, Los Angeles has a relatively high death rate from the same cause

In general, over 90 per cent of the cases of cyanide poisoning are suicidal in nature Owing to the rigid precautionary measures, death seldom occurs in those places where large quantities of cyanides are handled daily, such as the gold or iron mines, cyanide factories, etc

In the western states, there are several cyanogenetic plants, chiefly the arrow grass and the chokecherry, which have caused annually heavy losses of live stock The following interesting account given by Professor B T Simms, Oregon State Agricultural College, Corvallis, in a private communication to the authors may be cited

"You might be interested to know that this type of poisoning (cyanide) has caused rather serious losses in live stock here in Oregon The common chokecherry has perhaps been the offending plant in the majority of cases One rancher lost 171 sheep during one night last summer from this plant Records show that more than 1500 sheep have died in that one area from chokecherry poisoning during the past four years "

DIAGNOSIS

The diagnosis of cyanide poisoning in men can be easily made if the physician keeps in mind the following points

- 1 Personal history
- 2 Occupational history
- 3 Sudden illness

- 4 Early unconsciousness
- 5 Characteristic odor of breath (smell of 'oil of bitter almonds')
- 6 Rapid and deep respiration in early stages of intoxication
- 7 Convulsions, frequently with involuntary passage of urine and feces These are followed by depression and paralysis
- 8 Cyanosis
- 9 Presence of a cyanide container
- 10 Positive tests for cyanide in the stomach contents or blood

CRUCIAL TESTS IMPORTANT FOR EXPERT TESTIMONY

If a person is poisoned during fumigation, a sample of his blood, 10 to 20 cc, should be drawn. If a person is suspected to have taken poison by mouth, his stomach contents should be evacuated by a stomach tube. If the victim is already dead, the gastric contents should be saved and the liver and kidneys should be removed and analyzed as quickly as possible. It is imperative that the specimens be taken before the body is embalmed. The formaldehyde of embalming fluid reacts quickly with cyanides to form glycollic acid which does not give the chemical reactions characteristic of hydrocyanic acid or its salts. To isolate hydrocyanic acid, the blood, stomach contents or the minced organ, such as the liver or kidney, is definitely acidified with tartaric acid, and subjected to distillation, the poisonous gas being collected in a narrow-mouthed flask. The distillate may be used for various tests.

1 Schonbein's test as modified by Sundberg (1)

Reagents needed Gum guaiac, 0.2 per cent in alcohol, copper sulphate, 0.1 per cent, and tartaric acid.

Procedure Place the suspected fluid in a flask, and acidify with tartaric acid. Wet a strip of filter paper with a mixture of guaiac and copper sulphate in the proportion of 10:3, and suspend it in the flask with a cork. Heat the contents on a water bath.

Interpretation of results A blue color indicates a positive test. The reaction is not specific but very sensitive.

2 Sulphocyanate test

Reagents needed Yellow ammonium sulphide solution, hydrochloric acid, 1 per cent, and ferric chloride, 1 per cent.

Procedure Add to the distillate yellow ammonium sulphide, evaporate the mixture to dryness and dissolve the residue in hydrochloric acid. Warm, filter and add ferric chloride.

Interpretation of results A red color soluble in ether constitutes a positive test. The sensitivity of this reaction is 1:4000:000.

3 Prussian blue test

Reagents needed Ferrous sulphate, 1.5 per cent, ferric chloride, 10 per cent, hydrochloric acid, 10 per cent, and sodium hydroxide, 10 per cent.

Procedure Alkalinize the suspected fluid with 2 drops of sodium hydroxide, and add to it 2 cc of ferrous sulphate solution and 1 cc of ferric chloride. Warm the mixture and cautiously acidify with hydrochloric acid but avoid a great excess.

Interpretation of results A blue precipitate indicates the presence of hydrocyanic acid. The sensitivity of this test is 1:5000:000.

4 U S P method (quantitative)

Reagents needed Ammonia water, 10 per cent, potassium iodide, *N*/1, and silver nitrate, *N*/20.

Procedure Treat an aliquot portion of 25 cc of the suspected fluid with 4 cc of ammonia water and 3 drops of potassium iodide solution and titrate with *N*/20 silver nitrate until a permanent turbidity of silver iodide appears.

Calculations Each cc of *N*/20 AgNO₃ represents 6.5 mg of KCN, or 7.7 mg of HCN.

Equally simple and accurate is the gravimetric method for the determination of hydro-

cyanic acid This involves the steam distillation of the material acidified with tartaric acid The distillate is received in a beaker containing an excess of AgNO_3 The precipitated AgCN is filtered on a tared Gooch crucible and weighed From the weight of AgCN , the amount of HCN or cyanide salt may be calculated

5 Smith's isopurpurate method (quantitative for small amounts) (2)

Reagents needed Picric acid saturated solution, sodium carbonate 5 per cent hydrochloric acid, 10 per cent, and potassium cyanide, $N/500$

Procedure Into a test tube graduated to 25 cc are pipetted 3 cc of picric acid solution, 1 cc of sodium carbonate solution and 1 cc of the solution to be tested Warm the mixture on a water bath Upon cooling, dilute with water to the mark Compare the reddish brown color in a colorimeter with that of the standard prepared in an identical manner, using 1 cc of $N/500$ KCN

Calculation The total amount in the specimen as KCN in mg =

$$\frac{0.13 \times \text{Reading of Standard} \times \text{Volume in cc}}{\text{Reading of Unknown}}$$

Fig 1 —Suggestion for managing a case of Cyanide Poisoning A The antidote kit should be installed in the ambulance or any place that is most convenient B, C and D Showing steps of administering the treatment

NEW METHOD OF TREATMENT

The method to be advocated depends upon Hug's and the authors' laboratory work previously published (3), (4) The antidote chiefly consists of a combination of sodium nitrite and sodium thiosulphate, injected intravenously one after the other Such a combination can detoxify 20 minimal lethal doses of sodium cyanide in dogs, and is ten times as effective as methylene blue To expedite the treatment,

amyl nitrite is also used by inhalation. The recommended dose for sodium nitrite is 0.3 Gm. in 10 cc. of water (3 per cent), and that for sodium thiosulphate 25 Gm. in 50 cc. of water (50 per cent), although an amount of 12.5 Gm. in the same volume of water (25 per cent) is frequently enough. In cases of relapses, one half of the quantity of each should be repeated. So far, three cases of severe cyanide poisoning have been successfully treated with this procedure—two by Viana, Cagnoli and Cendan (5) and the third by Kempf and Richey (6). All three patients recovered, although they had swallowed large amounts of potassium cyanide. The validity of the laboratory results has therefore been clinically confirmed.

It must be pointed out here that the antidotal action of amyl nitrite against cyanide was first demonstrated by Pedigo (7), that of sodium nitrite by Mladoveanu and Gheorghiu (8), and that of sodium thiosulphate by Lang (9). It is the combination therapy that is of recent development.

In order to make the treatment most effective, it is suggested that a kit containing 12 pearls of amyl nitrite, 2 ampuls of sodium nitrite, 2 ampuls of sodium thiosulphate, 2 sterile syringes, 10 and 50 cc. sizes respectively, 1 file and 1 stomach tube be installed in the ambulance, as is practiced at the Indianapolis City Hospital (Fig. 1A), or in any place where it is most easily accessible. These ampuls have proved to be stable for more than a year with appropriate preservatives and the usual precaution. A team of three individuals is necessary for the best management of a case of cyanide poisoning. In step 1 (Fig. 1B) the physician in charge loads his 10 cc. syringe with sodium nitrite, assistant No. 1 washes out the patient's stomach, and assistant No. 2 initiates the treatment by giving inhalation of amyl nitrite. In step 2 (Fig. 1C), the physician injects sodium nitrite by vein, assistant No. 1 finishes washing the stomach and assistant No. 2 withdraws the amyl nitrite and loads the 50 cc. syringe with sodium thiosulphate. In step 3 the patient should be watched for 24 to 48 hours after the completion of the thiosulphate injection by the physician. If poisoning results from fumigation, gastric lavage is of course not necessary.

The rapidity of death from cyanide poisoning has been justly emphasized in teaching and textbooks, for most patients do die within 30 to 60 minutes. On the other hand, one must also remember that many others may linger for several hours. Doctor G. F. Kempf of the Indianapolis City Hospital showed us the record of a man poisoned with hydrocyanic acid gas in fumigation. The victim did not die instantly but lived a little more than three hours. This happened in 1928. Oxygen therapy and stimulants were the only measures employed. Hanzlik and Richardson (10) adequately state "that clinical cyanide poisoning is not always as rapidly fatal as may be imagined from animal experiments or textbook statements. There is generally considerable cyanosis in man, and symptoms or unconsciousness may be present for two or three hours, which ordinarily will be ample time for administering treatments suggested." The combined therapy with sodium nitrite and sodium thiosulphate has saved dogs even after their respiration has ceased. It is reasonable to assume that this also holds true in men. As long as the victim's heart still beats, the clinician should consider the case hopeful and treat it without delay.

Clawson, Bunyea and Cough (11), (12), (13) conducted numerous experiments in sheep and cattle, and clearly demonstrated that the same method of treatment can be applied to live stock poisoned by cyanogenetic plants.

SUMMARY

This paper is a general but brief résumé of cyanide poisoning. It deals with the mortality statistics, sources of poisoning, the diagnosis, crucial tests for legal pur-

poses, and the treatment The new antidote advocated chiefly consists of a combination of sodium nitrite and sodium thiosulphate Precise instructions as to how a case of cyanide poisoning should be managed are given

The authors are indebted to Dr Clarence W Muchlberger, Cook County Coroner's Toxicologist and Assistant Professor of Toxicology and Pharmacology, Northwestern University Medical School, Chicago to Dr R N Harger Professor of Biochemistry and Toxicology Indiana University Medical School and to Dr Charles L Rouiller, Chemist Edgewood Arsenal, Maryland, for their suggestions and criticisms in the preparation of this manuscript

CARBO ACTIVATUS *1

BY JOSEPH ROSIN,² GEO D BEAL³ AND CHESTER R SZALKOWSKI⁴

The demand on the part of the medical profession for a charcoal superior in adsorptive powers to Carbo Ligni U S P X culminated in instructions from the present Sub-committee on Scope to admit a carbon from any source, standardized for its adsorption potency

Decolorizing carbons have, during the past twenty years, assumed a prominent position both in industry and in the chemical laboratory Such carbons have had their decolorizing powers greatly benefited by chemical treatment, and it is likely that such beneficiation received its greatest impulse during the late war in the production of adsorbent carbon for gas mask canisters

During the past few years, more thoughtful physicians and pharmacists have experimented with activated carbons for internal medication with a considerable degree of success. Many theories and counter-theories have been evolved, and some have denied that charcoal could have any place in medicine. Clinical experience has triumphed, however, and to-day there is a growing interest in the use of adsorptive agents in medication.

Adsorbent carbons may be produced by the charring of different forms of organic matter. Among these are wood, bone, blood and various industrial wastes. During the past few years one of the most promising has been produced by carbonizing sulphite waste liquor from the pulping of wood for paper. Mere carbonization, as a rule, is not sufficient, so that activation is resorted to, which usually involves some sort of chemical treatment. Mystery surrounds some of these processes, while others are carefully protected by patent, so that a bibliography of activation methods would be out of place here.

Having in mind some of the chemical treatments that have been proposed for activation, we have paid particular attention to chemical impurities in the carbon, and tests for purity have assumed an importance exceeded only by the evaluation of adsorptive properties. Tests for the determination of the purity, *i e*, freedom from toxic or inert substances, are based upon those commonly applied for these same substances, modified in some instances to suit the combination in which these agents may be found. These tests may be quickly summarized as follows:

The loss on drying at 120°C , *i e*, moisture, does not exceed 15 per cent.

The ash, obtained upon ignition in a platinum crucible, does not exceed 4 per cent.

The acid-soluble substance in 1 Gm, found by boiling the carbon with 1 to 4 hydrochloric acid and determining the sulphated ash in the extract, does not exceed 0.035 Gm.

The carbon contains no coloring principles soluble in boiling normal sodium hydroxide.

Upon boiling 3 Gm of carbon with 60 cc of distilled water and filtering, the filtrate is colorless and neutral to litmus, and 10-cc portions of the filtrate contain no more chloride than 1.5 cc of fiftieth-normal hydrochloric acid and no more sulphate than 1 cc of fiftieth-normal sulphuric acid.

The carbon yields no hydrogen sulphide on boiling with hydrochloric acid, nor hydrocyanic acid on distilling with tartaric acid.

A solution prepared by the combined solvent action of diluted hydrochloric acid and bromine water fails to respond to the usual tests for heavy metals.

These tests, however important they may be in demonstrating the harmlessness of the carbon on internal administration, play no part in determining the possible therapeutic efficiency of the material.

The German Pharmacopoeia is the only one that to this time has made any determined effort to provide a thoroughly adsorbent carbon. Reliance has been placed in the adsorption of methylene blue and of mercuric chloride. In the first instance it is directed to add 25 cc of methylene blue solution (0.15 Gm in 100 cc of water) to 0.1 Gm of carbon that has been dried at 120°C and finely powdered. It is expected that this volume of solution will be decolorized, so it is directed to add further 5-cc portions of methylene blue until no more decolorization is obtained.

At least 35 cc of methylene blue solution must be required to produce a blue color perceptible after five minutes' shaking. This indicates an adsorption capacity for 0.525 Gm of methylene blue per Gm of carbon.

The requirement of the Swiss Pharmacopœia is that 0.2 Gm of dried adsorbent carbon must decolorize 32 cc of methylene blue solution, of the above concentration, during five minutes' shaking. This amounts to an adsorption capacity for 0.24 Gm of methylene blue per Gm of carbon.

Our first experiences in applying the methylene blue adsorption test to activated carbon were quite unsatisfactory. The finer particles of carbon resist sedimentation, so that we had great difficulty in determining the end-point with any degree of delicacy, due to the obscuring of a faint blue color by the suspended matter. Even when sharp end-points were obtained, the best carbons failed by more than 30 per cent of having the required power of the German Pharmacopœia. This did not seem to be within reason, since these carbons were industrial products treated to enhance their decolorizing properties.

Saturation of the carbon is best obtained by reliance on the mass effect of an excess of dyestuff. Several procedures for the quantitative determination of methylene blue being available, we used our own modification of the iodometric method to determine such an excess after treatment with the carbon. When tenth normal iodine is added to an aqueous solution of methylene blue containing 3 per cent or more of sodium acetate as a buffer a periodide of methylene blue is precipitated, and the consumption of iodine, determined by titration of the filtrate with sodium thiosulphate, is 6 atoms for each molecule of methylene blue.

The method finally decided upon reads as follows:

'Dissolve 0.25 Gm of methylthionine chloride (methylene blue) in enough distilled water to make 250 cc of solution. Measure exactly 50 cc of the solution, at 25° C, into each of two 100 cc glass stoppered flasks. To one flask add exactly 0.25 Gm of Activated Charcoal, stopper the flask and shake vigorously for five minutes. Filter the contents of each flask through a filter which has not been previously moistened, rejecting the first 20 cc of each filtrate. Measure exactly 25 cc of each remaining filtrate into 250 cc volumetric flasks. Add to each flask 50 cc of a solution of sodium acetate (1 in 10) and mix thoroughly, then add from a burette 35 cc of tenth normal iodine, keeping the mixture in constant rotation. Stopper the flasks and allow them to stand for fifty minutes, shaking vigorously at intervals of ten minutes. Dilute each mixture to exactly 250 cc with distilled water, mix thoroughly, allow to stand for ten minutes and filter each through a filter that has not been previously moistened, rejecting the first 30 cc of each filtrate. Determine the excess of iodine in 100 cc of each filtrate by titration with tenth normal sodium thiosulphate. The difference between the two titrations, multiplied by 5, amounts to not less than 3.5."

One cc of tenth-normal iodine is equivalent to 0.005328 Gm of methylthionine chloride. Sixteen samples of carbon, including wood charcoal, sponge charcoal, bone-black and activated carbons, adsorbed methylthionine chloride equivalent to from 0.505 to 4.789 cc of tenth-normal iodine per 0.25 Gm of carbon, corresponding to from 1.08 to 10.02 per cent of the weight of activated carbon. Carbon, in order to satisfy the U. S. P. monograph, must adsorb approximately 7.5 per cent of methylthionine chloride.

The German Pharmacopœia also determines the degree of adsorption of mercuric chloride by activated carbon.

Two tenths Gm of dried and finely sifted carbon is shaken for five minutes with 200 cc of a 0.3 per cent solution of mercuric chloride and then filtered through a previously unmoistened filter, rejecting the first 25 cc. 100 cc of filtrate is then treated with 25 cc of tenth-normal sodium arsenite and 3 Gm of potassium bicarbonate, heating the mixture to boiling for five minutes. After cooling one adds 3 cc of diluted hydrochloric acid and titrates with tenth normal iodine. The titration must require at least 8.8 cc of tenth-normal iodine, so that at most 16.2 cc of tenth-normal sodium arsenite will be consumed in the reduction of the unadsorbed mercuric chloride. The minimum adsorption required is 0.08 Gm of mercuric chloride per 0.1 Gm of carbon.

Careful consideration was given to the mercuric chloride method, and quite satisfactory results were obtained. The determination of the unadsorbed mercury requires a somewhat roundabout procedure, involving the use of two standard solutions, sodium arsenite and iodine, and intermediate boiling and cooling. For these reasons, and because the adsorption of metallic salts is not a normal use of activated carbon, the method was not recommended for adoption by the U S P XI.

With the adsorption of methylene blue representing one type of toxin elimination by the use of activated carbon, a study was made of the use of more definite organic bases as standardizing agents. Several alkaloids were tried for this purpose, but strychnine was selected as the reagent to be used, both because of its rapid and uniform adsorption and because of the availability of positive precipitation reactions for small amounts of strychnine. Directions for the test as adopted for U S P XI are as follows:

"Dissolve 0.1 Gm of strychnine sulphate in 50 cc of distilled water, add 1 Gm of Activated Charcoal, shake the mixture vigorously for five minutes, filter immediately through a dry filter, and reject the first 20 cc of filtrate. The addition of 1 drop of hydrochloric acid and 5 drops of mercuric potassium iodide T S to a 10 cc portion of the subsequent filtrate produces no turbidity."

One of the most important uses of activated charcoal is believed to be the adsorption of gaseous products of fermentation or putrefaction. Attempts were first made at the standardization of its adsorptive capacity for carbon dioxide. The method used consisted of passing the gas into an aqueous suspension and determining the gain in weight. Concordant results were not obtained, and it was also believed that the presence of carbonate ash might produce a false adsorptive power. Experiments leading to the measurement of the adsorption of hydrogen sulphide in gaseous form were more promising, and led to the final adoption of a method for U S P XI, reading as follows:

"Into each of two flasks place 185 cc of distilled water and 5 cc of glacial acetic acid and mix thoroughly. By means of a pipette add to each flask 10 cc of a solution of 2.5 Gm of crystallized sodium sulphide in 100 cc of distilled water, placing the tip of the pipette at the bottom of the flask during delivery. Rotate the flask gently for thirty seconds, add to one of the flasks 1 Gm of Activated Charcoal, stopper the flasks and shake them for five minutes. Filter the contents of each flask through a filter that has not been previously moistened, rejecting the first 20 cc of each filtrate. Titrate 100 cc of each subsequent filtrate with tenth normal iodine, using starch T S as the indicator. The filtrate from the Activated Charcoal consumes at least 5 cc less of tenth normal iodine than the filtrate from the solution to which no Activated Charcoal was added."

This amounts to a minimum adsorption of 0.01704 Gm of hydrogen sulphide per Gm of charcoal.

A summation of the application of the qualitative and quantitative tests mentioned herein is given in the following table:

AMERICAN SCIENTIFIC CONGRESS

President Cloyd Heck Marvin of George Washington University, has been named by President Roosevelt to serve as chairman of the delegation from the United States to the seventh American Scientific Congress, to meet in Mexico City September 8th to 17th. Two other Washingtonians, Dr. Neil M. Judd of the United States National Museum and Dr. Francis V. Scholes of the Carnegie Institution of Washington are members of the delegation. Other members are President Wallace Walter Atwood of Clark University, Dr. J. McKeen Cattell, editor of *Science*, President Franklin Stewart Harris of Brigham Young University and Prof. Edward V. Huntington of Harvard University.

ADDRESS OF THE PRESIDENT OF THE AMERICAN
PHARMACEUTICAL ASSOCIATION

BY ROBERT P FISCHELIS

Ladies and Gentlemen of the American Pharmaceutical Association

The duties of the president as provided for in the By-Laws include the preparation of an address to be presented at the first general session of the annual meeting. It is not specified whether this address shall constitute a report of the activities of the president or of the ASSOCIATION, or whether it shall be upon some other subject deemed pertinent to the occasion. Custom has doubtless influenced the decision of former presidents in this regard and we have had, on occasions like this, a series of forceful expressions of conditions in the practice of pharmacy, records of activities pursued during the presidential year and occasional suggestions and recommendations with respect to future activities. At times these suggestions and recommendations have led to the adoption of new policies and procedures which have left their mark upon American Pharmacy. More frequently, perhaps, the suggestions and recommendations have been received with varying degrees of respectful attention, and have been just as respectfully consigned to the limbo of forgotten things. The eighty-third president therefore enters upon the discharge of this duty with no illusions.

ROBERT P FISCHELIS

It has always seemed to me somewhat anomalous to have the outgoing president follow the review of activities of his administration with recommendations to be carried out by his successor, when that successor has been elected eight months before taking office and very likely has some ideas of his own as to what should be done. Would it not be more logical for the president-elect to be given an opportunity to submit a program for the ensuing year and have that program passed upon by the convention and then, while president, take the lead in carrying out the approved suggestions rather than to inherit what is left of a program that may be submitted by an outgoing president?

If the president-elect submits the program he is more apt to insist upon its careful and immediate consideration because he has a year ahead of him in which to act. The outgoing president submits his program three days before he leaves office and he knows that whether it is accepted or rejected his official responsibility in connection with it ceases within three days. Unless there is unusual coordination between the outgoing and incoming presidents, it is my judgment that the ASSOCIATION loses a great deal by the present arrangement. The unusual coordination referred to can take place only when the retiring and incoming presidents happen to be so located, geographically, that they can confer frequently. Such a situation is very unusual. I have discussed this matter with various officers of the ASSOCIATION

and there seems to be no objection to the idea of giving the president-elect an opportunity to submit a program at the convention at which he takes office. The only practical difficulty would be presented at the meeting at which the change is to take place. I suggested that I would be willing to give my time this year to the president-elect but it was considered inadvisable by others to inaugurate the plan without approval by the ASSOCIATION. However, we have arranged to give the president-elect such time as he may desire for a message at the final general session of this Convention although this will not allow an opportunity for action upon possible recommendations.

President-elect Costello has wisely pointed out, in connection with this matter, that if the president-elect is to submit his program at the beginning of his administration, we must also make provision for keeping him informed of the work carried on by the organization during the year preceding his incumbency. This would mean that the president-elect should become a member of the Council immediately upon being elected.

ATTITUDE TOWARD THE PRESIDENCY

It is not difficult to imagine several attitudes toward the administration of this office. If it happens to be occupied by one accustomed to administrative duties, he is apt to look upon the presidency of this ASSOCIATION very much as he would upon the presidency of a business enterprise or institutional activity. Under such circumstances the president would expect to make decisions on matters which arise during his term of office, receive reports of other officers and committees and act upon them in accordance with the expressed policy of the ASSOCIATION, or, if there has been no expression of policy, then upon the best advice obtainable and with the exercise of his own judgment. He would expect to take the initiative in promoting the interests of the ASSOCIATION in its recognized sphere of activity and represent the ASSOCIATION publicly where such representation is in order or essential to its progress.

If the presidency is occupied by one who has been elected because of distinguished scientific or professional attainment, and to whom administrative duties are irksome, he is apt to take the position that such duties should be assumed largely by others and he might confine himself to literal compliance with the By-Laws.

Another attitude which may be taken, regardless of the particular attainments of the occupant of the office, is that the general affairs of the ASSOCIATION are of no particular concern to the president after he has appointed certain committees and that his chief function is to preside at the annual convention and act otherwise very much like an ornamental constitutional monarch, being careful of course not to omit "the speech from the throne."

The more one studies the By-Laws of our ASSOCIATION the more it becomes apparent that the presidency was probably not intended to be a position in which forceful leadership should be exercised and that in furtherance of this policy the possible exercise of such leadership has been surrounded by so many barriers as to discourage a man of ordinary initiative.

If the By-Laws provided for the assumption of leadership by some other

officer, it would be a waste of time to make these remarks about the presidency. The fact is that no single officer of our ASSOCIATION is at present designated as the executive officer. It is, therefore, quite natural for the members of our ASSOCIATION and pharmacists, generally, to think of the presidency of the AMERICAN PHARMACEUTICAL ASSOCIATION in terms of leadership and active administration. Accordingly I have tried, within the limits of my ability, to satisfy the demands of the office as it is conceived by the rank and file of pharmacists, by other professions and by the public.

Naturally I have found it impossible to please everybody. I knew in advance how useless it would be to try to please some, but I have tried to keep before me constantly the cherished ideals of those who vision Pharmacy as essentially a profession of service to humanity. If in so doing I have at times incurred the displeasure of those to whom pharmacy is essentially a source of material profit, I am not greatly disturbed. The results of our efforts speak for themselves and in the words of the immortal Lincoln whose statue, housed in that glorious memorial structure, looks down upon our own building in the City of Washington:

"I do the very best I know how, the very best I can, and I mean to keep doing so till the end, if the end brings me out all right, what is said against me won't amount to anything."

ACTIVITIES AND OBJECTIVES

We have had a very busy year. The reports of the other officers and committees will give you detailed information of what has been accomplished and what plans are in store for the future. It would be impossible for me to recount in the time available even the high spots of our many and varied activities. However, I am cognizant of the fact that we are meeting in a section of our Country which we have never visited before as an ASSOCIATION. Therefore it may not be amiss to call attention briefly to the fundamental objectives for which our ASSOCIATION was organized and to devote some time to an appraisal of our present activities in the light of these objectives.

The seven objects of the ASSOCIATION as outlined in its Constitution may be briefly stated as follows:

- 1 To improve and regulate the drug market by preventing importation of inferior, adulterated or deteriorated drugs, and by detecting and exposing home adulterations
- 2 To encourage such relations among pharmacists, physicians and the people at large as may promote the public welfare and tend to mutual strength and advantage
- 3 To improve the science and art of pharmacy by the diffusion of scientific knowledge among pharmacists, stimulating discovery and invention, encouraging home production and manufacture, fostering a pharmaceutical literature and developing inherent talent among its members
- 4 To regulate apprenticeship and employment so as to prevent as far as possible the evils flowing from deficient training in the responsible duties of preparing, dispensing and selling medicines
- 5 To suppress empiricism and to restrict the dispensing and the sale of medicines to educated pharmacists
- 6 To uphold standards of authority in education and in theory and practice of pharmacy

- 7 To create and maintain a code of ethics in keeping with the professional knowledge and function of the pharmacist and designed to protect the public to the highest degree

If we were to start to-day—eighty-three years after the founders—to lay down a platform upon which American Pharmacy might take its place with other health professions, we could hardly conceive of a more inclusive statement of desirable objectives

FOOD AND DRUG LEGISLATION

The first of these objectives has been brought very close to us in the past two or three years because of the endeavor to revise the Federal Food and Drug Act. Pharmacists have been conscious of the need for such revision for many years. The need for some control over the advertising of drugs and medicines by means of radio, newspapers and magazines has become more and more necessary as advertisers have become bolder in their methods and have so far exceeded the bounds of propriety and even decency in their announcements as to call down upon themselves the censure of broadcasting companies and the better class of publications. If truth is important in any field it is so in matters having to do with the public health and especially in expounding the virtues of drugs and medicines.

The proposed food and drug law known as the Copeland bill, which has passed the Senate and is now before the House of Representatives for action, places the control of advertising of foods and drugs in the hands of the Food and Drug Administration. This is as it should be. There has been some agitation to separate the control of advertising from the control of other features governing the manufacture and distribution of drugs and medicines by placing it in charge of the Federal Trade Commission. Such control as is now exercised by the Federal Government over advertising, generally, is in the hands of the Federal Trade Commission. This is so, because this Commission has to do with the control of unfair competition. It has the power to regulate advertising if it involves unfair competition. Thus, if the manufacturer of a brand of aspirin states in his advertising that his product is fresh because of the way in which it is packaged, or that it does not affect the heart, and intimates through his advertising that other brands are not fresh because they are not packed in a certain way, or that they do affect the heart, his competitors may prevail upon the Federal Trade Commission to cite him for unfair competition and to cause him to cease and desist from this practice under penalty of a fine.

The fact that such advertising may have been misleading to the public in so far as therapeutic action is concerned, does not interest the Federal Trade Commission because its function is not to protect the public health, but to protect industry. It would be a calamity if a branch of the Federal Government whose chief function is trade promotion should be entrusted with the control of the advertising of medicines, even though new powers were granted the enforcing agency under the Food and Drug Act. The point of view of a trade promotion bureau and that of a public health agency are so totally different that it is inconceivable that the Congress of the United States should give serious consideration to the pleas of those who would transfer any part of the function having to do with the administration of food and drug laws to a trade agency. I took this position when I appeared before the Senate and House Committees which conducted hearings on the bill.

The necessity for including cosmetics in the regulatory provisions governing the manufacture and distribution of foods and drugs has been apparent for a long time. Pharmacists have known of the danger lurking in the use of certain types of cosmetic preparations and the lack of information available on the label of these products, which have frequently contained poisonous ingredients, has been sufficient to classify many of these products as definitely detrimental to health. This ASSOCIATION is on record as approving the inclusion of the regulation of cosmetics in the Food and Drug Act, and I so informed the Committees of Congress.

The proposed law contains a basic weakness with regard to adulteration. I refer to the so-called "Variation Clause." The bill states that, "No drug shall be deemed to be adulterated under this paragraph because it differs from the standards of strength, quality or purity, therefore set forth in an official compendium, if its standards of strength, quality and purity be plainly stated on its label." Here we have the old policy of *caveat emptor*—let the buyer beware—at its best. Allowing the use of an official name without requiring the product to be of official strength is nullification of the fundamental principle upon which uniformity in drugs and medicines is based. Pharmacopœias were brought into being for the purpose of unifying standards of drugs and the first step toward such unification is an established nomenclature. Tincture Digitalis U S P should mean a product of definite strength from coast to coast. If its standard of strength is not proper let it be changed by the Revision Committee. If several strengths of the tincture are required let them be recognized under official titles but we should not permit the official title to be used for a product that is not of the official strength. The provision of the proposed law which requires only a statement of the standard of strength on a label, if the product differs from the official standard, without indicating how the strength differs from the official standard, opens the door to fraud. This ASSOCIATION is on record against the use of official titles unless products so labeled meet official standards and I so informed the Committees of Congress.

I also took the stand that the request of the Food and Drug Administration for authority to permit unrestricted seizures of shipments of drugs misbranded in such a way as to be grossly deceptive, should be granted. We have been on record for some time in favor of partial formula disclosure. The act provides for partial formula disclosure which is a long step in the right direction, and of course I publicly favored this. The Copeland bill as passed by the Senate and submitted to the House of Representatives is weak in many particulars but as I pointed out in a recent editorial in our own JOURNAL, the time has come to take some definite action so that the element of uncertainty as to future regulation may be removed and the revision of state laws no longer delayed. If enacted in its present form, this proposed law will so vastly improve regulation of the food and drug industries that we are warranted in giving it our approval. It was necessary to spend three days, immediately preceding departure for this meeting, at Washington before the House Subcommittee which has this measure in charge. The outlook for passage of the bill at this session of the Congress appeared favorable.¹ In dealing with the Food and Drug Legislation it has been very gratifying to have the active and effective support of the American Association of Colleges of Pharmacy.

¹ Adjournment of Congress in August left insufficient time for final action on the bill and it was carried over to the next session.

I have dwelled at length on this phase of our activity because it is without doubt one of the most important factors in the progress of pharmacy and it is a question on which the public interest transeends the private interests of those engaged in the manufacture and distribution of drugs and medicines. In my judgment, we have shown the Committees of Congress and the general public that we recognize this. I do not believe that we could have done so by allowing any other organization to speak for us or by having the representatives of our ASSOCIATION speak for other branches of the drug industry. The situation called for a positive attitude toward this great public question. I did not feel that those who were engaged in the controversies arising out of the drastic food and drug legislation originally proposed and who doubtless rendered a great service in clarifying the issue, were in the best position to meet the new situation. Therefore I assumed personal leadership in the matter. I was well aware of the criticism this might arouse in certain quarters, although I did not expect the low type of personal attack indulged in by some. These are matters that can be attended to after I leave the presidential office. I am certain in my own mind that the position I have taken has brought honor and credit to the AMERICAN PHARMACEUTICAL ASSOCIATION in places where honor and credit mean something to American Pharmacy. I hope you will agree with me and if you do, I ask that you endorse what I have done.

PROFESSIONAL AND PUBLIC RELATIONS

Our second objective, having to do with professional and public relations, offers a splendid opportunity for a type of leadership which is sorely needed in American Pharmacy to-day. Most assuredly it is the AMERICAN PHARMACEUTICAL ASSOCIATION which should take the initiative in promoting better relations between pharmacists, physicians, dentists and other health workers and with the public.

I wish to call attention to some of our activities and accomplishments in this direction and point to possibilities for future effective work.

In 1931 the ASSOCIATION authorized the appointment of a Committee on Professional Relations. For some reason unknown to me the committee was never appointed. The need for active cooperation with the medical, dental, nursing and other professions along various lines being apparent, I appointed such a committee this year headed by Leonard A. Seltzer of Detroit with Dean Roland T. Lakey as secretary. An immediate need was felt for a representative from each State to cooperate with this committee. It seems to me that the voting delegate from each State Association to our House of Delegates could furnish the proper contact for this Committee with State groups representing the various professions and I so recommend. We now have a number of State Councils or State Conferences of the Allied Medical Professions actively engaged in the study and consideration of professional and economic problems affecting all professions. In some states these conferences are limited to the health professions. In others they include teachers, lawyers and additional groups. To all such Councils or Conferences we can supply helpful information and guidance on pharmaceutical questions.

It is important that our professional relations be governed by sound thinking, plain speaking and effective action. To this end we should be well informed of the views and opinions of other professional groups. The auxiliary committee of State

Delegates can keep the Committee on Professional Relations informed of developments within the states and it, in turn, should study all proposals involving cooperation between the professions in matters affecting public health, medical care, emergency relief, the use of official drugs and the regulation of the professions, and make such recommendations to the ASSOCIATION as may be indicated

We have endeavored to maintain the most friendly relations with the medical and dental professions. The emergency relief programs of the Federal and State Governments have had a tendency to emphasize the inter-relations of the health professions. The designation of U S P, N F and special formulary non-proprietary drugs for exclusive use in emergency relief prescribing has given an impetus to prescription writing which requires a high type of pharmaceutical practice. This is in the interest of the patient as well as the professions. The efforts of pharmacists all over the United States in meeting the demand for emergency relief prescription service at reduced fees is to be commended and is an indication to the Government and to the public that we can be depended upon to do our part whenever emergencies arise.

For a number of years the Council on Pharmacy and Chemistry of the American Medical Association has not had in its membership the same quota of pharmacists originally included in its make-up. We can recall with pride the services of Puckner, Wilbert, Hallberg, Kraemer and perhaps others to this very useful agency. It is probable that the organization of a Council or Committee with similar activities by the AMERICAN PHARMACEUTICAL ASSOCIATION was discouraged because American Pharmacy was given representation on the Council on Pharmacy and Chemistry of the American Medical Association. The present policy seems to be not to replace pharmacists removed from the Council by death, with other qualified pharmacists. It does not seem to me that such a policy will be of benefit to the American Medical Association in the long run and it is hoped that when future vacancies on the Council occur, a pharmacist or two will be named as members so that the very important viewpoint of professional pharmacy will not be eliminated from the deliberations of this all-important and extremely useful Council. An effort should also be made to place a pharmacist or two on the Council on Dental Therapeutics. Here we have points of contact between medicine, dentistry and pharmacy through which a very useful service can be rendered by our profession. They should not be overlooked.

It is unfortunate that our official formularies have not made available to physicians a variety of combinations of active drugs with suitable adjuvants and vehicles such as are furnished under various proprietary names and, of course, at proprietary prices. This situation has led to the preparation of various special formularies promulgated by hospital organizations, State and County medical and pharmaceutical societies and is apt to result in a certain amount of confusion especially if such local formularies multiply. The original objective of the United States Pharmacopœia and National Formulary was to bring about uniformity in standards for drugs and formulas. To avoid the confusion existing before these standard works came into being, they must be kept in step with the progress of the times and supply existing needs by means of frequent supplements. Decennial revision is no longer sufficient to meet existing needs. In this connection a way should be found to supply supplements to the official standards, when issued, di-

rectly to all subscribers to the official books, at no addition to the original cost of the books

Cognizance should also be taken of the recurring agitation as to the constitutionality of the present system of issuing and revising the *United States Pharmacopœia* and *National Formulary*. If there is any doubt about the legality of the present method of revision, we have nearly five years before the next decennial revision in which to obtain Congressional action to authorize issuance of these standards by revision committees called into being by the Congress, if that is necessary. Knowing the slow process by which Congressional action is obtained in these matters, we should not delay our efforts to place the revision of these standards on a firm and sound legal foundation.

Our relations with the public have been enhanced considerably through the completion of the headquarters building in Washington, the continued observance of Pharmacy Week and various public contacts by representatives of the professions with civic and public health groups and through the medium of the public press. Our building in Washington attracts the attention of many visitors to the capital city and provides a tangible expression of the place of the pharmacist in the progress of scientific medical care.

It was my privilege, as president of our ASSOCIATION, to inaugurate Pharmacy Week last October with a fifteen-minute message from Station WEAJ, Radio City, New York, over a network of the National Broadcasting Company. Reports indicate that the professional window displays made by pharmacists throughout the United States and other features of the observance of Pharmacy Week were of a high order. However, there has been considerable complaint of the manner in which some radio advertisers of drug products have sought to tie up their sales talks with the professional features of Pharmacy Week. Time donated by radio advertisers for purely professional messages during Pharmacy Week constitutes a real contribution to the purpose of this "Week." However, when a purely commercial broadcast is connected with a Pharmacy Week message, it defeats the object of the "Week" which is not to urge people to buy medicines or toilet articles but to be reminded of the professional services rendered by the pharmacist. Radio advertisers who unite their advertising with Pharmacy Week messages are contributing nothing to this movement. On the contrary, they are selfishly taking something away from it.

Throughout the year newspapers, pharmaceutical journals and other publications, including the official journal of the American Association for the Advancement of Science, have carried messages, articles and reports of addresses by your officers and Committee members.

The economic phases of the practice of medicine are occupying the best minds among physicians as well as social workers. Dr. A. C. Christie in his recent book on the "Economic Problems of Medicine" makes the following significant statement: "The doctor entering private practice, finds that medicine is not only a profession, but a business as well." The public is conscious of the fact that there is a business phase to medical care. It has no special interest in regulating the professional phases of medical practice, but it is claiming more and more of a voice in the regulation of its business phases. This development cannot be stopped by ignoring it and the medical profession is finally, although with evident reluctance, making an

effort to meet the situation which has caused the outcry against high costs of medical care. We should watch developments in this field with great care and anticipate probable trends with a constructive program of our own. Such things cannot be developed over night. When the Federal Committee on Economic Security had in process of development what has since become the Social Security Act, we kept in very close touch with the program. State Associations were asked to gather information and transmit it to our Washington office. We were finally informed that the immediate plans of the Government contemplated no application of the insurance principle to the furnishing of drugs and that the per capita expenditure for necessary drugs and medicines does not reach a figure which warrants elimination of the retail pharmacy as a source of supply for drugs under any scheme of socialization of medical services.

Emergency Relief Administrations and other organizations engaged in providing medical care find the many easily accessible pharmacies a convenience in supplying necessary drugs and related items. Hence the agitation for centralized drug dispensaries manifested occasionally in some quarters has made little or no headway.

While there is no justification for the concentration of great numbers of pharmacies or drug stores in centers of population which can be served as well or better by half the number actually available, there is something to be said for a logical distribution of pharmacies so as to maintain suitable and convenient pharmaceutical service to the public. In pharmacy as in medicine and dentistry it is essential that the personal relations between those giving professional services and those receiving them be maintained.

PUBLICATION PROGRAM

Our third objective referring to the diffusion of scientific knowledge and fostering pharmaceutical literature is being cared for through our JOURNAL, the National Formulary, the Recipe Book, occasional bulletins and special publications issued from time to time.

In my correspondence with the membership and in my personal contacts with them, I have gained the distinct impression that our present JOURNAL does not meet the needs of the average pharmacist in a number of particulars. There is also some dissatisfaction on the part of those wishing to use the JOURNAL as a medium for the publication of lengthy scientific papers. The mere statement of these facts is sufficient to call attention to the difficult problem faced by the Editor. The ASSOCIATION is on record in favor of establishing a second monthly publication designed to interest and serve the retail pharmacist. This matter has had very careful consideration in the Council and it is believed that the interests of the ASSOCIATION will be served best if the present JOURNAL is gradually converted into an exclusively scientific publication carrying the monthly abstracts of pharmaceutical literature, papers of sufficient scientific value to warrant giving them a permanent place in the literature and editorials relating to the development of professional pharmacy. American pharmacy needs such a publication. The general information now carried in the JOURNAL, together with articles of special interest to pharmacists operating retail establishments or prescription shops and editorials relating to the general objectives of the ASSOCIATION and defining its policies would be published in the new JOURNAL. Thus the ASSOCIATION would fill a long-felt need in bringing its activities closer to the average retailer.

With the publication of the 1934 YEAR BOOK this series of volumes reporting the progress of pharmacy will come to an end in accordance with the action taken by the ASSOCIATION some time ago. In place of the annual publication of abstracts in the YEAR BOOK, monthly instalments of these abstracts will appear in the JOURNAL. This improved service to the members of the ASSOCIATION has been in effect since March of this year. Editor DuMez and his collaborators are to be commended for the promptness with which abstracts of pharmacutical literature are now reaching us, and Editor Eberle has made arrangements to segregate the abstracts in the JOURNAL in such a manner as to make them available for separate binding at the end of the year if that is desired. Many of us will miss the annual YEAR BOOKS even as many others of a previous generation missed the annual volume of Proceedings, but the needs of the day are such as to require prompt publication of proceedings, abstracts and other material, and to this end monthly publication is much more serviceable. Further reference to the publication program will be made in another part of this address.

PRACTICAL TRAINING

Our fourth objective bearing upon proper conditions of apprenticeship and employment so as to prevent the evils flowing from deficient training in responsible duties in preparing and selling medicine is, at this time, of deep concern to the profession. The advent of the four-year course in pharmacy has focused attention upon the necessity for the revision of the practical experience requirement. I do not intend to recommend any specific method of providing the practical training which all pharmacists need before entering upon their profession. Nor do I intend to condemn any method which has been proposed for providing necessary practical training in advance of a trial of the method. I believe that practicing pharmacists have a certain responsibility in connection with the matter. Colleges of Pharmacy are concerned in so far as the coordination of their courses with the practical experience requirement is essential. The problem is of chief concern to the Boards of Pharmacy which are responsible to the public. It is to be hoped that the Boards will rise to their responsibility in this and other matters. We have in the United States, forty-eight states which are also forty-eight laboratories in which we should be permitted to do some experimenting. To arbitrarily attempt to stifle the initiative of any state in this matter is not rendering a service to pharmacy. Fortunately, we have Boards of Pharmacy which are willing to do pioneer work in this field. They should be encouraged in their attempt to find solutions to our problems.

DRUG DISPENSING RESTRICTED TO PHARMACISTS

Our fifth objective refers to restriction of the dispensing and sale of medicines to pharmacists. We have made many attempts by legislation to attain this objective. In spite of the fact that it is entirely logical, and in the interest of the public health and welfare, to require that all drugs and medicine shall be dispensed under the supervision of registered pharmacists, we have not been able in eighty-three years to come as close to this objective as the public interest demands. The tendency on the part of pharmacists, is to condemn legislators for failure to so revise pharmaceutical laws as to give the public this necessary protection. The fact

is that the members of our own industry are probably more responsible for our failure to reach this objective. I am not basing this statement on guess-work. It is perfectly apparent to anyone who has had legislative experience that manufacturing interests invariably block state legislation which tends to restrict the sale of drugs and medicines to registered pharmacists.

At the 1934 meeting of the National Drug Trade Conference, I presented a resolution asking the conference to go on record in favor of restricting the sale of drugs to drug stores. The resolution was referred to a committee consisting of one member from each of the eight associations participating in this meeting. They represented the three drug manufacturing associations, one wholesale association, our ASSOCIATION, the National Association of Retail Druggists and the association of colleges and association of boards. The committee voted five to three in favor of the resolution. The three negative votes were cast by the three associations of manufacturers. Undoubtedly, there are among the better class of drug manufacturers, some who would be willing to see their products marketed exclusively through the drug store. However, as a class they do not desire to restrict distribution of their products to registered pharmacists. How can we expect legislators and laymen to support the principle that all drugs should be supplied under the supervision of registered pharmacists if members of the drug industry are opposed to such a procedure? It is necessary for us as the professional association of pharmacy to educate members of our own industry on this question. With the increasing amount of radio and magazine advertising of packaged drugs, it is not difficult to visualize the possibility that pharmacists may be eliminated as important factors in the distribution of drugs and medicines. That may not be the immediate objective of drug manufacturers, but it is conceivable that if their volume of sales can be increased through other channels of distribution, some of them will not hesitate to use these channels to a greater degree and others will follow if the plan is successful. The medical profession is just as deeply concerned in this situation as we are. It is not a far cry from general distribution of drugs and medicines through non-professional outlets, by means of modern advertising facilities to the diagnosis and treatment of disease by the same methods. As a matter of fact, it has been done and is being done. In self defense as well as in the public interest, the professions should endeavor to curb this trend.

PHARMACEUTICAL EDUCATION AND PRACTICE

Our sixth objective has to do with upholding standards of education and standards of pharmaceutical practice. We have made rapid though belated strides in the improvement of the education of pharmacists. The delay has unquestionably been due to lack of interest and initiative of pharmacists themselves in improving their system of formal education. The American Medical Association realized much earlier than did we, the necessity for a high standard of culture and professional attainment in order to maintain the dignity and leading position which medical men occupy. The AMERICAN PHARMACEUTICAL ASSOCIATION, as an association, has not taken the direct interest in promoting higher educational standards for pharmacists which it rightfully should have taken in its position as spokesman for American Pharmacy. It is somewhat late to offer a program now. However, it is not too

late to express complete approval of the present trend in pharmaceutical education toward a cultural background for the necessary technical training required of prospective pharmacists and to urge adherence to the four-year course as a minimum requirement for undergraduate study. It is also important to emphasize that leadership in pharmaceutical education should be retained by pharmacists. The American Association of Colleges of Pharmacy was organized to promote the interests of pharmaceutical education but it is composed only of faculties connected with institutions that teach pharmacy. It is an organization which serves the profession in a specialized field. It does not and cannot speak for American pharmacy as a whole. Its function is to provide for the proper administration and teaching of pharmacy courses. In this function it should have the active support of the AMERICAN PHARMACEUTICAL ASSOCIATION and beyond this, it is certainly the duty of the AMERICAN PHARMACEUTICAL ASSOCIATION to see that the colleges of pharmacy of the United States meet an adequate standard, that they are adequately financed, and that they limit their output to the number which can be absorbed by the industry and the profession.

In addition to this responsibility, the AMERICAN PHARMACEUTICAL ASSOCIATION should assume some responsibility for the continuance of the education of those who are actively engaged in the practice of pharmacy. This can be done by planning for extension courses in cooperation with schools of pharmacy and schools of medicine. A start in this direction should be made even if the response, at first, is not too gratifying.

The proposal to organize a Council on Pharmaceutical Practice under the ægis of the AMERICAN PHARMACEUTICAL ASSOCIATION has been approved and a committee headed by Professor Cook has been actively engaged in formulating plans for setting up such a Council. Time has been set aside at one of our general sessions for the presentation of the report of this Committee and a discussion of its plans. It should be understood that the AMERICAN PHARMACEUTICAL ASSOCIATION is not arbitrarily setting itself up as an agency to classify pharmacies or drug stores. However, it is taking cognizance of the fact that pharmaceutical practice may be supplied with varying degrees of expertness and efficiency. It is, therefore, supporting a plan designed to set up minimum standards of acceptable practice for pharmaceutical work in manufacturing plants, in hospitals, in prescription pharmacies and in various governmental or private institutions. In order that the public may benefit to the fullest extent from such plans it seems desirable to indicate in some manner who is qualified to render the specialized services for which minimum standards are to be set. It is recognized that a certificate to practice a profession issued by a commonwealth does not necessarily indicate great proficiency on the part of the holder of the certificate. It is at best merely a protection against gross incompetence by guaranteeing that the licensee has met certain minimum standards and passed a prescribed test of fitness which does not always measure fitness satisfactorily. Hence it seems desirable to follow the trend in medicine, which is now so pronounced, of creating boards of experts in given fields, which examine the qualifications of those who desire to practice as specialists and certify that they are really qualified by training and experience to act as such.

Our seventh objective refers to the code of ethics and need not be commented on here for it is well known to pharmacists everywhere. It may not be out of

place to suggest that Boards of Pharmacy require newly registered pharmacists to sign this code of ethics as a part of the registration requirement as is done in New Jersey

MEMBERSHIP PROBLEMS AND PLANS

You heard in the report of Secretary Kelly to the House of Delegates yesterday, that our active personal membership numbers only about three thousand. In spite of a lack of personal participation in its activities, the pharmacists of the United States have looked up to the AMERICAN PHARMACEUTICAL ASSOCIATION as the personification of everything they would like pharmacy to represent in its highest and most professional sense. Practically all of them are ready to point with pride to what the AMERICAN PHARMACEUTICAL ASSOCIATION represents. This was true before there was a building in Washington, before there was a full-time Secretary and even before the organization embarked on the venture of publishing a monthly journal. It was one of those things that is just taken for granted. In other words, the AMERICAN PHARMACEUTICAL ASSOCIATION has for more than four score years been a symbol in the minds of the average pharmacists who never expected to get very close to the ASSOCIATION and who were never directly approached by the ASSOCIATION, but who nevertheless sensed the lofty purposes which prompted its organization and have benefited by the activities of individuals affiliated with the ASSOCIATION and acting for the ASSOCIATION on occasions when professional pharmacy was called upon to take part in national affairs having to do with the compounding and dispensing of medicines or the rendering of services commonly described as pharmaceutical. But I raise the question, "Shall the AMERICAN PHARMACEUTICAL ASSOCIATION remain a symbol or shall it become a living thing to all pharmacists?" I am convinced after an experience of nearly twenty-five years, that American Pharmacy needs concerted national direction more than it needs anything else to-day. It is my further conviction that it is absolutely unnecessary to go outside of existing set-ups to provide this concerted action and national leadership. In fact it has been definitely shown that such organizations as the National Drug Trade Conference and the Drug Institute which were organized to provide for the expression of a composite view on behalf of all elements in the drug industry, have failed to accomplish that purpose. I believe that the only way in which the divergent interests of the various elements of the drug industry can be harmonized to the extent required on questions of professional and trade interest is by the meeting of representatives of those elements on the same level and that means meeting as pharmacists with the welfare of pharmacy in mind. When we meet as pharmacists, we have something in common. When we send our attorneys to meet each other, it is notice to the world that we are endeavoring to obtain the best deal possible for our private interests. Let us solve the problems of American Pharmacy by meeting as pharmacists in the AMERICAN PHARMACEUTICAL ASSOCIATION. There are some who would profit by retaining the American Pharmaceutical Association as a symbol and building it up as a professional veneer for the drug industry. We must guard against any such eventuality.

In an address last January,¹ I covered the membership problem in detail and I desire to quote the following from this address

¹ *Druggists Circular* January 1935 page 28

"The AMERICAN PHARMACEUTICAL ASSOCIATION is the all-inclusive organization of pharmacists. It can include in its membership every member of the manufacturing, wholesale, retail, teaching and law enforcement associations. Using the state associations as a basis, it can include every retail pharmacist affiliated with such associations. It is fortunate that such an all-inclusive membership is possible to-day without upsetting or injuring any other national association. By the simple expedient of bringing every state association member into the fold of the AMERICAN PHARMACEUTICAL ASSOCIATION and the National Association of Retail Druggists through the payment of one fee for membership in the state associations, and by the medium of a small per capita tax collected from other national associations, a majority of the retail, wholesale and manufacturing groups can be brought into the AMERICAN PHARMACEUTICAL ASSOCIATION and make it the spokesman for American Pharmacy on matters of general professional and economic concern. The membership fee under such an arrangement will be nominal. The publications of the ASSOCIATION, with so wide a distribution of readers, will bring in revenue, and there will be an end to the demand for new associations and the solicitation of funds with which to do what we should now be doing. Furthermore—and this is of the greatest importance—when the ASSOCIATION becomes representative of the majority of practicing pharmacists, its power of moral suasion will be great enough to make many demands for laws to control trade practices unnecessary. We can only have industrial and professional self-government when we represent the profession and the industry by the consent of the majority.

"If we are ever to adjust the output of pharmacists to normal demands, if we are ever to obtain satisfactory legislation for the control of the quality and sale of drugs and medicines, and if we are ever to establish uniform requirements for licensure and improve the professional and economic status of the pharmacist, we must operate as a unit. With a majority of pharmacists in the various branches of the profession united through membership in the AMERICAN PHARMACEUTICAL ASSOCIATION, our Code of Ethics will take on a new significance. Membership in the AMERICAN PHARMACEUTICAL ASSOCIATION will be a badge of distinction to be taken from anyone who fails to live up to the Code of Ethics and the principles of Fair Play.

"To take care of the present membership, which is, to a degree selective, there may be organized within the ASSOCIATION a body to be known as the 'American Institute of Pharmacy,' the members of which would be designated as 'Fellows.' In this way a new significance would be given to the title 'American Institute of Pharmacy,' which is now nothing more than the name on a building belonging to the AMERICAN PHARMACEUTICAL ASSOCIATION. To become a Fellow of the American Institute of Pharmacy one would first have to be a member of the AMERICAN PHARMACEUTICAL ASSOCIATION for a period of years to be determined, and he would have to present qualifications entitling him to fellowship. We have the same arrangement in the American Association for the Advancement of Science and the American Public Health Association. It is to be expected that fellowship dues will be higher than membership dues in the AMERICAN PHARMACEUTICAL ASSOCIATION. The Fellows of the American Institute of Pharmacy by virtue of their membership will be recognized as outstanding individuals in their field. They may have specialized in prescription practice, in teaching, in law enforcement work, in manufac-

turing pharmacy or in research. This will assure the presence within the AMERICAN PHARMACEUTICAL ASSOCIATION of a group of highly qualified pharmacists to whom should be assigned committee appointments and the elective offices of the ASSOCIATION. Since any pharmacist who is able to qualify as an expert in some phase of pharmaceutical practice would be eligible to fellowship in the Institute, no unjust discrimination can be charged, and representation of the ASSOCIATION by highly qualified individuals will be assured."

It is advisable to await action of the Joint Committee on cooperation of the AMERICAN PHARMACEUTICAL ASSOCIATION and National Association of Retail Druggists with State Associations and the launching of our new JOURNAL before taking any definite action on this plan. My recommendations on the subject are made with this development in mind.

REORGANIZATION OF THE COUNCIL

The Council of the ASSOCIATION is the executive body and, under present conditions is more responsible for the activities of the ASSOCIATION than any individual officer. It is now composed of seventeen members, nine of which are elected by members of the ASSOCIATION. The balance are officers of the ASSOCIATION. This is an unwieldy body for the transaction of business either personally or by mail. Some years ago we substituted for the Council, a board of directors composed of nine members. This was a much more satisfactory group and the only reason for changing back to the larger number was to satisfy an apparent requirement of the Charter of the ASSOCIATION. I have studied the Charter and I see nothing in its wording which would require the Council to consist of seventeen members. I recommend that the By-Laws be amended to reduce membership of the Council to six elected members and three ex-officio members, namely, the president, the president-elect and the chairman of the House of Delegates. The six elected members should be distributed geographically in accordance with the concentration of membership. The Council should have its own secretary and should be required to meet at least three times a year, one meeting to be held in connection with the annual Convention, one meeting in the fall of the year, and one meeting in the spring. It should be required that the permanent officers of the ASSOCIATION make quarterly reports to the Council and it would be expected, of course, that the Secretary of the ASSOCIATION and such other officers as the Council deems necessary, be asked to attend the meetings which should all be held at the headquarters building in Washington.

The recommendation that the Council should be small is in line with good administration as followed by other efficient national organizations. The provision that the Council should have its own secretary is likewise in line with good administration and goes back to the policy formerly followed by this ASSOCIATION. It seems that when we decided to elect a full-time secretary, we were afraid that he would not have enough to occupy his time, so we made him Secretary of the ASSOCIATION with the work incident thereto at the general sessions of the Convention, we then made him Secretary of the House of Delegates with the tremendous amount of detail that entails at the annual convention and then we topped it off by making him Secretary of the Council so as to be sure that he would have no spare moments, either night or day, during the Convention week. I believe that when we expect our permanent secretary to act at the general sessions, and as Secretary to the House of Delegates,

we have given him more than enough of a load to carry at these Conventions The duties of the Secretary of the Council would not be sufficiently arduous at any time to call for anything more than nominal expense for clerical help and other services

ACTIVITIES OF STANDING AND SPECIAL COMMITTEES

The standing and special committees of the ASSOCIATION have been active in their various spheres and will have some very interesting reports to make I wish that I could take the time to give a more detailed résumé of the work of all Committees for it represents a true picture of the many and varied activities in which our ASSOCIATION is engaged However, a mere reference to the more important activities must suffice at this time New members and those who have not followed the work of the AMERICAN PHARMACEUTICAL ASSOCIATION very carefully in recent years will be amazed at the scope and variety of activities covered if they will look over the titles of the many committees we have at work and read the valuable information contained in their annual reports The following brief comment on Committee activities may be of interest at this time The Committee on Local Branches, under Dean Ziesle, has made a very careful survey of the Local Branch situation and will have some recommendations to make I asked the Local Branches to communicate with me at the end of their fiscal year, setting forth a review of their activities and supplying information about their programs which might be helpful to the future plans of other branches The response to this request was very gratifying and this information has been turned over to the committee There seems to be a very live interest in some of our schools of pharmacy in the Student Branches I hope that this interest can be fostered I believe that some arrangement should be made to rebate a small portion of the annual dues of members of the AMERICAN PHARMACEUTICAL ASSOCIATION who are members of Local Branches, to the Local Branches This would aid the collection of dues for both the parent organization and the branches

The Committee on Pharmaceutical Research headed by Dr Army has continued its activities in promoting and supplying financial assistance for outstanding research projects

The Committee on Proprietary Medicines has not been very active in recent years It could render a very useful service to the profession by organizing a service for pharmacists which would make available information with regard to the composition, standards, classification and ethical status of proprietary medicines Certainly retail pharmacists should have as much information about proprietary preparations as is now furnished by organizations serving various groups of consumers While it is not the function of pharmacists to diagnose or treat disease, they are expected to have full information about the drugs and medicines which they are called upon to dispense With an authentic source of information on this subject available, the professional status of the pharmacist will be enhanced and service to the public will be greatly augmented

A similar service can be rendered the pharmacist in connection with cosmetics Here is a virgin field There is no Council on Cosmetic Preparations serving in the capacity of the Council on Pharmacy and Chemistry or the Council on Dental Therapeutics Our Committee on Cosmetics has this matter in mind and could render a splendid service to the pharmacists of the United States as well as the

public by arranging for the collection and distribution of information on the composition and claims made for cosmetic products

The Committee on the Study of Pharmacy has made a number of contacts with foundations interested in education and in the problems of medical care. It is often stated that a complete survey of pharmacy and the activities of pharmacists is necessary in order to supply the background for departures from existing methods of supplying drugs and medicines. The fact is that a number of excellent surveys have been made and are available in published form. The Charters' Report, the Reports of the Committee on the Costs of Medical Care, the St. Louis Survey and other surveys of the Department of Commerce are all replete with facts and figures concerning the practice of pharmacy and in some instances these reports contain recommendations for the improvement and enlargement of pharmaceutical activities which, if carried out, would be of considerable assistance in placing the practice of pharmacy upon a more satisfactory basis. We should make greater use of information contained in these surveys. At the same time, a complete study of the present situation will undoubtedly prove most helpful at this time and the Committee on the Study of Pharmacy should continue its efforts in this direction.

The Committee on U. S. Pharmacopœia, under the chairmanship of Professor Glover, has been somewhat regenerated during the past year. It is a standing committee of the ASSOCIATION and its functions are to collect statistics regarding the frequency with which official and non-official remedies are used in legitimate practice and to ascertain the general wishes and requirements of the profession throughout the country in regard to any desired changes or improvements in the Pharmacopœia. It has other duties but the foregoing are of paramount importance, particularly in view of the coming revision of the U. S. Pharmacopœia. It seems advisable that membership on this Committee should be restricted to those who are not also members of the U. S. P. Revision Committee.

The Committee on Prescription Tolerances, headed by Dr. Schaefer, has done very valuable work in determining the limits of possible accuracy in the extemporaneous compounding of prescriptions. It is very essential that this work be continued and extended.

The Committee on Weights and Measures, under the chairmanship of President-Elect Costello, has continued to assemble information on the accuracy of weighing and measuring devices in retail drug stores, and in this connection it is pertinent to point out that in states where strict supervision over weights and measures is maintained, the apparatus and equipment are found to be in good condition.

The Committee on Physiological Testing, under the chairmanship of Dr. Munch, has continued its work on the deterioration of digitals, and in the course of time the experiments reported by this Committee over a period of years should prove of considerable value in estimating the rate of deterioration of biologically assayed drugs.

The Committee on Pharmacy Corps in the U. S. Army, under the chairmanship of Dean Knedig, has energetically pursued the objective of the ASSOCIATION to secure commissioned rank for pharmacists in the Army. The report of this Committee will show that considerable progress has been made. Several conferences were held with Surgeon General Patterson and members of his staff during the past year,

and on one occasion the pharmacies at two Army posts were visited. It appears quite certain that in the near future suitable commissioned rank will be provided for pharmacists whose education has been of the same character as that of other professional groups now enjoying commissioned rank in the Army.

The Committee on Horticultural Nomenclature under the chairmanship of Professor Youngken has been active in making classifications which will assist in the identification of various drug plants.

The Committees on Legislation, Pharmacy Week, Press Relations, Transportation and Code Matters have all functioned in their respective fields and some of their work has already been referred to in other parts of this address.

The Committees on Pharmaceutical Syllabus, International Pharmaceutical Nomenclature and Prerequisite Legislation have likewise functioned in their respective fields, although in the majority of instances their principal activities have been completed for the time being.

The Maintenance Committee for the Headquarters Building has obtained a number of new subscriptions to the Building Fund, and subscriptions totaling \$132,036.00 to the Maintenance Fund. Of the latter amount \$50,000.00 represents a bequest to be paid at a later date, and of the remaining \$82,036.00, the sum of \$64,436.00 has been paid. This has enabled the Association to complete payment of all indebtedness on the building and property with the exception of a mortgage of \$36,400.00 on the lot in the rear of the building, which is amply covered by the bequest of \$50,000.00 previously mentioned. The building has recently been exempted from taxes because of the educational and non-profit nature of the activities carried on by the Association.

A variety of gifts have been made to the headquarters building in addition to the contributions toward the Maintenance Fund, and these are covered in detail in the report of Chairman Dunning of the Maintenance Committee. Our continued thanks are due Chairman Dunning for his untiring efforts in this connection.

The Committee on William Procter Jr. Memorial Fund under Chairman Hancock has made excellent progress toward the preparation and erection of the monument in the headquarters building, and we may look forward to the dedication of the monument in the near future.

Dr. John C. Krantz and Professor Gustave Bachman are to be congratulated on the fine program which they arranged in behalf of Pharmacy at the recent meeting of the American Association for the Advancement of Science. The establishment of a section devoted to pharmacy within this national association is an indication of the progress scientific pharmacy is making.

During the past year we have also had at work Committees on State and National Code Matters, on the Study of Pharmacy Laws and on the Drafting of an Act to Restrict Distribution of Drugs and Medicines to Pharmacists. The latter two Committees should be continued and encouraged in their efforts toward finding a solution for some of the most perplexing problems relating to pharmacy law enforcement. They are headed by Dr. Robert L. Swan and Mr. W. Bruce Philip, respectively. In making a study of Pharmacy laws it has seemed to me to be advisable to enlist the cooperation of the American Bar Association and its Commission on uniform State laws. I am pleased to be able to report that correspondence with

the officers of the Bar Association indicates an interest in our problem of seeking greater uniformity in State pharmacy laws. It is suggested that the Committee correspond further with the American Bar Association.

The Committee on National Formulary and the Committee on Recipe Book have both been busily engaged in the revisions of these respective volumes. Dr Lascoff as chairman of the Committee on Recipe Book, with the assistance of Mrs Elsie Kassner, who was selected as editor, and the other members of the Committee, has practically completed the revision of the Recipe Book, and I feel sure that the second edition of this important and valuable volume will meet with general approval. The new edition of the National Formulary is nearing completion and will be an outstanding work in its particular field.

I cannot allow the opportunity to pass without paying a tribute to the diligence and effective work of the committee which is revising the National Formulary. Professor Gathercoal has brought to the chairmanship of the committee a type of leadership in which American Pharmacy and the AMERICAN PHARMACEUTICAL ASSOCIATION can take just pride. His sane approach to the problems of the revision, the scientific thoroughness which has characterized the preparation of the monographs and withal the great patience and willingness to seek and accept advice which have been displayed throughout the revision, call for our most profound admiration and thanks.

To Editor Eberle, I wish to express my thanks for cooperation extended throughout the year.

To Dr Kelly whose very difficult and trying position as Secretary of an ASSOCIATION, which is endeavoring to be helpful to the divergent interests within the drug industry, requires great patience, tact and capacity, and who possesses all these attributes to an unusual degree, I likewise desire to express my gratitude. We have not always agreed on methods but I doubt whether there has ever been a disagreement between us as to the position which the AMERICAN PHARMACEUTICAL ASSOCIATION should take on matters of fundamental importance. As officers of the ASSOCIATION, we have had to place our own interpretation on matters regarding which the ASSOCIATION and Council failed to give definite instructions. There has been no difficulty in harmonizing our views or stating our respective positions on such matters because they were approached with the interests of American Pharmacy and the AMERICAN PHARMACEUTICAL ASSOCIATION at heart. Such recommendations as I have made with respect to the secretaryship are intended to clarify and assert an association policy on the subject and to give to the office that responsibility which the proper exercise of its duties demand.

To all others whose advice, counsel and cooperation I have had throughout the year, I express my sincere appreciation and thanks, and finally, I thank the members of the ASSOCIATION for the opportunity that has been given me to serve in this high office.

RECOMMENDATIONS

Recommendation No 1—It is recommended that it shall be the policy of the AMERICAN PHARMACEUTICAL ASSOCIATION to require its full time officers to confine their pharmaceutical activities to the affairs of the ASSOCIATION. This is not to be interpreted as an abridgment of the privilege to take part in related affairs in the capacity of advisor, committeeman or delegate.

It is, however, to be interpreted as abridging the privilege of serving in a secretarial or managerial capacity to any other organization or group or to act as the spokesman or representative of any other organization or group within the sphere of pharmaceutical activity unless permission to do so is specifically granted by the Council

Recommendation No 2—It is recommended that the secretary of the ASSOCIATION be also designated as general manager and that this title shall carry with it executive supervision of and responsibility for the activities of the ASSOCIATION in the headquarters building

Recommendation No 3—It is recommended that it shall be the policy of the AMERICAN PHARMACEUTICAL ASSOCIATION to work actively toward a unification of pharmacal forces within the United States and that the immediate steps to be taken in this direction shall be the fostering of an intimate contact with the State Pharmaceutical Associations and with the National Association of Retail Druggists to the end that membership in state Pharmaceutical Associations shall eventually carry with it a personal affiliation of every State Association member with the A P H A and the N A R D

Recommendation No 4—It is recommended that it shall be the policy of the AMERICAN PHARMACEUTICAL ASSOCIATION to assume active responsibility for the general direction of pharmaceutical affairs in the United States This is not to be interpreted as an effort to duplicate the activities of any organization now functioning in a specific field such as education, licensure manufacturing wholesaling or retailing It is however, to be interpreted as an offer of cooperation from the representatives of the profession at large with respect to the formulation of policies affecting pharmacy as a whole and as an expression of the intent to assume leadership in those matters which are national in their scope and which affect the relations of pharmacists to other professions the relations of pharmacists to each other and the relations of pharmacists to the public

Recommendation No 5—It is recommended that the president elect be made an ex officio member of the Council immediately following his election and that the procedure at the annual convention be so arranged as to give the president elect an opportunity to submit recommendations in time for approval at the meeting at which he takes office

Recommendation No 6—It is recommended that the office of Librarian and Curator of the Museum be created as soon as possible as a full time office

Recommendation No 7—It is recommended that the contents of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION be confined to scientific and professional papers of permanent value or significance, to the monthly abstracts of pharmaceutical literature and to editorials dealing with scientific and professional matters It is further recommended that as soon as this change can be brought about, the material of general interest now appearing in the JOURNAL together with helpful papers and articles on professional and economic subjects be issued in the form of a new monthly publication directed particularly to the retail pharmacists of the United States It is further recommended that this publication carry no advertising

Recommendation No 8—It is recommended that the new Journal referred to in the preceding recommendation be mailed to the members of all State Pharmaceutical Associations upon payment of a small per capita tax by the respective State Associations and that it be issued with the cooperation of the N A R D if the plans for unification and coordination of the activities of State Associations and the two National Associations now under discussion are consummated

Recommendation No 9—It is recommended that the cooperation of the AMERICAN PHARMACEUTICAL ASSOCIATION be extended to Boards of Pharmacy in their efforts to establish adequate standards for the practical training of pharmacists especially in cases where departures from established customs are contemplated and that the results of any survey or study which the ASSOCIATION may make in connection with the formulation of standards for practical experience, be made available to the Boards

Recommendation No 10—It is recommended that the dangers of the distribution of drugs and medicines without the supervision of pharmacists be called to the attention of the American Medical Association and Medical Societies of various states with the request that they join the AMERICAN PHARMACEUTICAL ASSOCIATION in an aggressive effort to persuade drug manufacturers to limit distribution of their drug products to registered pharmacists

Recommendation No 11—It is recommended that the Council on Pharmaceutical Practice give consideration to certification of specialists in the fields of hospital pharmacy manufacturing

pharmacy and prescription pharmacy, by the establishment of boards of experts for such certification

Recommendation No 12—It is recommended that the committee on study of pharmacy be instructed to explore the possibilities of extension courses for practicing pharmacists to the end that formal lectures and demonstrations in connection with newer materia medica may be arranged at suitable points and that such instruction be confined to fundamental scientific progress in the field rather than to commercial preparations

Recommendation No 13—It is recommended that the By-Laws be amended to reduce membership of the council to six elected members and three ex officio members namely the president, the president elect and the chairman of the House of Delegates The six elected members should be distributed geographically in accordance with the concentration of membership

Recommendation No 14—It is recommended that the Council be authorized to take such steps as may be necessary to obtain the best legal opinion on the status of the National Formulary as a legal standard under the Food and Drug Act and that such changes as may be required in the manner of selecting the Revision Committee in order to obtain Congressional authorization for the revision and publication of the National Formulary, be inaugurated as soon as possible It is further recommended that the U S P Revision Convention be urged to take similar steps with respect to the U S P

Recommendation No 15—It is recommended that the Committee on Proprietary Medicines be requested to study the possibilities of organizing an informational service to the profession with regard to the composition standards, classification and ethical status of proprietary medicines and report its recommendations to the Council for action at an early date

Recommendation No 16—It is recommended that the Committee on Cosmetics be requested to give immediate attention to the possibility of organizing a Council on Cosmetic Preparations with functions similar to the Council on Pharmacy and Chemistry of the A M A and the Council on Dental Therapeutics of the A D A so that necessary information on the composition and claims made for cosmetics may become available to pharmacists and proper standards be devised for the protection of the public in the commerce in these commodities

Recommendation No 17—It is recommended that the Council give immediate attention to the possibility of making available from the permanent funds accumulated interest, or other sources, a sufficient sum of money to launch some of the activities to which this ASSOCIATION is committed In launching these activities, preference should be given to the ones which appear to promise the most immediate return of the financial outlay required in their inauguration Activities which seem to require immediate attention are revision of the publication program, membership campaigns, Council on Pharmaceutical Practice

INTERNATIONAL PHARMACEUTICAL FEDERATION

The ninth general assembly of the International Pharmaceutical Federation was held on Monday, July 29th, in the rooms of the Nationale Pharmaceutique Brussels This is the second meeting of the Federation to be held in Brussels since the foundation in 1912 The President of the Federation (Dr J J Hofman The Hague) presided over an attendance of about fifty members, including Professor Dr L van Italle (*president d'honneur*), M G Barthet, M O von Koritsanszky E Saville Peck and Dr E Host Madsen (*vice-president*), Professor Dr H Baggesgaard Rasmussen and Dean Burbidge of Nova Scotia

THE PAN AMERICAN MEDICAL ASSOCIATION

On August 2nd, the Pan American Medical Association completed its sixth cruise to South America The itinerary included brief visits to Nassau Jamaica and Curacao more extended visits to Rio de Janeiro and São Paulo, and again brief visits to Trinidad Puerto Rico and Bermuda The visit of more than a hundred American physicians to our South American neighbors must result in benefit to international relations and acquaint the South American countries more fully with the medicine of the United States Moreover, opportunity was given to the American visitors to obtain an insight into the medical institutions and to some extent into the nature of practice of the countries visited—*Jour A M A*

ADDRESS OF THE CHAIRMAN OF THE HOUSE OF DELEGATES

BY ROWLAND JONES

Ladies and Gentlemen of the House of Delegates

We are met here in the great Northwest, for the eighty-third annual convention of our ASSOCIATION. The eighty-third year in the life of the AMERICAN PHARMACEUTICAL ASSOCIATION just closed has been eventful. It seems that as the age of our organization increases, our problems increase in more than direct ratio. Organization for mutual effort is fast becoming one of the salient characteristics of the age in which we are living. We should be grateful that this ASSOCIATION continues to meet these problems, as in the past, in an honest and sincere manner and without any of the compromises which are the burdens of other professional organizations. I know of no organization of like kind in the country which is blessed with such a group of unselfish workers, often laboring in comparative obscurity, who only ask the opportunity to serve. It is this spirit, which I believe is unique, that has made this ASSOCIATION great and obtained for our profession the long list of major accomplishments of which we are all so proud.

ROWLAND JONES

The House of Delegates is representative of every interest in pharmacy. Its machinery is simple and direct in action. Every part of the nation has a place among its delegates. It offers to the state associations a national forum to which they may bring their problems and their successes. But I feel that the House of Delegates has not been used to the full extent of its possibilities and I invite the attention of the members to this fact. Ways and means should be formulated through which we may utilize the full potentialities of this body.

It has been my privilege during the past year to live in close proximity to the AMERICAN INSTITUTE OF PHARMACY, that marvelous monument to our profession which this ASSOCIATION now calls home. It is with pleasure that I take this opportunity to tell the members of this House how fortunate you are to have the services of E. F. Kelly and E. G. Eberle. I have had the privilege and pleasure of working closely with them during the past year. Their unceasing labor and outstanding devotion to this ASSOCIATION is inspiring to see. With such men as this in charge of the business of our ASSOCIATION, the future can never be in doubt.

In tracing the history of the past year, it is probable that it would be difficult for us to agree upon what the outstanding development in pharmacy has been. To my mind it has been the stipulation by Federal and State Relief agencies that prescriptions, paid for with public funds, shall call for U. S. P. and N. F. preparations whenever possible. As far as I know, this regulation has been in effect in every state and it is my experience that it has been generally complied with. I believe that this policy has brought our official compendiums to the attention of the

medical profession as never before and in a manner impossible by the usual methods of publicity and education. In my opinion, the salutary effect upon pharmacy has been enormous and we will feel it for a long time to come. I do not know who is responsible for the policy, but whoever he or they may be, we owe them our deepest gratitude.

During the past year, we have seen additional states join the ranks of the great number having adequate prerequisite laws. We are just beginning to feel the effects of this great change which we have accomplished in such a remarkably short time and I predict that during the next few years we will realize the results of which we have dreamed.

I invite you all to visit at the earliest opportunity one of our colleges of pharmacy, if you have not done so recently. Examine the plant, acquaint yourself with the members of the faculty, but above all observe the quality of the student body. The men and women now graduating from our colleges will give you a real thrill. These young men and women are the hope of our profession. As their number in active practice increases, many of our ills will disappear. The average income of the practicing pharmacist will increase to somewhere near the level commensurate with his educational investment.

But these happy developments may bring another serious problem. I fear, unless economic conditions affecting retail pharmacy are not soon improved, that we will face a growing demand for a relaxation of present prerequisite requirements. Should this happen, we will find ourselves in a vulnerable legislative position. The annual graduation roll from our colleges has been drastically reduced. A scarcity of pharmacists with the increased remuneration which they will be sure to demand will strengthen the demand for a retrogression in standard of education in pharmacy unless competitive conditions improve or if they become worse as is a distinct possibility at this time. While the AMERICAN PHARMACEUTICAL ASSOCIATION has never been particularly active along commercial lines, and I think justly so, in the past at least, we may be forced to enter that field, in active competition with the other national body, in order to protect what I believe to be this ASSOCIATION's greatest accomplishment, the 4-year law. Present profit and loss statements of the average retail drug store indicates that an increased salary budget cannot be maintained with financial safety. A return to educational standards of twenty years ago would be a bitter pill to swallow. We simply cannot allow it to happen. No sacrifice would be too great if necessary to prevent it. I urge your earnest consideration of this very possible future trend of events.

Just a word about NRA and the codes. I deeply regret that the court decision invalidating that whole effort came just at the time when the loss limitation provision had begun to demonstrate its possibilities. However, I believe that the whole code effort has been worth all it has cost, that even to day we are feeling benefits from the lessons learned in that experience. Secretary Kelly's work on the National Code Authority was outstanding and invaluable and commercial pharmacy is indebted to the AMERICAN PHARMACEUTICAL ASSOCIATION for his services.

A great deal has been written of late about the multiplicity of pharmaceutical organization in this country, and the desirability of some method of consolidation of membership. Plans have been suggested but no one of them has been generally well received. While I feel that a physical consolidation of the AMERICAN PHAR-

MACCEUTICAL ASSOCIATION and the National Association of Retail Druggists is neither desirable or possible, I am of the opinion that some mutually advantageous method of joint dues and membership can be found and recommend that further joint study of the matter be made

All of us in attendanec at this convention are familiar with the long list of accomplishments of this ASSOCIATION which have improved the status of the profession of pharmacy and have thus vitally affected every pharmacist in every state But I am of the definite opinion that far too many of the pharmacists of this country do not realize the extent of the benefits which have come to them as a direct result of the work of this ASSOCIATION This is, because they have not been told about them Modesty is to be admired but I feel that this ASSOCIATION has carried modesty a little too far for the good of the organization I believe that efforts to bring the things that have been done and that are now in the process of fulfilment, to the attention of the average pharmacist might profitably be made without loss of dignity or prestige I am not so sure but that the AMERICAN PHARMACEUTICAL ASSOCIATION has been hiding its light under a bushel, to some extent at least

The President and Vice-Presidents of the AMERICAN PHARMACEUTICAL ASSOCIATION
1935-1936

The officers of the House of Delegates for 1935-1936 are *Chairman*, Roy B Cook Charleston, W Va , *Vice Chairman*, C Thurston Gilbert, Noroton, Conn , *Secretary* E F Kelly 2215 Constitution Ave , Washington, D C

ADDRESS OF THE PRESIDENT OF THE AMERICAN ASSOCIATION
OF COLLEGES OF PHARMACY

BY ERNEST LITTLE

Mr Chairman, Fellow-Members, and Guests

I know that I reflect the sentiment of my Eastern and Mid-Western associates when I say that we consider it a privilege to hold our thirty-sixth annual meeting of the American Association of Colleges of Pharmacy in this beautiful city of Portland. Your unusual hospitality has already made itself felt. We feel at home and at ease among cordial, sincere friends. We shall do our utmost to make this meeting one of the most pleasant, successful meetings in the history of our Association. How better could we show our respect, and express our appreciation to the citizens of this great state?

I realize that I am displaying no originality when I begin my presidential address with the statement that I have received incalculable benefit from the fact that it has been my privilege, during the past year, to read and critically study the proceedings of our meetings and the recommendations of our presidents of the past thirty-five years. I predict that this fact will continue to be commented upon by our presidents in the future. To review the progress of our Association from the time of its inception, thirty-five years ago, down to the present day, is an interesting and challenging experience. It was born with the dawn of the twentieth century in the city of Richmond, Virginia, where so many worthy projects have been initiated, and from whence capable leaders have stepped forth to carry promising infant projects to fruitful maturity.

ERNEST LITTLE

To-day, three and a half decades later, we are assembled on the opposite side of our continent, where our Association stands forth as a great tribute to such past-presidents as Prescott, Remington, Kaufman, Whelpley, Hynson, Searby and Schlotterbeck, all of whom have passed to the great beyond. It must bring great satisfaction and some measure of pride to the hearts of such men as Edward Kremers, our oldest living Past-President, Wulling, Lyman, Jordan, Rudd and others of their type, who are still faithfully working with the vigor and enthusiasm of younger men.

I wish I might stimulate those of you who have not already done so, to review at least the presidential addresses of the past thirty-five years. You will find it an interesting and decidedly worth-while experience. I believe that the fund of information thus obtained, serving as a background for future deliberations, would greatly increase your efficiency and effectiveness as individual workers and would make for progress within the Association.

In my judgment, the present marks a rather vital period in the life of the A. A. C. P.—vital in the sense that we, in the next few years, must decide whether

the wonderful potentialities brought into being by our predecessors will be fulfilled, or perhaps dissipated by an extravagant and somewhat less idealistic generation

Our Association will either become an increasingly vital, constructive force in pharmaceutical education or it will shrivel and atrophy until it is but a meaningless hulk whose possibilities were allowed to remain untapped by visionless or ineffective association members This, as I see it, is the all important question which we must decide

I firmly believe that the spirit of such pioneers as Remington and Kremers and Whelpley will prevail, and that we shall not become satisfied with modern mediocrity

A few weeks ago, I heard one of our most respected and most dynamic past-presidents remark somewhat as follows

"I wish I knew what is the next step for our Association to take We must go forward It would be fatal to stand still, but I have never before felt so puzzled and uncertain "

I am in accord with the spirit of these remarks but shall take the liberty of revising them somewhat as follows

"The policy which the A A C P should pursue in the immediate future is not as definitely clear as it has been in the past We must progress It would prove most unfortunate if our appreciation of past progress should tempt us to indulge in a period of indolence and self appreciation Such an attitude constitutes retrogression, and if followed for even a short time, leads only to disaster "

There is a great similarity in the spirit of these two statements, but also fundamental differences in their implications

We should all like to feel that we share, at least in a measure, the leadership which my respected friend so well exemplifies Still, we should not abandon caution in working toward such an objective The more dynamic one's leadership becomes, the more essential it is that caution should be one of its distinguishing characteristics There is, perhaps, nothing more deadly than indolence, and no one more impotent than the reactionary At the same time, we realize, that there are few things more perilous than unbridled ambition and possibly no individual more dangerous than the iconoclast I once heard an iconoclast defined as a person who would blow up all existing organizations and institutions in the hopes that when the pieces fall, they may be better assembled The chances are decidedly against improvement when the changes are so profound, and the forces responsible for them so violent I am always a bit suspicious of the iconoclastic reformer, unless he can point to a record of real accomplishment as a result of his past activities He is frequently impelled by an uncontrollable desire for change and for different, if not better, leaders

Normal, natural changes take place slowly but continuously We should not feel that it is absolutely essential for us to make an important pronouncement in order to progress during the ensuing year It may be that the time can be spent to best advantage in substantiating our more recent advances

Those of you who have seen the Washington monument, in our Nation's capitol, will recall that about half way up the monument there is a line of separation which seems to mark, or at least suggest, a temporary cessation of building activi-

ties at that point Upon asking the cause of this apparent line of cleavage, I was told that when the building had progressed that far, definite evidences developed that the foundation was inadequate for further altitude, in other words, they were unable to go higher until they went deeper

It seems very likely that retail pharmacy and possibly pharmaceutical education as well, may have reached a point where they ought not to go higher until they go deeper I realize that it is more interesting and satisfying to build upward in the sunshine of the day, than it is to labor, somewhat unknown, upon a subterranean foundation, important and fundamental as such work may be I know also that as true artisans we shall not hesitate to assume that responsibility which seems most necessary, and which we can best render If, for the time being, it seems inadvisable to build higher, we shall all devote ourselves to the less dramatic, but equally important foundational work, in order that, over the years, the progress of pharmaceutical education may continue uninterruptedly

Pharmacy is built upon a rather broad foundation which in turn supports such correlated institutions as pharmaceutical education, retail pharmacy, manufacturing pharmacy, wholesaling and other pharmaceutical activities We are more interested in certain restricted parts of this foundation, but all of it engages even our selfish attention Colleges of pharmacy cannot enjoy real and permanent prosperity, except in so far as the profession of pharmacy is also prosperous For this and other reasons as well, the interests of retail pharmacy and pharmaceutical education are closely coordinated and somewhat overlapping Perhaps we could advantageously spend a few minutes examining such parts of this general foundation as particularly concern retail pharmacy and pharmaceutical education

Even a cursory examination will reveal the fact that what may be thought of as the very corner-stone of the profession's foundation, namely, professional service, is greatly in need of strengthening I believe this weakness can be remedied and might very properly be attended to before the superstructure is again enlarged One of the great shortcomings of the retail pharmacist is lack of imagination, initiative and originality One of the pitfalls of any retail business is the temptation to sit down in an effectively organized and well-equipped store and wait for things to come to you You may be ever so patient but the end will not be accomplished The physician will not increase his prescription writing simply because the pharmacist wishes him to do so He must be shown that the patient's and physician's welfare, as well as the welfare of the pharmacist, can be best served by so doing

It would be well if our colleges gave more formally organized instruction in the contacting of physicians by pharmacists Such activities should be based, not upon high-pressure methods of salesmanship, but upon the ability to make clear to physicians how the welfare of the patient can be promoted by greater cooperation between physician and pharmacist

Some of you may very properly remark that comparatively recent changes in the curricula of medical colleges have made cooperative endeavor of this sort exceedingly difficult My answer is that the responsibility of our pharmacy colleges does not stop with their undergraduates I feel that, for the time being, at least, they must be prepared to render assistance to the registered pharmacists already in the field and to practicing physicians as well

In New Jersey, a joint committee of physicians and pharmacists, representing

the New Jersey Medical Society and the New Jersey Pharmaceutical Association, are cooperating in drawing up an abbreviated but exceedingly useful New Jersey Formulary. The work of this joint committee was discussed at great length by the New Jersey Medical Society at its last meeting in Atlantic City. Pharmacist members of the Joint Committee were in attendance at this meeting and presented a display of New Jersey Formulary preparations which had been prepared at the College of Pharmacy. A capable prescription pharmacist was in charge of the display at all times to explain the various preparations and the objectives of the Joint New Jersey Formulary Committee to the host of inquiring physicians. These prescriptions are being published in the *New Jersey Journal of Pharmacy* and the *New Jersey Medical Journal*.

The State Medical Society at this same meeting recommended to its county organizations that they invite properly qualified individuals from the profession of Pharmacy to appear before their county groups to assist in increasing the efficiency of the physicians in prescription writing and in promoting the use of such useful publications as the New Jersey Formulary. Needless to say, as much as possible will be done along this line. We find considerable enthusiasm on the part of physicians for this sort of cooperative endeavor. I know for a certainty that these New Jersey Formulary prescriptions are being increasingly used by the physicians of the state and would be still more generally used if we could develop more intelligent interest and continued enthusiasm on the part of retail pharmacists. The initiative and chief motive power must always come from the pharmaceutical group.

The opinion has been expressed that the development of state formularies is a backward, retrogressive step, that such work should be headed up as a national project by the U S P and N F Revision Committees. I can see much force and reason in such a suggestion. I believe, however, that much of what success we have experienced in New Jersey has been due to an appreciation on the part of physicians that they themselves were cooperating in the development of a formulary which would later be jointly used by pharmacists and physicians. They did not feel that a group of individuals, about whom they knew very little, was bringing pressure to bear on them to increase the professional work of the pharmacist. They were possessed of an enthusiasm born of cooperation and kindled by a thoroughly justifiable, if somewhat selfish, satisfaction which one experiences as a result of his personal participation in what seems to be a decidedly worthy project. It is possible that a national committee might supervise this important work in the various states in such a way as to retain the advantages which I have above enumerated.

The field of Dental Pharmacy, which has been so splendidly started by Assistant Dean Schicks is still in its infancy. Those who have had any experience in this field will, I believe, agree that the dentist possesses great enthusiasm to proceed with this type of professional work. I venture the opinion that the professional work of the retail pharmacist would be greatly increased, perhaps doubled, by the proper development of the field of Dental Pharmacy. It is reassuring to find an increasing number of workers appearing to follow up this most important pioneering work. The field is a big one and the surface hardly scratched. I trust that more volunteers will be forthcoming.

Professor Schicks has presented a course in prescription writing to the den-

tists of several county associations during the past two winters. The work has been received with enthusiasm and appreciation on their part. Prescriptions from dentists are coming into our stores in increasing numbers. A good start has been made. Again, this work would be greatly facilitated if we could devise some means of developing greater interest and more effective cooperation on the part of retail pharmacists.

Courses in Laboratory Clinical Pathology, including a comprehensive study of blood, urine, sputum, stomach contents, feces, spinal fluid and exudates, together with such special subjects as Wasserman and Kahn tests, kidney and liver function tests, determination of basal metabolism, the Friedman test for pregnancy, etc., would enable the pharmacist to increase his sphere of professional services to the physician in a manner beneficial to both and advantageous to the patient as well. I realize that courses of this nature are being offered in some, but comparatively few, of our colleges at the present time. It has been successfully offered as a graduate course during the past three years in the institution which I represent. Unusually well-trained and proven teachers are necessary for the successful presentation of the course.

These are but some of the ways in which colleges could more fully cooperate in increasing the professional services of the retail pharmacist and thus help to keep the corner-stone of the foundation of our profession firm and secure.

One hundred years ago the pharmacist was, of necessity, a resourceful man, possessing great initiative and ingenuity. He was responsible for the identification, selection and care of his drugs and the actual preparation of many of his inorganic chemicals, now obtainable from manufacturing chemists. In more recent years, many developments have greatly altered these conditions. The introduction of the pill machine, making possible the manufacture of coated pills on a large scale, the advent of machine-made plasters and other mechanical advances, made it less necessary for the pharmacist to use the highly specialized manipulative technique essential to such important preparations. The manufacture of tablet triturates and compressed tablets served to further reduce the professional work of the pharmacist and has, quite naturally, proved a great temptation to physicians to dispense such conveniently prepared medicaments.

Let us not waste time regretting the changes which the past has wrought, unfortunate as some of them may be, but let us look to the future with a feeling of real enthusiasm for the opportunities which are there presented. The rolling of pills, the making of tablets, the preparation of tinctures, are important and dignified operations, but if we find that some of these processes can be accomplished quite as well by machinery, lessening the time of preparation and greatly standardizing the manufacture of medicines of this type, we should not wish it otherwise. We should not regret that modern grinding machines have made it possible to pulverize in a few hours an amount of crude drug which would have required months if reduced by the pharmacist with the mortar and pestle, as previously done. These changes constitute progress and the pharmacist must progress as well. This, as I see it, is primarily the responsibility of our colleges of pharmacy. The pharmacist has had released considerable time previously required by his professional work. Much of this time is now being devoted to merchandising. It is the duty of our colleges to choose men of professional caliber and to offer to them such broad

fundamental training in the different branches of science as will enable them to use their time in a more professional manner. This is all quite possible and should be one of the main objectives of educators in the field of pharmacy.

Perhaps some of you may say that the institution which you represent has long ago altered its program and curriculum in such a way as to provide adequate opportunities of professional service for its graduates and that you have pointed out and stressed ways and means of effectively applying such talents. Without wishing to ignore any such sincere protests, the present status of retail pharmacy establishes the fact that our past efforts along this line have proved largely ineffective. The desired results have not been attained. It is imperative that we acknowledge our failure and rededicate ourselves to this most important obligation and responsibility. The responsibility rests squarely on our shoulders. The problem can be solved, but colleges of pharmacy must assume the leadership and play the leading rôle.

I do not wish to create the impression that the problem can be solved with fairy-like simplicity. I do not believe that it can. The difficulties involved are profound and fundamental, and only profound methods of solution will prove effective.

We must start at the beginning, with our entering students. We should estimate as accurately as possible the numerical needs of the profession. The overcrowding of any profession means eventual cheapening and loss of professional pride. An accurate estimate of pharmacy's numerical needs will, I believe, make it possible for us to rather carefully select our entering class. This selection should, of course, be based upon a consideration of the scholarship and general ability of the applicants, but even more important than that, upon their character, reliability and aptitude for professional work. It is, perhaps, true that the most profound problems in our professional fields to-day are due not so much to mediocrity on the part of their members, as to misguided ingenuity, lack of professional pride and decent responsibility. An industrious, persistent, conscientious and thoroughly reliable fourth-quarter high school graduate might very well be given preference over a brilliant, personally ambitious first-quarter student who measures success in terms of dollars and who achieves his objectives by whatsoever methods may prove most effective. One should not be thought of as failing to appreciate high standards of scholarship because he has learned to appreciate and evaluate such essential traits of character as industry, sobriety, purposefulness, self-control and honesty as essential complements of ability and power to achieve.

The wise selection of students for professional fields, involving important human contacts and relationships, will never become so standardized as to operate by rule-of-thumb methods.

In this connection, I feel the time has come for the Association to formally start work on the project of developing "Pharmacy Aptitude Tests," which tests should prove a great help to our member colleges in the selection of their students on a basis of character, ability and general aptitude for pharmacy. So far as I know, there are, at the present time, no tests available by means of which we can determine at all accurately, whether or not applicants for admission have the fundamental interests and abilities essential for reasonable success as pharmacy students.

and as pharmacists, hence the large number of failures which we find both in our colleges and in the profession as well

I realize that no system can be devised which will work at all perfectly, but I do feel that we should be able to determine to a reasonable degree of accuracy the abilities and aptitudes of prospective freshmen and thus insure a better grade of student and a higher type of practitioner as well. Such tests would, of course, be used as one of several indications of probable success and hence as only one of several bases of admission to the college of pharmacy

Inasmuch as the development of such tests is likely to require a considerable period of time and should not be hurriedly done, I feel that the work should be begun without delay, making use of such information as may be found in the Charters' report, from the various drug survey reports, the national Pharmaceutical Syllabus, the Association of American Medical Colleges, the American Medical Association and other sources which will be easily discovered as soon as this work is seriously undertaken. Unless some such start is made, we shall find ourselves greatly handicapped in solving many of the problems confronting pharmacy to-day. We should never lose sight of the fact that pharmacy will very largely be what its practitioners desire it to be and that which they wilfully make it

Having made the wisest possible choice of our students, we shall, of course, furnish these undergraduates with such scientific, professional and other training, as will best equip them to meet their responsibilities of the future. In so doing, we should keep ever before us the fact that we profess to be and are recognized as professional schools

The above statement is not made in any supercilious, haughty attitude. We recognize, in the first place, that there is no sharp line of cleavage between professional and non-professional activities. We realize that no operation can be spoken of as being professional simply because it is involved and requires a considerable amount of technical or professional training for its successful execution. Coupled with this must be the desire and determination to render the highest quality of service of which one is capable, quite independently of what the financial return may be. When performed in this manner and in this spirit, the most lowly task becomes dignified, rises to great heights, and constitutes what many people like to think of as professional work

Although the above attitude is indeed a wholesome one, I have never been able to bring myself to feel that any individual who does his best and has learned to do some one thing well, is entitled to be classified as a professional man. It requires much more than good intention to make a professional man. Long years of work and study in order to become familiar with the fundamental branches of science upon which the profession is based, still more intensive study in the specialized field of the profession involved, intellectual honesty, the ability to think clearly and concisely, arriving at conclusions through logical processes of reasoning—these are some of the characteristics which may very properly be expected of the professional man, but they are not enough. Coupled with such knowledge and intellectual accomplishments must be certain traits of character which are of equal or even greater importance. He should be industrious, tolerant, reliable, honest and above all else, imbued with the spirit of helpfulness even to the point of sacrifice. There is no place in any profession for a really selfish individual. The desire for personal

gain cannot be the controlling factor We are all obligated to provide for the future needs of ourselves and our dependents, but if we are to qualify as truly professional men, we must organize all of our activities around the central idea of service, and by that I mean, being just as useful and decent as possible in every human contact and relationship

In like manner, colleges of pharmacy, although they will have many and varied responsibilities of importance, should arrange and organize their activities around the central idea of professional training We should aim to stimulate our students to become useful, rather than wealthy, and efficient, rather than clever We should strive to turn out men whose chief ambition is not to capitalize and exploit pharmacy, but who will give serious profound thought to the problem of how they can best make their contribution to pharmacy and leave it not impoverished, but a little richer and a little more respected as a result of their contact with it On such a foundation we can look to the future of our profession with confidence and courage Without it, we have no guarantee of permanence and certainly very little virtue upon which to base any such expectation

During the past few years I have heard various legislative measures proposed to strengthen the foundation of retail pharmacy and to increase the security of the retail pharmacist Most prominent among them have been

- (a) The Capper Kelly Bill
 - (b) Restricting the sale of patent and proprietary medicines to the drug store
 - (c) Federal and State Drug Codes
 - (d) Pharmacist Ownership Bill
 - (e) Fair Trade Bills such as have recently been adopted by various states
- Etc , etc etc

All of them are primarily concerned with the non-professional activities of the pharmacist Some of them, such as the drug codes, have proved very transient, leaving despair and blasted hopes in their wake Others have been declared unconstitutional by the Supreme Court, still others probably would be so declared were they enacted into law

I have very little hope of affording the pharmacist permanent relief by way of legislation, except in so far as such legislative measures concern themselves with a service in behalf of public health and public welfare, which the pharmacist is especially prepared to render

The pharmacist's greatest feeling of security will be realized when he can stand forth as a truly professional man with the realization in his heart that his legislative needs are few, due to the fact, that he is offering an important professional service which few individuals are prepared to offer

That is the challenge confronting our colleges of pharmacy It is a problem which we and we alone can solve by the following procedure

(1) Careful and conservative selection of students, (2) Stressing professional training in our undergraduate work, (3) Adequate training and advice as to how these possibilities of professional service can best be realized following graduation, (4) Enlisting our services in promoting coöperative endeavor between physicians, dentists and pharmacists, thus increasing their mutual effectiveness in behalf of public health and public welfare

May we rededicate ourselves to this most important responsibility

Some of the more important remaining building blocks in the foundation of pharmacy, underlying retail pharmacy, are professional pride, desire to serve, desire to please, reliability, sustained industry, a conception of success based upon unselfish service, rather than material possessions, initiative and individuality, interest and activity in community affairs, and above all else, honesty

It would be inappropriate for me to discuss these important factors in this address. We all realize, however, that it is our responsibility and duty to develop these qualities and character traits in our students. By so doing, we help to keep secure the foundation of retail pharmacy, promote the success of its practitioners and insure the continued operation of our colleges of pharmacy.

There should be little uncertainty as to the responsibility of our colleges of pharmacy in the immediate future, when such profound and fundamental problems, threatening the very existence of pharmacy as a profession, are awaiting our solution.

The question of how much practical drug store experience should be required of graduates of a four-year course in pharmacy in an approved college of pharmacy, and when this experience should be obtained, is again being agitated by a small but exceedingly aggressive group.

Our Association has never put itself on record in regard to this question. Inasmuch as it pertains to the training of a pharmacist, I feel that we should so.

It is, I believe, very generally accepted that not more than one year of practical experience should be required of four-year college graduates. The question which has recently been reintroduced is whether or not this practical experience must be obtained following graduation. One state has recently passed legislation requiring at least one year of practical experience in an approved pharmacy, following graduation, as a prerequisite to the practical State Board of Pharmacy examination.

Some of the arguments put forth in favor of this requirement are as follows:

- I Such apprenticeship would closely parallel the year of internship which has worked out successfully in the field of medicine.
- II It would be obtained at a time when the apprentice would receive the most benefit from the training and would be of greatest value to his employer.
- III It would greatly simplify the task of regulating practical experience by Boards of Pharmacy.

May we spend a few minutes critically reviewing these arguments?

We are, of course, aware of the fact that the medical internship could hardly be placed at any other time than following graduation. The practitioner of medicine has few, if any, non-professional responsibilities and hence the student of medicine is not qualified to perform safely any of the duties of the physician until the completion of his college course, nor is he permitted by law to do so. His period of internship is served at a time most advantageous for himself, for the profession of medicine, and for the patient as well.

It sounds quite logical, therefore, to state that pharmacy should capitalize the experiences of medicine and that the embryo pharmacist should also be required to serve a year of internship in an approved pharmacy following graduation, before he is qualified for the practical state board of pharmacy examinations. The two situations, however, are not as similar as they appear to be upon superficial examination. The parallel is apparent, rather than real.

The pharmacy student, during his college course, is well qualified to perform most of the duties and responsibilities of the pharmacists and to obtain such additional training as we wish him to receive, as a supplement to his college training. This can be done with profit to himself and his employer and with safety for all concerned. It is not further training in professional work which the graduate of a four-year course in a recognized college of pharmacy most needs. This is being adequately taken care of both from the practical and theoretical standpoints. He must become familiar with the drug store in all its various aspects and become acquainted with the atmosphere prevailing therein. He must learn to feel at ease in the store, develop poise, learn how to approach customers in a pleasing manner, and discover the most efficient way of presenting goods to the prospective buyer. These are some of the things which can best be learned in the store itself and which make one year of practical drug store experience desirable, if not essential.

There is no reason, however, why such experience should necessarily follow graduation. In fact, it can be obtained to best advantage during the four-year college course. The three months' vacation periods between the sessions of the four college years afford the best opportunity for this work.

When the suggestion of a year's apprenticeship, following graduation, was first made by Doctor Beal many years ago, and later advocated by Doctor Army in one of our pharmaceutical journals, it was far more appropriate than it is to-day. At that time many colleges were not giving the profound training in practical and dispensing pharmacy which they are to-day offering. Doctor Beal's suggestion was perhaps a good one at the time it was offered. It is unfortunate that it has become antiquated and impractical before being seriously promoted.

I fear it is also not generally clear just how the apprentice would prove more useful to his employer during the year following graduation. He would not be qualified legally to perform any additional professional services. He could not compound prescriptions, sell poison, etc., except under the immediate direction of a registered pharmacist. His usefulness would not be greatly increased. In fact, it is very likely that a college graduate would be less willing to perform certain menial tasks which are essential to his all around training as a pharmacist and which would enable him to be of greatest value to his employer.

The statement that it would be simpler for boards of pharmacy to control practical experience is not a matter of primary importance. Many state boards succeed in keeping an adequate check on practical experience at the present time, even though the task is not an easy one. It is quite possible that this particular responsibility of state boards of pharmacy would be simplified by the proposed change but this advantage is more than counter-balanced by the less favorable considerations which I have enumerated.

A careful study of this question has led me to the following conclusions

- I That the year of apprenticeship in a drug store following graduation is not analogous to the year of internship in medicine. The conditions are so different as to make it dangerous rather than wise for us to unthinkingly imitate medicine in this detail.
- II More value would be received from the year of apprenticeship if it were synchronized with the college work rather than following graduation. This has worked out very satisfactorily in the field of engineering and is in accord with the best thought in the field of pedagogy.

- III The apprentice would be of little more value to the pharmacist than before graduation unless the illegal practice of pharmacy is indulged in. The college graduate would be prepared to safely compound prescriptions and would probably be called upon to do so. Do we wish to put ourselves in the position of encouraging such illegal practice?
- IV An important responsibility of the boards of pharmacy might be somewhat simplified but at too great a risk to pharmacy and too great a hardship on the prospective pharmacist.
- V It would lengthen the period of the pharmacist's training from four to five years with no legitimate advantage to anyone. We should favor as much time as may be necessary to train, educate and prepare the pharmacist for his greatest usefulness and no more than this should be required.

I bespeak serious consideration of this question, with a view to making the policy of the Association known at the earliest possible time.

In case the Association feels that it is not in a position to go on record in regard to this matter at this time, I recommend that the executive committee be requested to give the problem careful consideration and present a definite recommendation to the Association at its 1936 meeting.

You have all heard recommendations from some of our members that the minimum course in pharmacy be lengthened from four to five or even six years. Others are advocating one or two years of pre-pharmacy work which might be carried out in such a way as to accomplish the same objective.

These recommendations are, of course, based upon the belief that need exists for men of more profound training, both in pharmaceutical industry and in promoting the possibility of professional services in the field of retail pharmacy.

I wonder if these needs could not be met by encouraging the development of graduate work on the part of such colleges as are in a position to adequately render such services, rather than changing the minimum pharmacy college course at this time. It seems to me that such is the case.

I do not mean by this that there should be a hurried development of graduate work on the part of our member colleges. Rather it should be gone about in a cautious, conservative manner. It is difficult enough to build up a strong staff for undergraduate teaching. It is much more difficult to obtain the services of individuals who can at the same time direct graduate and research work as well. It is likely that there are but few member colleges who are in a position to assume any such responsibility at this time. However, our colleges of pharmacy at the Universities of Florida, Maryland, Wisconsin, Minnesota and Washington, are among those who have set the example as to how it can and should be done.

I suggest that the development of a sound, conservative program of graduate work be considered as the next step in enlarging our educational program.

Such programs should be announced and the work offered, only after adequate graduate facilities, both from a standpoint of teaching and equipment, have been made available.

Few things could be of greater importance in pharmaceutical education than that we should be offering the best possible curriculum to our students. I believe it would prove advantageous if our Committee on Curriculum and Teaching Methods would concern itself more particularly with curriculum problems during the next several years. I realize, of course, that we are represented on a committee whose re-

sponsibility it is to draw up a national Pharmaceutical Syllabus, and I certainly have no desire to reflect unfavorably upon the functioning of that committee

Following up President Havenhill's suggestion of last year, I recommend that our Committee on Curriculum and Teaching Methods be requested to collect and study all available information bearing upon this important subject. Such material should include the findings and recommendations of the National Pharmaceutical Syllabus Committee and the various curricula as outlined in the catalogs of our colleges of pharmacy. With all this information before them, they should be able to draw up and present to us what might be called "An Ideal Pharmacy College Curriculum." Acceptance of this curriculum in its entirety would not be obligatory on the part of Association members. I am not aiming at greater standardization, but rather the crystallization, from the standpoint of pharmaceutical educators, of the various recommendations with which we are all more or less familiar.

Our committee might see fit to offer several curricula, one to prepare our graduates for retail pharmacy, curricula for various specialties in pharmaceutical industry, and perhaps for pre-medic training as well.

It is likely that after two or three years of operation along this line the report of this committee might become rather brief. I am certain, however, that there would always be something of a worth-while nature to report to us for our consideration.

I trust you will give close attention to the report of Dean Leigh's Committee on the Establishment of a Pharmaceutical Corps in the United States Army. Dean Leigh has given very conscientious and capable attention to the responsibilities of this committee during the past several years.

I am decidedly puzzled as to what the future activities of this committee should be. It might assume a more active, aggressive policy than it has been pursuing, but I believe there are many among us who feel that it would be unfortunate if we were forced to work at cross purposes with the Surgeon General of the United States Army.

I feel that the future policy of this committee should be based solely upon a consideration of the welfare of the enlisted men and the efficiency of the United States Army. Any coveted goal which we might achieve would, I fear, eventually prove disappointing unless we were prompted by the highest motives and objectives in achieving it, and unless we are prepared to render a real, vital, worth-while service, should we prove successful in our endeavor. I hope that Dean Leigh's report may greatly clarify the situation for us.

One of the most encouraging and comforting circumstances in the field of pharmaceutical education with which I am familiar, is the large number of capable, well-trained young men in our ranks who stand ready to assume their full share of responsibility, young men who, I believe, will make full use of our experiences of the past, but who may be possessed of greater freedom of action, due to the fact that they have somewhat less regard for the traditions of the past, than is found in the hearts of older men.

One of our most important responsibilities is to see that full use is made of these younger men. This, I believe, was one of the objectives which Dean Lyman had in mind when he requested the appointment of a "Problems and Plans Committee,"

of which he is now chairman I see possibilities of this committee developing into one of our most vital and important committees

As we endeavor to make greater use of the younger men, I trust that they, in turn, will retain an adequate appreciation of the vital need of older, more experienced individuals I like to picture maturity and youth traveling life's highway hand in hand, the youth pointing enthusiastically to opportunities which only he can clearly see, while the older man skilfully and diplomatically guides him safely past many perils and pitfalls which have escaped his attention, blinded as he is by the brilliance of the opportunities upon which his attention is so keenly fixed

May this picture represent the condition which is to exist in the A A C P in the years to come No condition could be more ideal

I recommend that the Association make available in inexpensive mimeograph form all of the past presidential addresses of this Association and that ten copies of this material be sent to each member college at the Association's expense

It is true they are available in the Proceedings My thought is to place them before our members in more available and convenient form

I suggest that final decision on this recommendation be left to the Executive Committee after estimates of the cost involved have been obtained

Your Association has been most active in matters pertaining to pure food and drug legislation during the past year Our activities along this line have been guided by an exceedingly efficient legislative committee, consisting of Deans Rudd, DuMez and Dean Jordan, *Chairman*

Dean Jordan and your president spoke before the Committee on Commerce of the United States Senate at a public hearing on Senate Bill S5, Print 3, the so-called Copeland Bill This bill subsequently passed the Senate, in modified form, but unfortunately was not brought out of committee in the House of Representatives

I shall refrain from giving more details pertaining to legislative matters at this time, for fear of encroaching on the report of Dean Jordan's Committee I feel that this committee should be continued and that it should be instructed to play an active part in behalf of legislation intended to promote public health and welfare I so recommend

The Dean of one of our Eastern colleges has very emphatically expressed the opinion that the A A C P should concern itself solely with matters of pharmaceutical education, leaving pure food and drug legislation, pharmacy corps in the United States Army and similar problems to the A P H A, N A B P, N A R D and related pharmacy organizations

I certainly agree that the major responsibilities of the A A C P are in the field of pharmaceutical education I recognize the danger of spreading one's energies too thinly, but I also feel that it would be most unfortunate if we did not stand ready to lend a helping hand wherever possible in the general field of pharmacy I do not feel that any organization should consider that its activities must be forever limited by the purposes set forth in its constitution

It is only by properly coordinated and, not infrequently, by overlapping activities of these various organizations, that the greatest good can be accomplished in behalf of pharmacy

I recommend the appointment of a professional relations committee whose

responsibility shall be to bring before our members the ways and means which are being employed in the various states, of increasing the professional services of the retail pharmacist and improving his contacts and relationships with physicians and dentists. The efficient functioning of such a committee should make it possible for our colleges of pharmacy to more effectively cooperate in increasing the professional services of our present and future retail pharmacists.

I am pleased to report to you that our Association has been admitted to membership as one of the affiliated organizations of the American Association for the Advancement of Science. Membership in this respected and influential organization gives a contact which will add to the dignity and prestige of our Association as a professional group. I feel that we should make the most of this new contact.

A most creditable pharmacy program was presented at the Minneapolis meeting, held June 27th of this year. This program was presented in conjunction with the division of Medical Sciences, under Section N, of the associated societies.

At the St. Louis meeting, to be held from December 30, 1935 to January 4, 1936, pharmacy will have the opportunity and decided responsibility of again presenting such a scientific program. This new venture will prove to be either a splendid asset or a decided liability to our Association and to the profession of pharmacy. It is most essential that the project succeed and that the A. A. C. P. play its full part in insuring such success.

I recommend that, for the ensuing year, the Executive Committee be made responsible for the A. A. C. P. activities in this scientific program and that at the 1936 annual meeting they recommend to us that, which in their judgment, is the best permanent policy for this Association to adopt in this connection.

I am sure we all agree that a joint meeting with the American Medical Association or American Dental Association would prove most helpful to pharmacy and to the medical and dental professions as well. I fear that many of you are already questioning the wisdom of spending even a few minutes discussing a recommendation which is so obviously impossible of attainment. The solution of any problem is made immeasurably more difficult if approached with an attitude of defeatism.

There never was a time when physicians and dentists were more willing and eager to cooperate with the pharmacist than they are to day. I believe it is within the realm of possibility that such a meeting or meetings can be arranged.

I recommend that the incoming officers and members of the Executive Committee be directed to give serious thought to this proposed project and that they be requested to present a report of their deliberations at the 1936 meeting. This is one of several projects which might well be referred to a committee on professional relations.

If it seems impossible to arrange such a joint meeting, in the sense of sharing a half-day joint program with either one of these organizations, it is possible that permission would be given us to place a speaker on the program of one of their annual meetings. Such a speaker should be able to diplomatically and effectively point out the need for greater cooperation between these three professional groups and perhaps pave the way for a future joint meeting.

I have the very definite feeling that if this general problem is given careful consideration, the Executive Committee will be able to present to us a recommendation possible of attainment, which will prove an effective start in the right direction.

I wish to thank our secretary, the chairman of the Executive Committee, our vice-president, committee chairmen and the other officers and members of the Association for the really fine, helpful support and cooperation which has been accorded me during the past year. Without such cooperation but little of value could have been accomplished. With it, the past year has proved to be a most happy and prosperous one, at least so far as your president is concerned.

ADDRESS OF THE PRESIDENT OF THE NATIONAL ASSOCIATION OF BOARDS OF PHARMACY

BY CHARLES HALL EVANS, PRESIDENT

Mr. Chairman, Members of the National Association of Boards of Pharmacy and Guests

In selecting "The City of Roses" as the meeting place for the thirty-second annual convention of the *National Association of Boards of Pharmacy*, we have chosen a section rich in historical tradition and one noted for its scenic beauty.

Only a short distance away is the Pacific Ocean. Mount Hood with its snow fields and glaciers, vast stands of forest, jewel-studded lakes, the beautiful Columbia River Highway, Bonneville Dam and Multnomah Falls are but a few of the many wonderful sights within easy reach of this beautiful city.

In coming to Portland, we are meeting for the first time in the history of the Association in the Great Pacific Northwest, in fact, it is the first time in twenty years that we have held a meeting west of the Rockies, the San Francisco meeting of 1915 being the last.

We who live in the densely populated sections of the country where most of the conventions are held can attend the meetings every year with little effort and expense. These meetings mean something to us beyond the formal program and the business transacted.

There is the opportunity of getting acquainted with brother examiners from other states, who have the same interest and the same problems as we have, and a bond of common understanding results. It is on this spirit of mutual cooperation that confidence between boards rests, it is the very foundation of the Association itself.

I want to remind you that our Western friends have been denied this privilege because of certain economic and geographic barriers. We have broken the isolation this year by coming out here for the convention and they have responded most whole-heartedly by attending the sessions we have planned. At the most, we have only a few days together, so let us make the best possible use of them by getting acquainted immediately.

CHARLES HALL EVANS

To our Western colleagues, I want to say that your problems are our problems and while a formal program is necessary to cover the business of the Association, you are most welcome to interrupt at any time and ask questions

ASSOCIATION ACTIVITIES

Economic conditions the past few years have made it necessary for us to outline and adhere rather strictly to a budget for operations, and we had to cut operations sometimes in certain directions when we did not want to do so. But the policy has been a sound one, as our financial condition to-day indicates. We held our 1934 convention before the close of the fiscal year but I am glad to inform you that when the books were closed as of June 30, 1934, we showed a gain of some \$400 00, instead of drawing on cash reserves as we had been doing for the three previous years.

The budget for this year was outlined on the basis of \$15,000 00 income from dues and reciprocal applications, with an estimate of 500 applications to be issued. However, at the time this address is being written, I am informed that more than 600 applications have been issued which indicates that the financial reports this year will be even better than last. As the details will be given in the reports of the secretary and the treasurer, as well as the Executive Committee, I shall omit them here.

DISTRICT MEETINGS

Since the Washington convention, Districts Nos. 1, 2, 4, 5 and 6 have held meetings, and I am informed that District No. 7 will hold a session here in Portland on Wednesday. This is a splendid record, and I want to thank the vice-presidents for the whole-hearted cooperation they have given me.

Also, I want to thank you for the invitations to attend these district meetings, I wish I could have been present at every one of them. I did attend the Sixth District meeting at New Orleans. Mac Childs, the acting chairman, had worked out an excellent program and the meeting was well attended.

One of the greatest benefits that we derive from our district meetings is the friendly fellowship which develops between the board and college members of the group. We get to know our neighbors more intimately and we find that our problems in reciprocity and in examinations are more easily met when thorough understanding exists.

While I would not minimize the great good accomplished at these meetings, yet there is a grave danger when measures are sponsored which break away from the ideal of national uniformity which is the primary purpose of the Association. We must remember that a condition that may prove ideal in a particular district may not work out well in other districts, or nationally. We must give consideration to the make-up of the various districts, the distances covered, the population, the number of colleges of pharmacy, and other factors that make each district different from the others.

Each district has a certain amount of business to transact which is of local import only, which has no effect on national policies. On matters of national import, great care should be exercised by those in charge of the program to see that the time is not spent in discussing new and untried ideas which may be suitable

for the particular district concerned but which would not receive the majority support necessary to make them effective nationally. Such discussions really harm the cause of uniformity.

We must make progress, we cannot stand still. Times and conditions are rapidly changing, yet we should be ever mindful of the cardinal objectives of this Association as laid down in our Constitution.

Before we leave the basic principles, as yet unfinished, let us see to it that all the districts have caught step with the march before we proceed with new objectives, that may retard progress on the goals nearly attained.

RECIPROCITY

Article 2 of our Constitution states the object of this organization to be the promotion of "inter-state reciprocity in pharmaceutic licensure, based upon a uniform minimum standard of pharmaceutic education and uniform legislation, and to improve the standards of pharmaceutical education and licensure by co-operating with State, National and International agencies and associations having similar objects."

While the subject of reciprocity has been discussed fully every year, yet as stated in Article 2 just read, it is the corner-stone of the N A B P.

Reciprocity boiled down is essentially the application of common sense. With the constantly changing personnel of our boards of pharmacy, reciprocity has been in "hot water" in some states due to a desire on the part of the inexperienced members to adhere strictly to the letter of the law rather than to use the discretionary powers vested in the board of pharmacy under that law. An educational program undertaken by the older and more experienced members of the board to instruct these new members in such matters would overcome the friction and save the Secretary's office much unnecessary correspondence.

LEGISLATION

Chairman Mac Childs of the Legislative Committee will cover this phase of our activities in his usual efficient manner. I shall not make other comment than to say that we welcome Arizona and New Mexico to the list of states requiring college graduation for entrance to the board examination and congratulate them. Several other states tried and failed—we can only urge them to try again at the next session. Iowa also is to be congratulated on having increased its two-year college attendance requirement to college graduation. Also a few of the states cut experience requirements to one year, in view of the four-year course. Thus the steady march of progress toward a uniform goal goes on.

Let us as an Association, and especially the bordering neighbor states, lend every possible assistance to the five remaining states without any provision for compulsory college education—Delaware, Massachusetts, Nevada, Tennessee and Vermont, so that they may attain this goal by the year 1940 as set out in the recommendation of President Gilbert last year.

CONVENTION ATTENDANCE

A vigorous effort on the part of the N A B P should be made to increase the average yearly attendance at the conventions. There are probably other reasons

for non-attendance but "lack of funds" seems to be the main cause. Out of 49 member boards, only 30 send delegates regularly.

In those states where funds are not available for traveling expenses from the board or the state treasury, the state pharmaceutical associations should be called upon for help. The initiative for such a move rests with the older board members who understand the importance of such representation, it is up to them to stress it at the state association meetings. Certainly, the pharmacists of each state are entitled to at least one delegate to represent their interests at a meeting where rules which affect the reciprocal privileges of every pharmacist are made.

In most states, the governor makes his appointments to the board of pharmacy from a list submitted by the state pharmaceutical association. Fitness as an examiner should be the first consideration, of course. However, there are usually many contenders for the honor of serving on the board, here again the ex-board members can be of service by urging the selection of those who are willing and able financially to make certain sacrifices that should go with the honor, namely, willingness to attend the N A B P conventions at their own expense when necessary. I am including a recommendation covering these points at the conclusion of this address.

BOARD APPOINTMENTS AND HIGHER STANDARDS

In 1936, the first four-year classes will be presenting themselves for board examinations. As an organization, the N A B P has done much to promulgate these higher standards. With a better class of student now entering the profession, the next step would seem to be improvement of our own board examinations. As the examiner is a political appointee with full power to act, only diplomatic persuasion can be used, assistance, usually, cannot be rendered unless it is requested.

The system of having the recommendations for the appointments come from the pharmaceutical association has released the governor from responsibility to a great extent and placed it with the profession itself. Have we taken this duty too lightly in the past? It is true that we have had honest, conscientious men, but have they always been the most capable or the ones best fitted to undertake examination work? Has it not become more or less a habit to award the state board appointments to those who have been most active in state association work? Are such persons always the best examiners? True, they do deserve glory for having given the time and effort it takes from selfish interests to further the interests of the state group as a whole. But such men often have devoted much time and thought to the legislative and commercial angles, such as fair trade practice bills, working with manufacturers to better conditions, and have had little time left for the study to fit themselves for specialized examination work. In each state, if you search, you will find men with a particular bent for the professional angle, who keep abreast of the developments in modern chemistry and medicine, because they are interested in these things. They may not have done a great deal of committee work in the state association, or they may not have held office, but they are peculiarly fitted for board examination work. Isn't it to our own interest to give them an opportunity to render service instead of trying to fit a square peg in a round hole?

All that I say is not meant in any spirit of criticism of members now serving on the boards or of those who have served in the past. We have now and have had in

the past many exceptionally capable men, but how much more we could accomplish if *all* board members were of this type Under the four-year course requirement, the candidates who come to us will be better-grounded in the fundamental sciences and our board members must be able to meet them on the same plane or criticism will result Already, there is evidence of such a critical trend

I believe that this is a situation which should be brought to the attention of the state pharmaceutical associations by the N A B P and with this in mind, I have formulated a recommendation at the conclusion of this paper If adopted, a copy is to be transmitted to each state association by our secretary

IN MEMORIAM

Each year it is the duty of the President to report the deaths of those from our ranks, both active and past members, who have passed on to their final reward The list includes

W E Bingham, Alabama
F T Hafelfinger, District of Columbia
Alex F Peterson, Montana

At a later session we shall allow their colleagues to pay a more fitting tribute to their memory but at this time, I think it appropriate that we stand for a moment with bowed heads in silent tribute to the memory of these departed friends

In the passing of Dr Bingham, the N A B P has lost one of her oldest and best loved friends as well as her first Honorary President Only those who have been associated with him in the work these many years can understand how much he has meant to us

CONCLUSION

I appreciate deeply the honor that has been accorded me as the first Georgian to be elected to the presidency of this great organization If you will refer to your map, you will see that I have traveled from the next to the last state on the southeastern boundary of the United States to the next to the last state in the northwestern part to attend this meeting I am sure that a trip like this must inspire in every one who takes it a greater love of country, especially in those from eastern, central and southern states where space is more limited

I want to thank the committees, the vice-presidents and the other officers for their splendid cooperation during my term of office

Secretary Christensen has forwarded me copies of the most important correspondence of his office, and I have become acquainted with the great amount of work attached to the central office I want to commend Secretary Christensen and the entire personnel of his office for the very efficient manner in which the work of the Association is carried on

As I step back into the ranks, I want each one of you to know that I am ready and willing at all times to answer any call for the promotion of pharmacy

There are many vital issues at stake in these times There is a clarion call for leadership from the ranks of the pharmacists of the nation Aside from the Pharmacy Corps legislation, the Pure Food and Drugs Act and the professional and commercial pharmacy question, there are many issues of a strictly commercial or

economic nature that will require the cooperation of all pharmacists everywhere and unified leadership

May we as board members and enforcement officers accept the challenge and institute in our own stores and communities an educational program that will place pharmacy where she belongs and give her rightful professional recognition!

Recommendations

Resolved, That in the interest of bringing about closer coöperation between states, every board of pharmacy should be represented at the annual N A B P conventions Where the state treasury allows no such budget, the state pharmaceutical association should make some provision for sending a board delegate to represent the interests of the pharmacists of that state Where neither the state treasury nor the pharmaceutical association can assume this expense, some consideration should be given to the willingness of board members personally to make such a sacrifice when the appointment lists are made up, but not overlooking the fact that fitness as an examiner should be the first consideration

Resolved, That the N A B P ask the coöperation of state pharmaceutical associations by requesting that the first consideration in submitting lists of appointees to the governor for appointment to the board should be the fitness of such persons as examiners, rather than activity in state association affairs, the object being to improve the quality of state board examinations in the future

REPORT OF THE FAIRCHILD SCHOLARSHIP COMMITTEE

The Fairchild Scholarship Committee of this year is composed of Robert P Fischelis, Ernest Little C H Evans and E G Eberle, *Chairman* The University of Michigan, among others, presented no candidates for the examination and the Director of the School of Pharmacy, Howard B Lewis with the assistance of members of the Pharmacy faculty, consented to prepare the questions for the examination and grade the answers

Twenty-one candidates participated in the examination representing twelve schools The examinations were given under three subjects Pharmacy, Chemistry and Materia Medica The highest average was made in Pharmacy next in Materia Medica lowest Chemistry The lowest average was made in Chemistry next in Pharmacy, next in Materia Medica Candidates of the same school did not have closely related records The candidate making the highest average tied with another for second place in Chemistry was first in Materia Medica and first in Pharmacy The second in rank was sixth in Chemistry third in Materia Medica and sixth in Pharmacy The one ranking lowest in general average was lowest in Chemistry, was next to the lowest in Materia Medica and next to the lowest in Pharmacy The one lowest in Materia Medica rated next to the lowest in Chemistry and twelfth highest in Pharmacy No further effort has been made to draw deductions

FERDINAND ZIENTY

The candidate making the highest average in the Examination for 1935 is Ferdinand Zienty of Chicago, Ill. His standing was high both in High School and Junior College and he was commended as "an energetic young man of fine character."

The winner of the Fairchild Scholarship for this year was graduated from the University of Illinois College of Pharmacy with high honors, receiving "A" in every subject except one, Physiology, in which he was graded "B." He graduated from the 4 year course, the last year's subjects included Food Analysis and Microscopy of Foods. The first year course is administered as a pre pharmacy year of 30 semester hours of work in liberal arts and science in an accredited college and including certain specified subjects such as English, General and Organic Chemistry, and Mathematics (Algebra and Trigonometry).

Mr Zienty was awarded the degree of Bachelor of Science by the University of Illinois. He intends to continue his studies in Pharmacy.

The Committee desires to thank Director Howard B. Lewis and members of the faculty of the University of Michigan School of Pharmacy for their cooperation.

(Signed) ROBERT P. FISCHELIS, C. H. EVANS
ERNEST LITTLE, E. G. EBERLE, *Chairman*

ASSOCIATION BUSINESS

AD INTERIM BUSINESS OF THE COUNCIL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 1934-1935

Office of the Secretary 2215 Constitution Ave., Washington, D C

LETTER NO 21

July 19, 1935

To the Members of the Council

107 *Printing and Binding the Recipe Book II* Motion No 35 (Council Letters 19, page 581, and 20, page 583) has been carried and the contract is awarded to the Mack Printing Company

108 *Election of Members* Motions Nos 36 and 37 (Council Letters 19, page 582, and 20, page 583) have been carried and applicants for membership numbered 219 to 261, inclusive, are declared elected

109 *Distribution and Sale of the National Formulary VI and the Recipe Book II* The following communication has been received from Chairman DuMez of the Committee on Publications

"Invitations for Bids for the Distribution and Sale of the National Formulary, Sixth Edition, and of the Recipe Book Second Edition, were recently issued in accordance with Motion No 13 (Council Letter No 8, page 1245), to the following firms to whom invitations for Bids for the Distribution and Sale of the U S P XI were sent at the same time

William Wood & Co, 51 Fifth Ave, New York, N Y
W B Saunders & Co, W Washington Square, Philadelphia, Pa
P Blakiston's Son & Co, 1012 Walnut St, Philadelphia, Pa
Lea & Febiger, 706 Sanson St, Philadelphia, Pa
J B Lippincott Co, E Washington Square, Philadelphia, Pa
D Appleton & Co 29 W 32nd St, New York, N Y
William F Fell, 1315 Cherry St, Philadelphia, Pa
William J Doran, 7th & Arch Sts, Philadelphia, Pa
McGraw-Hill Publishing Co, 320 W 42nd St, New York, N Y
Mack Printing Company, Easton, Pa

' It will be recalled that these firms were requested to bid \$3 34 per copy and additional on the N F VI and the R B II, in buckram binding and \$4 67 per copy and additional on the N F VI in leather binding

"Bids were received from the Williams and Wilkins Company, P Blakiston's Son & Co, and the Mack Printing Company Several of the firms declined to bid

' The bid of the Mack Printing Company is the highest at \$3 34 plus 25 cents or \$3 59 per copy for the N F VI and the R B II in buckram binding, and \$4 67 plus 40 cents or \$5 07 per copy for the N F VI in leather binding and is identical with their bid for the U S P XI This company also agrees that transportation charges will be prepaid on all copies sold at the full retail prices and have listed twenty-two publications in which the books will be advertised, which are satisfactory

"The Board of Trustees has accepted the bid of the Mack Printing Company for the distribution and sale of the U S P XI In addition to the large return to the A P A which their bid will yield, there are advantages to be expected from having the same firm distribute and sell the U S P XI N F VI and R B II especially as this firm is printing and binding the books

"It is believed that the Mack Printing Company is sufficiently experienced through its various connections, to carry out the contract successfully and I recommend that the contracts for the distribution and sale of the N F VI and R B II be awarded to the firm on the basis of its bid "

(*Motion No 38*) *It is moved by DuMez that the contracts for the distribution and sale of the National Formulary VI and the Recipe Book II be awarded to the Mack Printing Company, Easton, Pa, on the basis of their bid*

Chairman DuMez requests that a vote be called for at this time in order that, if possible, the contracts may be completed promptly. The vote will be considered as tentative if there is objection or if any member of the Council desires to comment or to have additional information.

110 *Applicants for Membership* The following applications properly endorsed and accompanied by the first year's dues have been received:

No 262, Nicholas B Solonen 615 E 4th St, Muscatine, Iowa, No 263, Geo Roeder, P O Box 131, Rahway, N J, No 264, John C D'Arienzo 131 Sheridan Ave, Paterson N J

(*Motion No 39*) *Vote on Applications for membership in the American Pharmaceutical Association*

E F KELLY, *Secretary*

LETTER NO 22

August 3, 1935

To the Members of the Council

The Second Meeting of the Council for 1934-1935 was held at Multnomah Hotel, Portland, Oregon, on Saturday August 3 1935, beginning at 10 20 A M, with the following members present: Hilton, Fischels, Beal, Army, Christensen, Adams, Geo D Beal, Eberle, DuMez and Kelly.

111 *Election of Members* The secretary reported that Motion No 39 (Council Letter No 21, page 682) had been carried and that applicants for membership numbered 262-263 and 264 are declared elected.

112 *Minutes of the Council* On motion of Army—Adams, the minutes as printed in the JOURNAL were accepted.

113 *Use of Text of N F VI* The following letter from Secretary Leech of the Council on Pharmacy and Chemistry of the American Medical Association was read:

July 18, 1935

Please convey to the Council of the AMERICAN PHARMACEUTICAL ASSOCIATION the grateful appreciation of the Council on Pharmacy and Chemistry for permission to use certain portions of the text of the National Formulary, Sixth Edition, in the forthcoming editions of:

Useful Drugs

Epitome of the U S Pharmacopœia and National Formulary

Hospital Practice for Interns

This is to be without charge.

It is understood of course that the publications including this text will not appear until after the National Formulary VI is issued and furthermore that the suggested statement of permission will appear on the back of the title page.

(Signed) PAUL NICHOLAS LEECH, *Secretary*
Council on Pharmacy and Chemistry

114 *Committee on Finance* The following letter and report from Chairman Philip were read:

July 29, 1935

It is with deep regret that I am forced to be absent from the council and the meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION held this year in Portland, Oregon.

To members of the council I send greetings. I know the council's deliberations will be in the interest of the AMERICAN PHARMACEUTICAL ASSOCIATION, the Profession of Pharmacy and in the activities of our ASSOCIATION from the new magnificent Headquarters Building here in Washington.

(Signed) W BRUCE PHILIP

The Committee on Finance respectfully submits to the Council the usual summary of receipts and disbursements for the first six months of the year

It is to be noted that the estimated budget for 1935 was fairly accurate as to receipts and disbursements \$16,002 40 has been received, and \$15,625 82 paid out

No budget allowance for the year has been exceeded during this period and the majority of the budget allowances will carry the respective expenses for the year It is to be expected that items such as the National Formulary will just prior to the issuance of a new volume, be low in receipts and proportionately higher in expense

There are also other items as fuel, when the expense is heavier in the winter months

In addition to this brief summary of budget receipts and disbursements, the Committee desires to report to the Council with respect to the sale and transfer of the following bonds Under the Second and Third Calls, October 15, 1934 and April 15, 1935, \$21,800 00 in Fourth Liberty Loan 4 1/2% Bonds were called for payment Under authority of the Council, the secretary and treasurer of the ASSOCIATION exchanged the bonds for U S Treasury 2 7/8% Bonds with the exception of three \$100 00 bonds in the Endowment, Centennial and Procter Monument Funds respectively, which were cashed and three \$1000 00 bonds in the Life Membership Fund which were cashed and the proceeds transferred to the Current Fund—one in the fall and two in the spring It was necessary to pay a premium of 1 2 /3, on the \$6000 00 bonds subject to the second call, the \$12,500 00 bonds subject to the third call were exchanged on an even basis

The treasurer is keeping a separate account of all investments for the Headquarters Building property and equipment The amount to July 31, 1935 was \$572,196 07

On motion Adams—Geo D Beal, the report was accepted and filed

115 Committee on Property and Funds Chairman Fischelis read the following report

ARTICLE III of Chapter II of the By-Laws of the Council provides that this committee 'shall have charge of the administration of all the property and established funds of the ASSOCIATION' and that "the committee shall consider applications for grants from the interest derived from the established funds and at as early a date as possible shall report to the Council such recommendations as may be deemed proper " The personnel of the committee is definitely provided for in the By-Laws of the Council and consists of the President the Treasurer, the Chairman of the Council, the Chairman of the Committee on Finance and the Secretary of the ASSOCIATION

The report of the treasurer presents, in detail, the status of the various funds which have been established from time to time for specific purposes under the custody, or administration, of the AMERICAN PHARMACEUTICAL ASSOCIATION We have been advised by one of the Executors of the estate of the late Frederick B Kilmer that a bequest of \$3000 00 has been made by him to the AMERICAN PHARMACEUTICAL ASSOCIATION in Clause 6 of his will which reads as follows

6 I give and bequeath unto the AMERICAN PHARMACEUTICAL ASSOCIATION, organized under the District of Columbia, the sum of Three Thousand Dollars to be held in trust, the income to be applied to the awarding of a prize for meritorious work in pharmacognosy, such prize to be known as 'The Kilmer Prize,' or an equivalent designation In awarding the prize preference to be given to studies in vegetable drugs The recipient of the prize shall be a graduate in pharmacy Teachers in colleges of pharmacy workers in pharmaceutical laboratories, are to be excluded from competing for the prize Prize to be awarded under such conditions as the ASSOCIATION may elect Funds arising from the income which may not be used are to be added to the amount of the prize or added to the principal, as the ASSOCIATION may elect "

To date the estate has not been finally settled so the bequest has not been officially received It is likely however, that it will be received in time for an award to be made under the provisions of the bequest by the time of our 1936 convention The committee therefore recommends that an announcement of the nature of the bequest be made at one of the General Sessions of the Portland Convention and at one of the meetings of the Scientific Section and the Section on Practical Pharmacy and Dispensing, respectively The Committee further recommends that if there is to be established in the ASSOCIATION a permanent Commission on Awards, this Commission be instructed

to set up the necessary rules and regulations for carrying out the desires of the donor and that the award be known as the Kilmer Prize "

It is further recommended that notice of the establishment of the Kilmer Prize and rules governing its award be furnished all State Pharmaceutical Associations and other groups of pharmacists whose members may be stimulated to carry on researches along the lines contemplated by Dr Kilmer

No applications for grants from the interest derived from the established funds have been referred to the Committee

In this connection the chairman desires to raise the question as to the scope of the duties of the Committee in the light of our recently acquired building If this Committee is to have charge of the administration of all property" of the ASSOCIATION, as indicated in the By-Laws, it must be looked upon as the Committee on Administration of the headquarters building If, on the other hand, such administration is not contemplated, then the By-Laws should be changed or definitely interpreted on this point At any rate there should be some constituted authority with respect to the management and administration of the building The Council should definitely dispose of this question at once

Following the precedent of former committees we recommend the following banks and safe deposit vaults as depositories for funds, securities and records of the ASSOCIATION

DEPOSITORIES FOR FUNDS

The Baltimore Trust Company, Baltimore, Md
 The Baltimore National Bank, Baltimore, Md
 The Maryland Trust Company, Baltimore, Md
 The Merchants and Newark Trust Co , Newark, N J
 The Boston Penny Savings Bank, Boston, Mass

DEPOSITORIES FOR SECURITIES AND RECORDS

The Baltimore National Bank, Baltimore, Md —Safe Deposit Boxes
 The Maryland Trust Company, Baltimore, Md —Safe Deposit Boxes
 The Merchants and Newark Trust Co , Newark, N J —Safe Deposit Boxes

The report was received and the recommendations taken up seriatim on motion Army—Geo D Beal

Kilmer Prize On Motion of Adams—Christensen, the three recommendations with respect to this prize were approved

Headquarters Building It was moved by DuMez—Army that the administration of this property be under the Committee on Property and Funds in accordance with the By Laws of the Council

Depositories The depositories recommended were approved on motion Eberle—DuMez

The report of the chairman was then approved as a committee report on motion of Army—DuMez

116 Committee on Publications The following report was read by Chairman DuMez

Your Committee on Publications respectfully submits the following report on its activities for the year 1934—1935 and on the status of the publications of the ASSOCIATION

"Journal" The total expenditures for the publication of the JOURNAL for 1934 including the Editor's salary were \$19,236 50 (\$14,236 50 + \$5000 00) This is \$1023 55 more than was expended the preceding year the amount expended for this purpose in 1933 being \$18 212 95 (\$13,212 95 + \$5000 00)

"The receipts of the JOURNAL for advertising, subscriptions, sale of single copies, reprints etc , for 1934 were \$9289 34 which is an increase of \$1389 34 over the preceding year when the receipts were \$7900 00 The subscription credit received from non headquarters building members, less 20% for overhead amounted to \$4235 14 making a total of \$13 524 48 The total receipts for 1933 were \$12 234 26

"The total expenditures of \$19 236 50 less the total receipts of \$13 524 48 give \$5712 02 as the net cost of the JOURNAL for 1934 The net cost for 1933 was \$5978 68 A reduction of \$266 66 was therefore effected in 1934 and is to be attributed mainly to gains made in the sale

of subscriptions to the JOURNAL, single copies, reprints, etc., rather than to an increase in income from advertising

"The contract for publishing the JOURNAL was again awarded to the Mack Printing Company of Easton, Pa., on the basis that the award be made to the lowest bidder, and because of satisfactory service which this firm had given us in the past

"Beginning with the March issue for this year (1935), there has been published monthly in the JOURNAL a section of approximately 36 pages of Pharmaceutical Abstracts. This new feature recommended by the special committee appointed several years ago to study the matter and adopted by the ASSOCIATION in convention last year appears to have been well received by the users of the JOURNAL, if the favorable comments on the new section received by Editor Eberle and your chairman may be used as a basis for forming an opinion. The new arrangement would seem to appeal particularly to teachers and research workers and should result in some increase in the number of JOURNAL subscriptions

"The foregoing constitutes the first step in the inauguration of the new policy of the ASSOCIATION with respect to the publication of the JOURNAL and the YEAR BOOK. We have discontinued the YEAR BOOK as such and have added a section on Pharmaceutical Abstracts to the JOURNAL. The next step is the publication of a new popular type of journal which will appeal to the rank and file. In addition to items of interest to the average pharmacist, such a journal would carry all of the miscellaneous material published in the present journal, thus making available additional space for the publication of scientific and professional papers

"*Year Book* Volumes 21 and 22 of the YEAR BOOK of the ASSOCIATION covering the years 1932 and 1933 have been printed and distributed since the last annual meeting which leaves only the preparation of the report of the Reporter on the Progress of Pharmacy for 1934 to complete the series. The work on the preparation of the latter which will constitute Volume 23 of the series of YEAR BOOKS is more than half completed at this time and it is expected that the book will be ready for distribution about the first of the new year

"The contract for printing, binding and distributing these volumes was again awarded to the Lord Baltimore Press of Baltimore, Maryland, because the estimates of this firm on the cost of doing the work were the lowest in both instances. Two thousand copies of Volume 21 were ordered and 1750 copies of Volume 22. Up to the present time only 1100 copies of the latter have been distributed

"The sum of \$1000.00 to be used in defraying a part of the cost of preparation and publication was again contributed by the Board of Trustees of the United States Pharmacopœial Convention

"Copies of the YEAR BOOKS Nos. 1-5, 7-12 and 14-21, were donated to the Library of Congress by authority of the Council

"*National Formulary V* Up to June 30, 1935 a total of 51,051 copies of the National Formulary V were printed and bound, 50,551 in buckram and 500 in leather. Of the total number of copies bound in buckram 50,000 were sold and 88 were distributed as complimentary copies. Of the copies bound in leather, 103 were sold and 12 were given away. The remaining 463 copies bound in buckram and the 385 copies bound in leather constituted the stock on hand as of June 30, 1935

"Permission to use portions of the text of the National Formulary V for comment in other publications was granted to the following: School of Medicine of Duke University, for use in the preparation of a Hospital Formulary, J. B. Lippincott Co., for the publication of a textbook on prescription writing by Dr. Charles Solomon, Morris Dauer for use in the preparation of a 'Formulary for Physicians'. Permission was granted to the American Medical Association to use portions of the text of the National Formulary VI for comment in 'Useful Drugs,' 'Hospital Practice for Internes' and 'Epitome of the United States Pharmacopœia and the National Formulary'. The foregoing permission was granted with the definite understanding that no comment would be published until after the appearance in print of the new edition of the National Formulary

"The contracting for printing and binding the National Formulary VI was awarded to the Mack Printing Company in August 1933, but no provision for the sale and distribution of the book was made at that time. This matter has, however, been given consideration during the past several months. Invitations were sent out to the publishers qualified to handle the job to submit

estimates on the cost of sale and distribution, and on the basis of the estimates received, the chairman of the Committee on Publications recommended to the Council that the contract be awarded to the Mack Printing Company. A vote has been called for and it is hoped that it will be favorable because there is not much time remaining before the expected date of appearance of the new book.

'Pharmaceutical Recipe Book' Up to June 30, 1935, a total of 5506 copies of the Pharmaceutical Recipe Book were printed and bound in buckram. Of this number 5345 copies were sold, 101 were distributed as complimentary copies and 60 copies remained as stock on hand. Since July 1st, the stock on hand has been sold and the chairman of the Committee on Publications recommended that an additional 125 copies be ordered printed and bound.

"The contract for printing and binding the new edition of the Recipe Book was awarded to the Mack Printing Company as you will recall. The contract for its distribution and sale will be awarded to the firm receiving the contract for the distribution and sale of the National Formulary."

Complete information on the status of revision of the Recipe Book cannot be given you at this time. Suffice it to report that satisfactory progress is being made in the revision, of the formulas and other parts of the text. In fact, Chairman Lascoff of the Committee on Recipe Book contends that, except for some work still to be done on a few formulas and the alteration of certain titles to make them conform to the recommendations of the Food and Drug Administration of the U. S. Department of Agriculture, the book is ready for the printer. That being the case, it is believed that publication will be proceeded with promptly.

The report was received on motion of Fischelis—Geo. D. Beal

117 *Contract for the Distribution and Sale of the N. F. VI and R. B. II* The secretary reported that Motion No. 38 (Council Letter No. 21, page 681) had received a majority vote and that President Fischelis had requested that final action be deferred until this meeting of the Council. After a full discussion, the action of the Council in awarding the contract to the Mack Printing Company, Easton, Pa., was affirmed on motion Beal—Army.

118 *Committee on Year Book* Chairman Geo. D. Beal submitted a verbal report approving the transfer of Pharmaceutical Abstracts to the JOURNAL.

The report was approved on motion Christensen—Kelly

119 *Editor of the Year Book* Editor DuMez read the following report:

Volumes 21 and 22 of the YEAR BOOK covering the years 1932 and 1933, respectively have been published since the meeting held in Washington in May of last year. This leaves one more book still to be prepared to complete the series up to the time when the publication of Pharmaceutical abstracts was begun in the JOURNAL. When this volume is published the YEAR BOOK in its present form will be discontinued. The book in its present form contains some useful features and I have no doubt that its passing will be missed by many. As a vehicle for carrying the report of the Reporter on the Progress of Pharmacy however, it has outlived its usefulness by many years. The large majority of workers who use the material carried in the report of the Reporter on the Progress of Pharmacy want it immediately after the publication of the original article and they are not willing to wait a year or two for it as they have been compelled to do where they have depended upon the YEAR BOOK.

The preparation of this volume which will be the YEAR BOOK for 1934 is well under way. About two thirds of the abstracting has already been done and I have the assurance of my collaborators that the remaining abstracts will be completed within the next 60 days. The book should therefore be ready for distribution sometime in the early part of next year depending on the rapidity with which the printer handles the job.

"The publication of the report of the Reporter on the Progress of Pharmacy in monthly installments in the JOURNAL was begun in March of this year and met with a favorable response immediately, if the letters of commendation I have received may be taken as a true criterion. We began with a staff of 30 abstractors and with the expectation of publishing 32 pages of printed matter each month. The staff has since been increased to 36 abstractors and the number of pages of printed material has been increased to 36. Up to and including the July issue of the JOURNAL a total of 176 pages of Abstracts have been published. It is quite probable that it will be necessary to make another increase in the number of pages published very soon as we are still enlarging our field of the literature that is being covered. If we should undertake to cover thoroughly

some of the fields closely related to pharmacy, the field of cosmetics, for instance, the increase in the number of pages would be very much greater

"While we are on this subject, it may be mentioned that an approach has been made to determine if our ASSOCIATION would be willing to undertake to abstract the literature on cosmetics. The cosmetic industry has grown enormously in the past two decades, and they are searching about for some organization to undertake to do this work for them. It may be that we should give this matter serious consideration at this time.

"In setting up a working arrangement for getting out these monthly Abstracts it was agreed that we would pay the abstractors at the rate of \$2.00 per printed page of abstract made from articles published in English, and \$3.00 per printed page for abstracts of articles published in a foreign language. We did not, however, agree on the time of making payments for the work done. This matter has been brought to my attention by several of our abstractors, it has been discussed with Secretary Kelly and it is recommended that hereafter payments be made quarterly.

"Your attention is also called to the fact that when the Council agreed to discontinue the YEAR BOOK in its present form, it also declared that the ASSOCIATION data, membership rolls and index would be carried in the JOURNAL so that those desiring to do so could bind this material together with the Abstracts and thus continue the series of YEAR BOOKS. This will require a total of approximately 70 pages exclusive of the index. It is recommended that the Editor of the JOURNAL be given authority to proceed with the publication of this material promptly so that the matter of authority will not be a factor in holding up publication at the end of the year."

On motion of Adams—Army, the report was received and the recommendation that the literature on cosmetics be abstracted for publication in connection with the Pharmaceutical Abstracts was referred to the Committee on Cosmetics for investigation and recommendation.

The Incoming Committee on Publications was requested to submit a recommendation with respect to the publication of the ASSOCIATION material including the roll of members, heretofore published in the YEAR BOOK, on motion of Fischelis—Christensen.

120 *Editor of the Journal* Editor Eberle read the following report:

"The report of the Editor herewith deals with the business of 1934 and as report of previous years, is compared with the prior year, 1933.

The expenses of the JOURNAL for 1933 were \$13,212.94, the receipts were \$7900.00. Deducting the receipts, not including membership subscriptions from expenses shows a net cost of \$5312.94. Add the Editor's salary and we have a cost of \$10,312.94. The credit on membership subscriptions, not Headquarters members, less 20% for overhead, which for 1933 is \$4334.26 from the gross cost, \$10,312.94, leaves \$5978.68 net cost, including the Editor's salary.

"The total expenditures for the publication of the JOURNAL, for 1934, including the Editor's salary, were \$19,236.50 (\$14,236.50 + \$5000.00). The total expenditures for 1933 were \$18,212.94 (\$13,212.94 + \$5000.00), which represents an increase of expenditures for 1934 of \$1023.56.

"The receipts of the JOURNAL for advertising, subscriptions, sales of single copies, reprints, etc., for 1934, were \$9289.34. The subscription credit received for 1934 non-headquarters building members, less 20% for overhead, amounted to \$4235.14 making a total of \$13,524.48. The total receipts for 1933 were \$12,234.26. The receipts for 1934 have, therefore, increased by \$1290.22.

The total expenditures for 1934 of \$19,236.50, less the receipts of \$13,524.48 show the net cost of the JOURNAL for 1934 to be \$5712.02. The net cost for 1933 was \$5978.68. The net cost of the JOURNAL has, therefore, decreased by \$266.66 in 1934 over the preceding year (1933).

'The number of pages in 1933 was 1310, in 1934, 1256. The publication costs in 1933, \$9107.44, in 1934, \$9300.13. Mailing costs of the JOURNAL in 1933, \$599.51, in 1934, \$572.45, mailing back numbers of the JOURNAL for 1933, \$26.50, in 1934, \$31.20. Engravings and photographs, other than included in Mack Printing Company account in 1933, \$387.06, in 1934, \$552.39. Binding JOURNALS in 1933, \$25.75, in 1934, \$21.00, stationery and office supplies in 1933, \$69.20, in 1934, \$214.62, clerical, in 1933, \$1242.00, in 1934, \$1173.00. Commissions on advertising in 1933, \$488.22, in 1934, \$407.41. Small miscellaneous items make up the remainder of the total expenses.

"Detailed comparative receipts 1933 and 1934. The receipts for 1933, \$7900.00, for 1934, \$9289.34. Advertising in 1933 brought \$5241.92, in 1934, \$4942.29. Subscriptions in 1933 amounted to \$903.53, in 1934, \$1216.26, it should be understood that we make every effort possible to bring subscriptions to memberships. Single copies in 1933, \$28.51, in 1934, \$73.51. Re

prints, in 1933, brought \$1038 79, in 1934, \$834 05, Professional Pharmacy, \$1596 66, Miscellaneous items amounted to \$687 25 in 1933, in 1934, \$637 15. The American Association of Colleges of Pharmacy contributed \$300 00 in 1933 and the same amount in 1934. The Conference of Pharmaceutical Association Secretaries contributed \$25 00 in 1933 toward the expenses of printing their minutes in the JOURNAL and a like contribution was made in 1934. The Conference of Law Enforcement Officials contributed \$75 00 in 1933 and \$50 00 in 1934.

"A number of reproductions of pictures and hooks have been made without cost to the JOURNAL and ASSOCIATION, and the sum derived from the sales of these was contributed to the JOURNAL—"The Laboratory," "Dr Power in His Laboratory," "Ground Breaking at Headquarters" Proof Sheets of United States Pharmacopœia I, "New Nomenclature."

"In recent years the papers presented to the Sections have increased in number and some in the pages of the reports, as a result we had quite a number of unpublished papers, most of which have now been published.

As stated in the last report, among the papers in recent years have been those presented in partial fulfillment of work for degrees. As then stated, it has occurred to the Editor that part of the expenses for papers of that type should be met by the authors. There are two sides to the question, of course. Another expense that should, perhaps in part be met by authors is when a large number of cuts are used. Tabular matter should be summarized to an extent. The JOURNAL has carried the expense of having reprints made of reports and minutes of meetings in connection with the annual convention for distribution at the sessions of the ASSOCIATION and for pharmaceutical publications. Also, abstracts have been mimeographed for like distribution, more than one hundred have been prepared.

"A work of interest and value has been published, 'The Professional Pharmacy—An Analysis of Prescription Department Activities,' by Frank A. Delgado and Arthur Kimball. It is part of the National Drug Stores Survey and published under and by authority of the U. S. Department of Commerce, Bureau of Foreign and Domestic Commerce. Ten thousand copies of these have been published and sold and the amount received has paid for making them, and also for publication costs. Fine publicity has been given by most of the pharmaceutical publications. A revision of Professional Pharmacy is in process.

"The contribution of the American Association of Colleges of Pharmacy is appreciated and thanks are extended to Dean C. B. Jordan, editor of the Department, for his cooperation. Also to the Conference of Pharmaceutical Association Secretaries and Conference of Law Enforcement Officials.

"On account of the code the printing cost of the JOURNAL was increased by nearly 10%. The Editor advised the Publication Committee to this effect in the monthly report for June 1934, and again in the July report 1934 after investigation that it was necessary to comply with the code and further advising that under these rates the publication costs for the June issue were \$905 12 against \$976 51 somewhat less than 10%. The code costs have been kept up since then. Another item that changed the cost slightly up to June 1935—Mack Printing Company gave us the advantage of their old price on cover stock. The supply was exhausted with the June issue so that we are now paying \$3 20 per month more for covers. There has been a slight increase in engravers' prices however their prices were adopted before the code went into effect (in 1932).

As stated we have been watching the corners so that the net costs as shown by the report were slightly less in 1934 than in the previous year, however, those of the first six months of 1935, due largely to the code are \$295 98 greater than up to July 1, 1934.

"The Abstract Section cost of the JOURNAL has averaged about \$230 00, however, this does not take into account the higher mailing cost, some of the engravers' plates of the Abstract Section and other minor items, which we did not think of sufficient importance to detail as after all it is ASSOCIATION cost. We are confident from corresponding that the Abstract Section has met with favor. We wish to thank Editor DuMez for the fine cooperation he and his co-workers have given us and also the Mack Printing Company.

"Extended detail would increase the length of this report. The report of the Editor is made monthly to the Publication Committee annually a scheduled report is made of Receipts and Expenses, Itemized Reports are given to the secretary for the Auditor's Report and all bills are receipted before going to the secretary.

"The Editor is thankful for the fine coöperation given him."

On motion Adams—Army, the report was received and discussion of it deferred until the afternoon session

Later, the report was approved on motion Adams—Army

121 *Committee on National Formulary* The following report was read by Chairman Gathercoal

"Progress of the Revision —The copy for the page proof has been largely completed and forwarded to the printer. The page proof, in 64-page forms, is being issued, and we trust will be distributed by the first of September. The page proof represents the completed copy of the Revision, with the exception of a few monographs in the Tablets, possibly one ointment monograph, the section on General Tests, Reagents, etc (which is largely referred to the similar section in the U S P XI), and the Index. It is expected that these unfinished portions will be ready by the first of September, or as soon as the U S P page proof has advanced to the point where we can use it for reference purposes

"We have published more than 500 pages in the N F Bulletin and the Sub-committee Letters during the past year. A very large amount of correspondence has been handled, and we have completed the reading of the corrected galley proof

'The galley proof first began to appear in December 1934, and was completed in June 1935. The galley proof was distributed according to the Sub-committee assignments. For example, all of the galley of the crude drug monographs was distributed to Sub committee No. 1 on Pharmacognosy, including the auxiliary members and all of those who had had any part in the preparation of the monographs. Likewise, the chemical monographs went to Sub committee No. 2 and all who were particularly interested in the chemistry of the N F. In this way, all of those who were interested in any particular phase of the work had opportunity to carefully scrutinize that portion of the galley proof in which they were best trained. Of course all of the *Committee members* received the entire galley proof

"The returns from the galley proof were unusually good. We kept a record of that which was sent out and returned, and found that the returns were fully 90 per cent. Many of the returns had been very carefully read, many of them contained valuable criticisms and some of them many valuable criticisms. All told about 7000 criticisms were returned on the galley proof. The chairman and his secretary carefully reviewed every one of these, and we were able to use about half of them. The result of these criticisms was a markedly improved text even though we felt that the text was as perfect as we could make it before it went into galley

"In view of the fact that such abundant opportunity has been given for criticism, not only as regards the accuracy of the statements, but also as regards opinions on policy and suggestions on improved methods, we are restricting criticism on the page proof purely to matters of accuracy, and intend to make no changes that are not called for except for absolute corrections of error

"Financial Statement for the Year —The summary of the financial statement for the year is attached

NATIONAL FORMULARY COMMITTEE EXPENSES

July 1, 1934—June 30, 1935

Total, \$2716 85

<i>Bulletin & Sub-committee Letters</i>	\$738 22

The increase in the membership of the Committee to twenty is not requisite. Perhaps a decrease in membership to but ten would be more desirable with the appointment of one new member each year, or allow the membership to remain at fifteen and appoint one new member one year and two members the next.

' The following items should be considered in connection with the election of this committee.

' 1 Each committeeman should be chosen for ability to assume a definite assignment of the work or be a specialist in a particular phase of the work. Some consideration should be given to the geographical distribution according to type of institutions represented in the membership of the ASSOCIATION.

2 Provision should be made to retire any member of the Committee who is not willing or able to give full and careful attention to his duties in connection with the Committee work.

'3 Provision should be made to hold a meeting of the Committee at least once each year perhaps in connection with the annual meeting of the ASSOCIATION.

4 No salary should be paid to the Committee members but a policy of paying the necessary expenses of conducting the Committee work including the expense of individual members for attendance at the annual meeting of the Committee, should be manifested. If it be possible to pay a suitable honorarium at the time of retirement such a policy would be in order. An annual budget for the committee expenses should be prepared and presented to the Committee.

' The National Formulary is a great financial asset of the AMERICAN PHARMACEUTICAL ASSOCIATION. The financial value of this book can be materially increased provided due attention is given to its revision and to the development of its sale. The Council of the AMERICAN PHARMACEUTICAL ASSOCIATION should originate and definitely approve of policies looking to the continued development of this book leading to its increased popularity and sale. These policies and

principles of revision should be given to the Committee for its guidance and with the definite understanding that they are to be followed

"A few of the great questions of policy that the Council should now consider and definitely pass upon are as follows

"1 What is the purpose of the National Formulary? It was at first purely a retail pharmacist's formulary. An attempt was made to interest physicians in it, but there was nothing there to interest them and, even after fifty years, they have not become interested in it. It became a legal standard and this phase has been extensively developed. Now, however, it has lost much of its interest to the practicing pharmacist because of this legal development. How can it be made a complete legal standard (a necessity under the law) and, at the same time regain the interest of the pharmacist and acquire the interest of the physician? It is of great interest to the manufacturing pharmacist and as a textbook in the pharmacy colleges

"2 On what basis shall admissions be made to the National Formulary? Admissions never have been on a therapeutic basis, though perhaps nearer to it in this present revision than heretofore. The physician desires the National Formulary to assume such responsibility. Shall we do so? Admissions in earlier editions were exclusively preparations with working formulas, then non U S P simples used in National Formulary formulas were admitted and standardized, now non-U S P simples not used in National Formulary formulas are admitted and standardized. Are these correct policies? What shall be the new policies? Shall we admit formulas that provide substitutes for proprietary preparations? These are what the pharmacists want. Shall we admit the newest discoveries of simples and preparations? These are what the physician wants. Shall we admit new items annually and drop them if they fail to attain popularity with physicians? Shall we endeavor to develop new preparations and popularize them with physicians by advertising? Or must we always wait until the manufacturer has developed the preparation and popularized it before it can be 'officialized'?

It would seem desirable that the AMERICAN PHARMACEUTICAL ASSOCIATION Council, a body elected by the ASSOCIATION and representative of all phases of the A P H A membership should assume responsibility for answering these questions and many others of a similar nature

RECOMMENDATIONS

I Election of the Committee Members—A recommendation is made that the National Formulary Committee be increased to 20 members and that two members be elected each year to serve for 10-year terms. The Committee would then be a continuous body and there would be no abrupt change in policies and methods with the election of an entirely new committee as occurs under the present system. This new policy as regards the election of Committee members seems to be especially desirable in view of a gradual change in policy as regards the revision work. This change involves the issue of supplements and perhaps a new edition of the book itself more frequently than decennially

II Council Supervision of the N F Revision—The Council should maintain a somewhat closer supervision over the work of Revision and should take a greater responsibility for the revision. This perhaps can be done by reviewing annually and approving or re approving the General Principles of Revision for the guidance of the Committee

"III Continuance of the N F Revision Activities—It is recommended that the Council adopt a policy to the effect that the N F Committee continue an earnest and constructive study of the problems that have arisen in connection with the present revision, and that so far as possible these studies be expressed in supplements to the N F

'It is suggested that each sub committee (possibly reorganized) be urged to continue the study of definite problems. A few of these may be outlined as follows

' Sub-committee No. 1 (Pharmacognosy)

'(1) A careful review and consideration of each new vegetable or animal drug that is presented in the current literature for its possibilities as an official item

"(2) A study of the amount of foreign organic matter that is present commercially in each official crude drug

"(3) A careful review of the work done by Dr Newcomb on the inorganic matter in crude drugs, and a recheck of the inorganic matter in commercial crude drugs of to day

(4) A careful checkup of the official description of the crude drug and its structure as well as the diagnostic features of the powder

"(5) The evaluation of crude drugs by their volatile constituents, as determined by distillation "

' Sub committee No 2 (Chemicals)

' (1) Determine a permissible extent of moisture for each of the N F chemicals

"(2) Determine the approximate solubilities of each of the N F chemicals in a wider range of solvents

"(3) Study the N F organic chemicals for readily carbonizable substances

"(4) Study the N F organic chemicals for residue after ignition

'(5) Check all of the N F tests for identity and purity on commercial samples

' (6) Review and carefully consider each chemical that is presented in the current literature for its possibilities as an official item, for example, Colloidal Kaolin "

' Sub committee No 3 (Solution Preparations)

(1) The prevention of precipitation in elixirs

"(2) The preparation of elixirs by percolation

"(3) The possibility of preparing desirable liquid preparations of new chemicals that appear in the literature

"(4) A careful study of fruit syrups

"(5) A careful study of assays in connection with elixirs, solutions, syrups, etc

"(6) A careful check on present descriptions, tests and assay processes

"(7) A careful study of the new pepsin elixir monographs

(8) A study of Syrup of Glycyrrhizin "

"Sub committee No 4 (Extractive Preparations)

"(1) The application of Dr Husa's results on the official extractive preparations

"(2) Why have the extractive preparations lost their popularity with physicians?

' (3) Standardization of 'extractive' in these preparations

"(4) Standardization of color, odor and taste in these preparations

(5) Tests of identity of these preparations "

Sub committee No 5 (Preparations for Internal Use)

"(1) Are there other effervescent salts that should be made official?

"(2) Are there alkalizing powders that should be made official?

' (3) Are there not many troches or candy tablets that might be considered for official standardization, such as phenolphthalein candy, etc

' (4) Shall capsule preparations be made official?

'(5) Assays of effervescent and non effervescent salts "

"Sub committee No 6 (External Preparations)

"(1) A study of dusting powders, douche powders and ointments from the antiseptic standpoint (Dr Kelly's foot powder)

"(2) The use of antiseptic dyes in ointments and solutions

"(3) Study the popularization of liquid and solid petroxolin as the basis of medication for external use

"(4) Study ointments and ointment bases especially in regard to the effect of varying temperatures and in regard to absorbability into the skin "

"Sub-committee No 7 (Miscellaneous Preparations)

"(1) Investigation of radium preparations

"(2) Investigation of sprays, inhalents and nose drops

'(3) Study the vitamin assays of cod liver oil emulsions

"(4) Study the colloidal character of phenolphthalein in liquid petrolatum emulsion "

"Sub-committee on Ampuls

"(1) Study carefully tests for the identity and purity of ampul solutions

(2) Study the sterility of ampul solutions

(3) Study preservatives, buffers and hydrogen ion concentration in ampul solutions "

"Sub committee on Tablets

(1) Study tests for the identity and purity of tablets

'(2) Study the general monograph for tablets including coatings, diluents, colorings, adhesives, etc

"(3) Study the solubilities of tablets, especially the test for the solubility of enteric coated tablets

"(4) Develop assays for popular tablets not now official "

'Sub-committee on Dental Products

'(1) Which products that are used by dentists in their practice or that can be prescribed by dentists for use by the patient are suitable for official standardization?

"(2) What standards are necessary for such products?"

"Sub committee on Veterinary Products

"(1) Which products that are used by veterinarians in their practice or that can be prescribed by veterinarians are suitable for official standardization?

(2) What standards are suitable for such products?"

'Special Sub-committee on Glandular Products

'(1) A study of assays for these products

'(2) A careful checkup of the histological features of these products

(3) A study of commercial products for adulterations

'(4) A study of these products for sterility "

"General Studies

(1) The scientific naming of colors as used in the U S P and N F in connection with crude drugs chemicals, preparations, tests etc

'(2) A comparative study of chemical assays of the same general nature

'(3) A careful study and checkup on all of the samples of the U S P and the N F to determine the possibility of presenting these samples in suitable preparations for the physicians' use, for example Solution and Ointment of Acriflavine (Dr DuMez, 4 9 35)

(4) A careful study and checkup on all of the titles and synonyms of the N F especially in view of the suggestions made by Dr A G Murray

'(5) A careful check of the alcohol content of all preparations containing alcohol "

"IV *The National Formulary Bulletin*—If the Council endorses the preceding recommendations, your chairman plans to carry on the National Formulary Bulletin. It is now approaching the completion of its fifth volume that is, 2500 mimeographed pages. To provide for the issuance of this Bulletin and the correspondence in connection with the continuance of the N F Revision, it will be necessary for the chairman to be provided with a secretary. Miss Edith Smith, who has served as secretary for nearly two years, has been highly efficient and because of her constantly increasing knowledge of the details of this work becomes increasingly more valuable. I would recommend that she be retained for the ensuing year at a salary of \$1000.00 payable monthly."

"V *N F Laboratory Work*—If the studies outlined in Recommendation III are to be properly carried out, a laboratory should be established at once where much of the control work could be handled. We can establish such a laboratory at the College of Pharmacy without charge so far as rental, heat, light, etc. is concerned. It may be possible to obtain the services of a capa-

ble pharmaceutical chemist for part time at a cost of not more than \$100 00 per month It would be necessary to provide the reagent supplies as well as to provide commercial samples, etc It is also possible that we may be able to obtain the services of two or three capable chemists through public works money Also research work can be assigned to graduate students in various institutions The laboratory space in mind is equipped so that four men can work together very comfortably It is recommended that the Council provide for such a laboratory until facilities can be provided at the A P H A building in Washington "

"VI N F Publicity—The popularization of the National Formulary to pharmacists and physicians is very important This should be directly in charge of an A P H A publicity director A reasonable percentage of the gross receipts from the sale of the A P H A publications should be set aside for this purpose The publicity should take the form of exhibits at Conventions, of 'U S P and N F propaganda' of JOURNAL articles, of addresses at meetings of physicians and of pharmacists and in various other ways that will develop "

VII Honoraria to Committeemen—While it is a well recognized maxim that voluntary service, such as has been given in connection with the U S P and the N F revision work, can never be paid for in dollars and cents, yet it is also true that a monetary token of appreciation is always acceptable and so far as I know is never declined Such tokens will be especially effective in stimulating renewed interest in N F revision, if these preceding recommendations be adopted It is therefore recommended that honoraria be paid to the members of the National Formulary Revision Committee, based to an extent at least, on the amount of work that they have been called upon to do or to supervise and to an extent on the faithfulness with which this work has been done "

The report was received and consideration of the recommendations deferred to the afternoon session on motion Army—Geo D Beal See Item No 126

The meeting then adjourned until 2 30 P M

* * * * *

The afternoon meeting was called to order at 2 40 P M with the same attendance as in the morning session

122 Committee on Recipe Book In the absence of Chairman Lascoff who sent a message of regret that he could not be present the following report was read by the secretary

Your chairman begs to submit the following report on the Recipe Book for the year 1934-1935

'The success of the second edition of the Recipe Book seems well assured because of the frequent calls for Recipe Book No 1 When the original printing of 5000 copies had been exhausted in March 1934 the second series Series B, consisting of 500 copies was printed Early in July the publishers reported that they were entirely out of stock and that they had called in all stock from depositories which had also been used We are receiving inquiries daily as to when the new Recipe Book will be completed We expect that it will be ready by January 1, 1936 if not sooner In the meantime your chairman has deemed it advisable to have another series Series C printed, consisting of 125 copies in order to care for the present demand We are also accepting advance orders for the second edition

'Great strides in the progress of the second edition have been made since the work of revision was begun in 1932-1933 The first two years were concentrated on the collecting of new formulas This past year the suggestions and efforts of the Committee and your Chairman with the assistance of Mrs Kassner have been centered on correcting the typographical errors in the first edition, deleting superfluous conflicting or duplicated material experimenting with the new formulas that were submitted to be sure that they were workable, transposing proprietary names to their chemical equivalents

'It is no exaggeration to state that to day the pharmacist purchases at least 75% of his U S P and N F galenicals from manufacturers The former cannot purchase from the manufacturer however the galenicals of deleted formulas from old editions These must be prepared by the pharmacist For this purpose the Recipe Book supplies the formula he needs

Deletions—In the new Recipe Book we shall drop any preparations which will be included in the N F VI Your chairman is checking very carefully to be sure that there is no duplication The most valuable formulas deleted from old U S P s and N F 's will remain In

this way, one book of reference in the prescription pharmacy takes the place of several old editions

"Hospital Formulas"—Physicians frequently keep in their minds formulas used in their own particular hospitals and prescribe such formulas. In Recipe Book No 1, the Pharmaceutical Formulas are in Part I and the Hospital Formulas are in Part II. In the new Recipe Book, we have included the Pharmaceutical and Hospital Formulas in one part. All of the formulas are arranged in alphabetical order under English titles. Preparations of one kind are grouped together. The Hospital Formulas are designated as such.

'Bulletins'—After my last report of 1933-1934, additional bulletins were mailed. Up to the present writing, thirty-four bulletins have been mailed. These new bulletins, proposed in total 352 new formulas, in addition to 21 new veterinary formulas. The 352 new formulas consist of

Pharmaceutical Formulas (including Hospital)	Diagnostic Reagent Formulas
Cosmetic Formulas	Dental Formulas
Flavoring Extracts (Vehicles)	Photographic Formulas
Technical Formulas	Veterinary Formulas

"In addition to the foregoing, we also had bulletins on 'Treatments and Antidotes,' 'Table of Solubilities,' 'Latin Abbreviations' and 'Doses.' A new section was written on Sterilization, in accordance with the latest data obtainable.

"The following is a condensed report of the bulletins that were mailed since the last meeting

'Early in November 1934, the following bulletins were mailed

Bulletin No 20—Treatments and Antidotes for Poisoning

Bulletin No 21—Table of Solubilities

Bulletin No 22—Four Questions Pertaining to the Two Previous Bulletins

"The mailing of all Bulletins, brings forth a great many suggestions from the members. However, it would take too much time and space to enumerate all the various comments. We will, therefore, endeavor to present a summary of the results in each case.

"Some members felt that 'Emergency Treatment' or 'First Aid Treatment of Cases of Poisoning' would be a better title for Bulletin No 20. Some suggestions were made on additional poisons and their treatment, such as mineral acids, carbonic acid, cresol, lysol, illuminating gas etc. The 'Treatment and Antidotes for Poisoning' will appear in Recipe Book No 2.

'Eleven members favored accepting 'Table of Solubilities,' while E. N. Gathercoal, among others, felt that the Table should be reasonably 'complete' before inclusion. This Table will not appear in the new Edition of the Book. 'Latin Abbreviations' will not be included in the new Book.

"Bulletin No 23, also sent out in November 1934, consisted of 128 N. F. V. Deletions (b). The Committee members favored the inclusion of only a few of the deleted N. F. Formulas. L. D. Havenhill felt that the Recipe Book should not include remedies which have gradually passed out of use, unless the preparations are used regularly and there is a demand for them.

'Bulletin No 24 was sent out at the same time. In this bulletin were three formulas suggested by L. D. Havenhill which were accepted by the members.

Bulletin No 25 consisted of 13 new formulas, suggested by W. L. Scoville. With one or two objections, the Committee voted to include all these new formulas.

Bulletin No 26 presented one new formula and also inquired as to the advisability of including all the formulas for Whitfield's Ointment. We have since been advised that this formula will appear in N. F. VI.

Bulletin No 27 consisted of 5 new formulas suggested by S. L. Hilton. All were accepted with the exception of Ephedrine Solution of Water and Compound Solution of Ephedrine (in oil), which will appear in N. F. VI.

'Bulletin No 28—Three new pharmaceutical formulas. All were unanimously accepted.

"Bulletin No 29—This bulletin included a list of 'Average Doses of Unofficial Drugs,' which was unanimously accepted.

'Bulletin No 30—This bulletin consisted of the 'Report of the Conference of Part of Recipe Book Revision Committee, held February 25, 1935.' Your chairman feels that it is proper to include this report herewith.

REPORT OF CONFERENCE OF PART OF RECIPE BOOK REVISION COMMITTEE HELD FEBRUARY 25,
1935

Present J L Lascoff, *Chairman*, H V Arny, E F Cook, R P Fischelis, E N Gathercoal, E F Kelly, C P Wimmer and Mrs E W Kassner

The following recommendations were made

1 All pharmaceutical and hospital formulas should be arranged in one section entitled 'Pharmaceutical Formulas including Hospital Formulas,' with a statement to the effect that formulas in Part II of R B No 1 are contained therein

All formulas should be arranged in alphabetical order under English titles All preparations of one kind being grouped together and hospital formulas being designated as such

2 (1) Formulas having titles the same as, or very similar to some N F VI preparations Of these 31 should be deleted as being too similar to N F formulas 12 should remain in the Recipe Book under new names giving the former name as a synonym and 11 should remain as their titles were not sufficiently like those of N F VI to cause any trouble

(2) Formulas having so-called 'therapeutic' titles, referring to some disease or condition or titles attributing certain properties to the preparation

A list of all these should be sent to E F Kelly who would ascertain whether or not such titles would be considered objectionable If it became necessary, titles should be changed

(3) Insecticides E F Kelly should be asked to take up this manner with the proper authorities in order to ascertain the requirements of Federal and State laws

3 General monographs at heads of sections e g Ampuls, Emulsions, etc

In case of Ampuls some general principles (quoted from N F VI) should be laid down and page references should be made to N F VI for details regarding sterilization etc That in the case of Emulsions and Elixirs information should be given, but in the case of Tablets be deleted E F Cook undertook to supply the text from U S P XI regarding Emulsions

4 Type Process for Tinctures, etc These should be quoted in full at the beginning of the section

5 Sterilization That in the case of ampuls, etc, page reference should be made to N F VI For Gray Oil page 82 the words 'prepare aseptically' should be inserted

6 Doses Missing That a list of these should be sent to E N Gathercoal who would get them filled in

7 Galenicals listed as ingredients in R B Formulas, but now deleted from U S P and N F That these should be included in the Recipe Book and when occurring as ingredients should be designated 'R B'

8 That all drugs, chemicals and preparations named in formulas if official under these names in the U S P or N F are intended to be according to U S P or N F specifications This covers cases of certain substances being either crystalline or anhydrous, strengths of certain solutions, etc

9 Trade marked names That preparations containing ingredients having trade marked names should be deleted E F Kelly was asked to ascertain whether or not certain substances were trade marked That in the case of Photographic Formulas, formulas containing such ingredients should be left as they are

10 (1) Surgical Dressings That this section should be deleted

(2) Dental Formulas That these should await action from the American Dental Association

(3) Laboratory Reagents That this section with 15 new formulas and with all formulas appearing in N F VI deleted, was all right

(4) Veterinary Formulas E N Gathercoal undertook to send these to an authority for revision

(5) Photographic Formulas That L A Becker should be asked to revise this section

(6) Cosmetic Formulas C P Wimmer undertook to revise this section E F Kelly undertook to ascertain, after the former's revision, whether any ingredients could be considered objectionable

(7) Flavoring Agents That the latest circular on standards be obtained and the section revised from this

(5) Technical and Miscellaneous Formulas That no special revision of these was needed

It was suggested that Dr Pantus and Dr Eggleston be approached with a view to obtaining information from them for a new section on *Vehicles*

11 (1) New Formulas That these should be included if voted for by a majority the second time

(2) Whitfield's Ointments That the present formula should be omitted and that the formula 25 (6), should be included under the title of "Modified Whitfield's Ointment" or "Whitfield's Ointment with Thymol"

(3) Poisons Table That this should be accepted for inclusion after being referred to a toxicologist Dr Ischels undertook to hand the material over to some suitable individual

(4) N F Deletions That bearing in mind the 3 previous votes of the committee and the vote of the retail pharmacists, Chairman Lascoff should compile a list of 30 of these for inclusion in R B No 2 and that they should be submitted to the committee as a bulletin

12 Table of Doses That trade marked items should remain on this list That the doses should be carefully checked (1) from Gutman's book (2) by E F Kelly setting some one to write to manufacturers asking them to check up on their own items That the avenue of entrance into the body should be stated

13 Table of Solubilities That this should not be included

Additional Formulas for Inclusion by Chairman Lascoff That formulas for—

White Lotion Magma (experimented) OK

White Lotion Ointment (experimented) OK

Whitfield's Solution (experimented) OK

Mercuric Salicylate, Sterile Suspension of Nose Drops of the ordinary and emulsion type should be included in the new edition

Preparations for the Hair That all formulas containing mercury, arsenic or lead salts as ingredients should be deleted

All the recommendations made in the foregoing report have been taken care of

"Bulletin No 31, mailed May 1935 contained 57 miscellaneous pharmaceutical formulas These were generally accepted

' Bulletin No 32 mailed June 1935, contained new cosmetic and photographic formulas It also had comments from the Council on Dental Therapeutics of the American Dental Association

Bulletin No 33 contained corrected formulas vehicles such as flavoring and coloring agents

' Bulletin No 34 contained four formulas for Ampuls All of the bulletins were generally accepted by the members

In order to clear up some of the questionable formulas of previous bulletins, and to clarify the voting possibilities, the series of 'F' Bulletins was issued for a final vote There were 12 of such bulletins Each of the first three contained sixteen miscellaneous formulas

Bulletin 4F—List of 'Treatments and Antidotes

' Bulletin 5F—Diagnostic Reagents

' Bulletin 6F—N F V deletions

Bulletin 7F—Dental Formulas

Bulletin 8F—Dental formulas

' Bulletin 9F—Pharmaceutical Formulas (eight) and a question

' Bulletin 10F—Pharmaceutical Formulas

Bulletin 11F—13 Hospital formulas

Bulletin 12F—List of U S P deletions not included in the N F VI and admitted to the Recipe Book No 2 and a list of 30 formulas chosen from the 290 formulas deleted from N F VI

"Several members suggested the inclusion of the entire list of these deletions, others suggested discarding the entire list It was finally decided to accept 30 of these formulas and they will be included

The following is a condensed report on the 'F' Bulletins

'On November 30, 1934, Bulletin 1F was mailed, consisting of 16 formulas selected from

previous Bulletins No 1 and No 2, on which there had been some hesitancy about including The final voting showed a majority favoring inclusion of all the formulas submitted, with the exception of the Palatable Castor Oil' formula in Bulletin No 2

On December 15, 1934, Bulletins 2F and 3F (16 formulas each) were mailed These were continuations of Bulletin 1F with final votes desired for additional doubtful formulas They were generally accepted with a few suggestions on directions and title changes

'On January 10 1935, Bulletin 4F, consisting of Poisons and Antidotes, and Bulletin 5F Laboratory Reagents, were mailed The majority of the members favored the inclusion of Bulletin 4F Bulletin 5F was favorably voted upon E F Cook made the suggestions that E N Gathercoal be consulted on this Bulletin as he felt that the N F VI would include a great many of these reagents

Bulletin 6F consisted of the list of N F Deletions

On January 18 1935 Bulletins 7F, 8F and 9F were mailed The first two, containing the Dental Formulas were generally accepted, with some changes in directions Bulletin 9F again presented the problem of Whitfield's Ointment, which it was later learned, would be included in N F VI This bulletin also contained the Seborrheal Dermatitis' formula, and the title 'Compound Naphthalan Ointment' was suggested However inasmuch as Naphthalan is a proprietary name, it was deemed advisable not to include this formula

'On February 7, 1935 Bulletin 10F consisting of 12 miscellaneous pharmaceutical formulas, and Bulletin 11F, consisting of 13 Hospital and Cosmetic Formulas, were mailed Bulletin 10F included a preference in the two formulas of Surgeon's Lubricating Jelly and the Stain for Acid Proofing Laboratory Desks This Bulletin received a majority of votes for the newer formula (Bulletin 27-2) and a majority vote for the old formula of the Stain as it now appears in Recipe Book No 1 In Bulletin 11F, most of the committee preferred the Ephedrine Menthol Spray with the liquid Petrolatum, although Dr Hilton expects to see a similar formula in N F VI Messrs Thum, Glover, Havenhill and Gray suggest mixing the cottonseed oil with the petrolatum The other formulas were accepted

On February 14 1935, Bulletin 6F was mailed, asking the members which of the N F Deletions they voted to include in Recipe Book No 2 This bulletin was the result of a letter listing the N F Deletions which was mailed to prominent pharmacists in various important cities of the United States They were asked to check their lists for the items for which there was a demand in their prescription department Bulletin 6F showed on a separate list the result of these letters Although a few of the members wished to include all of the N F V deletions, in order to have a positive source of information, a number of the members voted for the inclusion of only a few of the formulas C P Wimmer remarked that the vote of the retail pharmacist should be taken as conclusive as to what is useful in the list of deletions Later, the members approved the action taken at the February meeting with reference to the list of U S P and N F deletions to be included in Recipe Book No 2

'In March 1935, Bulletin 12F was mailed, consisting of a list of the U S P deletions not included in the N F VI and admitted to the Recipe Book No 2 and a list of 30 formulas chosen from the 290 formulas deleted from N F VI which were finally accepted

'Out of the 248 original formulas submitted in the years 1932-33-34-35, it was voted to adopt 142 formulas for inclusion in Recipe Book No 2 The others were not adopted either because they already were in Recipe Book No 1 or they would appear in N F VI

Revision—In conclusion, may your chairman state that the following has been accomplished in the matter of Revision

- '1 Pharmaceutical and Hospital Formulas combined into one Part of the Book
- 2 Revised list of First Aid Kits—reference—Johnson and Johnson, Bauer and Black
- 3 Photographic Section—new formulas submitted by Mr Becker

'4 Methods of Sterilization—as submitted by John C Krantz Jr (assisted by Dr Perry) This seems to have enough of an authoritative source

'5 Sections on Vehicles—These were suggested by your chairman to Dr Eggleston who published them in his *Essentials of Prescription Writing* We are using this information through the courtesy of W B Saunders & Co, publishers

- '6 Treatments and Antidotes for Poisons—revised and taken care of by R P Fischels

' 7 Titles—the revision of objectionable titles with the able assistance of Dr Dunbar, of the Food and Drug Administration

"8 Dental Formulas—with their corrections and suggestions of the American Dental Association

' 9 Veterinary Formulas—with the aid of Dr Bergman, chairman of the American Veterinary Medical Association

' 10 N F Deletions—of which 30 were finally selected "

In addition to the above, all parts of the Book have been carefully revised and corrected where necessary

It is with deep regret that I mention here the death of Dr F B Kilmer. He was one of our very earnest workers, faithfully replying to every bulletin mailed to him. He submitted many new formulas, and offered many valuable comments and suggestions, not only for Recipe Book No 1, but also for Recipe Book No 2. The Committee has sustained a great loss by his death.

Your chairman wishes to take this opportunity to express his personal thanks and appreciation for the untiring and responsive efforts of those members of his Committee who have served well.

There were several criticisms received from one or two members of the Committee who claimed that the Recipe Book should contain pharmaceutical formulas only and nothing else. It was our intention to have this book be one of ready reference for the pharmacist. Your chairman receives innumerable requests for formulas of all kinds, and the Recipe Book has been an invaluable aid to him in complying with these requests.

Mrs Kassner and Dr Gathercoal were very helpful to the Committee and I wish to thank them sincerely for their cooperation.

E F Kelly and E G Eberle have been very kind in offering their services, sending out the bulletins direct from their office, after Mrs Kassner left for Europe. My heartfelt appreciation goes to them.

It is the personal opinion of your chairman that when this Book is completed, it will be one of the best reference books on Pharmaceutical formulas, which we have to day.

On motion of Arny—Christensen, the report was received and the chairman was requested to supply galley proofs of R B II to the members of the Council. See Item No 126.

123 Publications. President Fischelis suggested the advisability of carefully considering the entire list of publications of the Association and referred to the relation of the Reference Library and Historical Museum of the American Institute of Pharmacy to these publications, which is closer in the case of the Library.

It is important to decide what services the Library is to offer. It should be a source through a condensed index, of information as to where literature is available rather than an attempt to duplicate all of such literature. Among many other possible services, the Library might furnish collections of books and pamphlets for the use of research and other workers.

President Fischelis expressed the belief that some one should supervise the publications—a Director of Publihty—and that the editorial and business management should be separate.

It is possible to make the present JOURNAL serviceable to pharmacists generally without interfering with its value as a scientific publication. Reference was made to the publications of other associations and to the need on our part for a popular type publication to be issued more generally than the JOURNAL.

President Fischelis recommended that a decision as to the policy to be followed, be reached promptly.

A general discussion followed the result of which was an agreement of opinion that the JOURNAL should be continued with such changes as may be found advisable and that steps should be taken promptly to establish a popular publication which will be furnished to pharmacists as widely as possible.

The secretary submitted information as to the cost of such a publication and suggestions as to its title and form.

It was understood that the president would discuss this question in his address in order that it might be brought directly to the attention of the Association and to the consideration of the House of Delegates.

The meeting then adjourned until 8 00 P M

* * * * *

The evening meeting was called to order at 8 20 P M with the same attendance as in the afternoon session

124 *The A P H A—N A R D Joint Committee* President Fischelis and Secretary Kelly reported verbally for the A P H A representatives of which Dr R L Swan is the third member

Reference was made to the report submitted to the meeting of the Executive Committee of the Council on January 4 1935

Since that meeting, only one meeting of the Joint Committee had been held, in Washington, D C, on March 12, 1935 at which three delegates from the Conference of Pharmaceutical Association Secretaries had been invited to confer with the Joint Committee Unfortunately, President McCullough and Secretary Harring of the Conference were unable to attend Secretary Wilson of Georgia, the third delegate, and Secretary Hayman of West Virginia represented the Conference

At this meeting, the question of a joint membership fee was given further consideration and also the possibility of a popular publication to be issued jointly by the AMERICAN PHARMACEUTICAL ASSOCIATION and National Association of Retail Druggists to the members of the state associations No action was taken on either question

The attention of the Council was called to the agreements reached by the Joint Committee with respect to Pharmacy Week, U S P and N F Publicity, and First Aid Week as previously reported

The report was accepted and the Committee continued on motion of Army—Adams

125 *Committee on Standard Program* Chairman Hilton submitted a verbal report on the changes made in the program for this meeting

126 *Report of Committee on National Formulary* It was moved by Geo D Beal, seconded by J H Beal and carried that the recommendations in the report be segregated and considered serially

After a general discussion and on motion of Geo D Beal—Army, the appointment of a special Committee on N F and R B Policies was authorized to consist of three members of the Council and, as ex-officio members, the chairmen, respectively, of the Committee on N F, of the Committee on R B and of the Committee of Revision of the U S P, to consider Recommendation No 1 and to report to the Council at the next annual meeting

On motion of Army—Adams, Recommendation No 2 was referred to the Committee on N F and R B Policies for consideration and recommendation

With respect to Recommendation No 3, the Council approved the issuance of supplements to the N F VI, as required, each supplement to be approved by the Council before issuance, on motion DuMez—Geo D Beal

With respect to Recommendations Nos 4 and 5, it was decided to continue the salary of the secretary until January 1 1936 and that the Committee on Finance be requested to prepare a budget for N F revision including the services of a secretary to the chairman and of research workers, on motion Geo D Beal—Fischelis

On motion Fischelis—Army, Recommendation No 6 was referred to the Committee on N F, and R B Policies and on motion of Adams—Geo D Beal, Recommendation No 7 was referred to the Committee on Finance for consideration and recommendation

127 *Commission on Proprietary Medicines* The following report was read by Chairman Beal

When the Commission on Proprietary Medicines was created, the specific task assigned to it was the preparation of a statement of the general principles to which package medicines advertised directly to the public should be expected to conform

After a period of study such a statement of general principles was agreed upon and submitted to the Council in 1915, and upon approval by the Council, was published in the JOURNAL OF THE ASSOCIATION

With the rendering of this report the specific purpose for which the Commission was created was completed, but the Commission has been continued from year to year without any clearly defined purpose or duties

Some years ago the Commission submitted to the Council the question whether it should undertake the study of the package remedies of the market, with the view of determining the extent to which they severally did or did not comply with the above code of general principles

After some discussion, the Council did not see fit to authorize such a study for the following reasons

That such an investigation would involve an expensive set-up and a continuous expenditure which the Council at that time was not prepared to authorize

It was felt that although the ASSOCIATION recognized that there is a place in pharmacy for package medicines when honestly exploited, it could not consistently with its past traditions authorize the publication of an approved list of such medicines, since such an approval would undoubtedly be used for advertising purposes

That the publication of a list of preparations of which it disapproved would very likely involve the ASSOCIATION in expensive and annoying litigation

Proposed New Federal Food and Drugs Act—For nearly two years past there has been pending in the United States Congress the Copeland Bill, re writing and extending the existing Federal Food and Drug Laws, and making important changes in the status of foods and drugs in interstate commerce

Numerous hearings on the Bill have been held before the senate Committee on Interstate Commerce, and the first crudely drawn measure has been extensively modified, most of the modifications having been made by the friends and authors of the bill As modified the Bill has received the approval of the Senate and is now being considered in the House of Representatives Present indications are that either with or without further modification in minor particulars, the measure will become a law within the near future

The existing Federal Act, known as the Food and Drugs Act of June 30, 1906, was principally a labeling law, applying mainly to the labels on foods and drugs, and by inference, to the literature accompanying the packages of such articles In general the Federal Act has been efficiently administered, and to such an extent that grossly or wilfully misbranded foods and drugs have been largely driven from the markets But while fairly efficient in controlling false statements accompanying packages of drugs, the law did not reach other forms of advertising, in consequence of which lack of control the advertising in newspapers and through radio announcements of certain package remedies have far exceeded the limits of decency and truthfulness The existing federal law is also lacking in that it does not apply to cosmetic preparations, which have become such a large factor in modern drug merchandising

The new law when it reaches the statute books, will not only apply to cosmetic preparations as well as to foods and drugs, but will also bring within its scope public advertisements of every kind, including radio announcements, which are made for the purpose of advancing the sale of such articles

While perhaps no law is ever completely effective in restraining the evils at which it is aimed the provisions of the pending Copeland Bill justify the belief that it will eliminate at least the major abuses which have hitherto so frequently prevailed in the advertising of certain classes of package remedies

Scientific Section of Proprietary Association—Recent drug trade publications have contained announcements of a reorganization of the Scientific Section of the Proprietary Association, and the Minutes of the 53rd Annual Meeting of that Association presents a verbatim report of the proceedings of the reorganized Section

From these Proceedings it appears that among the activities proposed for the Section is the careful study of the medicinal agents found in package medicines and the elimination of those which may give rise to injurious results especially when used otherwise than under direct control of an attending physician Among the agents condemned in the report and which it is stated should never be used as ingredients in package remedies are dinitro phenol and cincophen, a decision with which many of the members of the A. P. H. A. will agree

Another proposed objective is the investigation of attacks upon package remedies, and when such attacks are found to be justified by the facts, to provide for the correction of such faults, or when such attacks are found to be unjust, to prepare and publish the material for their repudiation

If these projects are consistently carried out, the results cannot fail to advance the welfare of the legitimate package medicine industry

The report was received on motion of Adams—Army

Dr. Beal personally recommended that the Commission, on which he did not expect to

continue to serve, be reorganized, that the members be elected at one time to serve for a fixed period, and that the Commission be given definite instructions as to its work After discussion, it was decided to consider the recommendation at a later meeting of the Council

128 Reduction in the Nominees for the Presidency Consideration was given to the recommendation of Former-President Swain in his address at the 1934 meeting that the number of nominees be reduced from three to two The recommendation was continued for further study on motion of Beal—Army

129 Honorarium to the Editor of R B I The secretary reported that Motion No 29 as submitted in Council Letter No 15, page 51 and as referred to in Council Letter No 16, page 57, had failed as lacking a majority

130 A Ph A Monographs Chairman DuMez of the Committee on Publications reported on the possibilities of publishing the Monograph on Aconite recently completed The Committee was requested to further investigate the publication and distribution of the monograph and to report to the Council, on motion of Army—Geo D Beal

131 Certificates of Appreciation to the Members of the Committee on Pharmacy Exhibit at the Century of Progress and to Miss Esther Barney and Mr Thaddeus Niemec The secretary reported on the arrangements for the preparation and presentation of these certificates and the action of the secretary was approved on motion Army—Geo D Beal

132 Nomination of Honorary President, Secretary and Treasurer of the Association Dr D M R Culbreth was nominated to the House of Delegates for election as Honorary President for 1935-1936 on motion of Army—Kelly, E F Kelly, as Secretary on motion Fischelis—Eberle, and C W Holton as Treasurer on motion of Army—Geo D Beal

133 Election of Honorary Member Upon the recommendation of Dr Edward Kremers Dr C A Rojahn of Germany, was elected an Honorary Member of the ASSOCIATION on motion of DuMez—Army

134 Election to Membership On motion of Kelly—Army, the following applicants were elected members

No 265, Frank Nicholas Bono, 725 Columbia, Houston, Texas, No 266, Will T Bradley, 179 Longwood Ave, Boston, Mass, No 267, Louis Milner, 4400 Chestnut St, Philadelphia, Penna, No 268, Columbus Claud Harris, 1019 McGowen Ave, Houston, Texas, No 269 Elmer Baxter Williams, 1101 Main St, Boise, Idaho, No 270, Edward H Divine, 301 No Central Park Ave, Chicago Ill, No 271, Peter Henry Brady, 825 Sprague Ave, Spokane Wash, No 272, Timothy Sylvester Shea, 390 Main St, Worcester, Mass, No 273 R C Shultz, Worland, Wyoming

135 Annual Report of the Council to the House of Delegates The president, the chairman of the Council and the secretary were authorized to prepare the report for presentation to the House of Delegates on motion of Army—Eberle

The meeting then adjourned

* * * * *

The Third Meeting of the Council was held in the Hotel Multnomah on Thursday, August 8, 1935 with the following members present Hilton, Fischelis, Army, Christensen, Adams, J H Beal, Geo D Beal, Eberle, DuMez and Kelly President-Elect Costello also attended

The minutes of the Second Meeting were read and approved on motion Adams—Army, with the correction of the suggested name "Popular Journal" to "Proposed Publication"

136 Committee on Research Chairman Army read the following report

Your committee transacted its business during the year by means of four bulletins On Monday morning August 5th the sub-committee on research projects, held a meeting with four of its five members present On Wednesday afternoon, August 7th, a meeting of the entire committee was called at which time the recommendations of the sub committee were adopted by unanimous vote

The three-year project on drug extraction conducted 1932-1935 by Dr Husa and his associates of the University of Florida speaks for itself At this (Portland) meeting Dr Husa is presenting to the Scientific Section, four papers on the subject Nine papers in all have been submitted since 1932 on this important problem

The great success of the Husa project convinced your committee that a similar comprehen-

sive piece of research should be planned for the coming few years. Our discussion of this topic led to the following committee recommendations:

(1) That the research begun in October 1935 should be on the subject of tests and assays of (a) N F ampul solutions, (b) N F tablets

(2) That the grant be for a period of one year, with the likelihood of renewal for a second or even a third year

(3) That the present sub committee of five (on research projects) be continued and that it be estimated with details of supervision of the proposed project

(4) That an auxiliary committee of three scientists in manufacturing concerns be formed to furnish technical advice as required

(5) Your committee feels that the proposed \$1000.00 grant is scarcely adequate to cover the type of work desired. We therefore request the Council to authorize a grant of \$1500.00 from the A. P. A. Research Fund

(6) Your committee has not as yet decided upon the person (and laboratory) where the proposed work will be performed. We request the Council to permit the Research Committee (or its sub committee on research projects) to continue the negotiations as to the recipient of the grant, our committee to make the nomination, subject to confirmation by the Council

The report was received and the recommendations approved on motion of Beal—Army subject to the approval of the Committee on Finance with respect to the appropriation and with the understanding that the research project will be conducted under the immediate supervision of Chairman Gathercoal

137 American Council on Pharmaceutical Education The secretary read the following report from the representatives of the A. P. A. of which H. A. B. Dunning and D. F. Jones are the other members:

The American Council on Pharmaceutical Education takes pleasure in reporting to you that progress has been made, even though it cannot present, at this time, tangible evidence of this accomplishment. The success of any undertaking of the kind entrusted to the Council depends to a very considerable extent on the degree to which troublesome obstacles have been removed, and the care which has been taken in laying the foundation for the beginning of organized work. Our case is no exception to the rule.

At the meeting held in Washington, D. C., on May 7, 1934, the Council decided that it would proceed immediately with the studies which it will be necessary to make. The Council was moved to make the above decision primarily for the reason that it was evident that many of the members of the associations represented were becoming impatient with what they believed to be unnecessary delay in starting the work of making standards. However, after your chairman and secretary had consulted with our advisor from the American Council on Education and a sizeable number of individuals of the three organizations represented on the Council, it was decided to wait just a little longer in order to give time for the removal of certain obstacles which it was believed would, if allowed to stand, work out to our disadvantage in the end. As a result of developments over the past few months, these obstacles no longer stand in our way and the Council, at the meeting held here on August 3, 1935, decided that the work of formulating standards be proceeded with, without further delay.

It may, therefore, be expected that the first assignment of work will be sent out shortly after the schools and colleges open in September. It is the intention to push the work along as rapidly as possible from now on, and it can be expected that the next report will be one of tangible progress.

During the past year, two of the associations represented on the Council have made their contributions of \$200.00 each, to the working fund, making a total of \$400.00 received. None of this has been spent to date, but is being held on deposit in Baltimore.

President Fischelis suggested that in sending out tentative standards, the Council on Pharmaceutical Education should express its opinion on them.

The report was received on motion of Army—Beal

138 Committee on N F and R B Policies The chairman announced the appointment of Geo. D. Beal, H. V. Army and E. F. Kelly as members of the Committee on which Chairman Gathercoal, Chairman Lascoff and Chairman Cook will serve as advisory members.

The appointments were approved on motion of Army—Beal

Chairman Geo D Beal stated that the members had met with Chairman Gathercoal and Cook, and submitted the following report

August 8, 1935

To the Council of the American Pharmaceutical Association

Gentlemen 1 Your Committee on N F and R B Policy wishes to give further consideration to the proposal of increasing or decreasing the number of members of the Committee on N F Revision and establishing a rotation of election, and to that end will correspond during the year and perhaps report by Council letter

2 We recommend that the statement of general principles of N F Revision be formally approved at this time

3 We recommend that the following statement be adopted by the Council and appended to the General Notices in N F VI

"In conformity with the policy on scope of the National Formulary, and in recognition of the priority of the United States Pharmacopœia as a standard within the United States notice is hereby given that should the Committee of Revision of the United States Pharmacopœia, Eleventh Decennial Revision, approve for admission and establish standards, by supplements, for items already included in the N F VI, the Pharmacopœial standards shall supercede those of the National Formulary when official notice by publication has been made of that action "

On motion of Geo D Beal—DuMez the report was received and approved

139 *Addition to the 1935 Budget* The recommendation of the Committee on Horticultural Nomenclature that an appropriation of \$20 00 be made for the expenses of the Committee was approved and the appropriation was added to the budget for 1935, on motion of Beal—Army

140 *Committee on National Pharmacy Week* The recommendation of the Committee that its appropriation be increased as submitted in its report to the House of Delegates and referred to the Council, was, after discussion, referred to the Committee on Finance for study and recommendation on motion of Adams—Geo D Beal

141 *Pharmacists' Society of the District of Columbia* A letter from President Norelli of the Society was read requesting some form of affiliation with the ASSOCIATION After an extended discussion of the question and on motion of Beal—Geo D Beal, the secretary was authorized to reply to the communication

On motion of Adams—Army, it was directed that the letter be brought to the attention of the Committee on Resolutions

142 *The Proposed Publication* The issuance of the publication was discussed at length, attention being given to the expense involved, the policy with respect to advertising its relation to the membership of the ASSOCIATION the editorial policy and its contents

On motion Geo D Beal—Christensen the question of the proposed publication was referred to the Committee on Publications for the purpose of submitting a report on policy and budget as promptly as possible, and that consideration of the final report be had at a meeting of the Council to be held in December

143 *Suitable Emblem for the Association* Dr Geo D Beal submitted the following communication

During the making of plans for the interior decoration of the new building of the Mellon Institute of Industrial Research in Pittsburgh, Pa, thought was given to the incorporation in the floor of the entrance foyer of a series of brass patera symbolic of the professions that have advanced through research, and that have been instrumental, through their work of advancing the course of industrial research in the United States Anyone conversant with the subject naturally includes the AMERICAN PHARMACEUTICAL ASSOCIATION among the learned societies that typify such research

While the A PH A has a form of badge or button, and likewise an official seal, neither of these is symbolic of the profession and science of Pharmacy Our policy on such patera is not yet definitely established, and we still have in mind the reproduction of our button However, this only emphasizes the need for an ASSOCIATION emblem that is truly symbolic

There is included herewith a rubbing of a symbol used by Eli Lilly & Co on the cover of the souvenir book describing the recent dedication of their new research laboratory Such an emblem is an illustration of the type that might be used by the A PH A

' It is moved by Geo D Beal that a committee of the Council (new) be appointed to consider the question of a suitable emblem for the AMERICAN PHARMACEUTICAL ASSOCIATION, and to report to the Council upon the propriety of an emblem, together with suggestions regarding suitable designs to be adopted by the Council and the ASSOCIATION "

As a member of this committee I would like to propose the name of Dr W A Hamor, Assistant Director of Mellon Institute, a member of the A P H A and an authority on such matters I am sure that Dr Hamor would gladly give of his time to such an undertaking

After discussion and on motion of Geo D Beal—Christensen, the chairman was authorized to appoint a special committee to consider the matter and to report to the Council

The meeting then adjourned subject to the call of the chairman

* * * * *

The Fourth Meeting of the Council was held on the Multnomah Hotel on Friday evening, August 9 1935, after the Final General Session, with the following members present Hilton, Fischels Arny, Adams, Christensen, Swain, DuMez, Eberle and Kelly

The minutes of the Thurd Session were read After a discussion, the chairman ruled that the words "if the final report can be completed in the meantime" under Item 142 be omitted The amended minutes were approved on motion DuMez—Fischels

144 *Section on Practical Pharmacy and Dispensing* The request of the Section for an appropriation of \$75 00 for the continued collection of information pertaining to professional pharmacy was referred to the Committee on Finance, on motion of Adams—Swain

145 *Committees on Library and on Museum* The secretary reported that nominations had been received from only two members of the Council (see Council Letter No 13, pages 329 and 330 and Council Letter No 16, page 511) After discussion, it was decided on motion of Arny—Adams, that these nominations be made a matter of business in the first Council Letter of 1935—1936

There being no further business, the meeting was adjourned sine die

E F KELLY, *Secretary*

THE COUNCIL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 1935-1936

Office of the Secretary 2215 Constitution Ave , Washington, D C

LETTER NO 1

August 9, 1935

To the Members of the Council

The reorganization and First Meeting of the Council 1935-1936 was held in the Multnomah Hotel Portland, Oregon, on Friday, August 9, 1935, beginning at 10 15 P M

1 The roll was called and the following were present Hilton, Arny, Christensen, Adams, Fischels, Swain, Costello Delgado, Hayman Cook and Kelly

2 *Election of Chairman* S L Hilton was elected Chairman of the Council for 1935-1936 on motion of Arny, seconded by Adams and carried

3 *Election of Vice Chairman* H C Christensen was elected Vice Chairman of the Council for 1935-1936, on motion of Swain seconded by Arny, and carried

4 *Election of Editor of the Journal* E G Eberle was elected Editor of the JOURNAL for 1935-1936, on motion of Adams, seconded by Hayman and carried

5 *Election of Editor of the Year Book* A G DuMez was elected Editor of the YEAR BOOK for 1935-1936 on motion of Swain seconded by Hayman and carried

6 *Membership of the Council* The membership and officers of the Council for 1935-1936 are as follows

ELECTED MEMBERS

H V Arny, 115 W 68th St , New York, N Y (Term expires 1936)

H C Christensen, 130 N Wells St , Chicago, Ill (Term Expires 1936)

W D Adams, Forney, Texas (Term expires 1936)

H A B Dunning Charles & Chase Sts Baltimore, Md (Term expires 1937)

S L Hilton, 1033 22nd St N W Washington D C (Term expires 1937)

W Bruce Philip, Munsey Bldg, Washington D C (Term expires 1937)
 J H Beal Fort Walton, Fla (Term expires 1938)
 R L Swain, 2411 N Charles St, Baltimore, Md (Term expires 1938)
 C H LaWall, 214 S 12th St, Philadelphia, Pa (Term expires 1938)

EX OFFICIO MEMBERS

P H Costello Cooperstown N Dak
 Frank A Delgado, Department of Commerce, Washington D C
 J Lester Hayman 325 Ash St Morgantown, W Va
 R P Fischelis, 28 West State St Trenton, N J
 E F Kelly, 2215 Constitution Ave, Washington D C
 C W Holton, Box 81, Essex Fells N J
 Roy B Cook, 1559 Lee St, Charleston, W Va
 E G Eberle, 2215 Constitution Ave, Washington, D C
 A G DuMez Lombard & Greene Sts, Baltimore, Md

OFFICERS OF THE COUNCIL

S L Hilton, *Chairman*
 H C Christensen, *Vice-Chairman*
 E F Kelly, *Secretary*

7 *Finance Committee* Chairman Hilton appointed W Bruce Philip, *Chairman* C H LaWall and C W Holton as members of the Committee on Finance and these appointments were confirmed on motion of Army, seconded by Delgado and carried

8 *Committee on Property and Funds* The personnel of this Committee as provided for in the Council By-Laws is as follows P H Costello C W Holton, S L Hilton, W Bruce Philip and E F Kelly

9 *Committee on Publications* Chairman Hilton appointed H V Arny C H LaWall and Walter D Adams as members of the Committee, the other members being E G Eberle, E F Kelly, A G DuMez and C W Holton, as provided in the By-Laws These appointments were confirmed on motion of Army, seconded by Delgado Chairman Hilton appointed A G DuMez as *Chairman* of the Committee on Publications

10 *Committee on Standard Program* The chairman appointed S L Hilton, T J Bradley and E F Kelly as members of the Committee on Standard Program

11 *Advisory Committee of the Council* It was moved by Swain that the chairman be authorized to appoint an Advisory Committee consisting of seven members to be held subject to the call of the chairman or secretary, to confer on matters not considered of sufficient importance to warrant a meeting of the Council and to appoint the members subject to confirmation by the Council The motion was seconded by Christensen and carried

12 *Committee on Pharmaceutical Research* On motion of Army, seconded by Swain and carried W L Scoville and John C Krantz Jr were elected members of this Committee to serve until 1940

13 *Commission of Proprietary Medicines* On motion of Fischelis—Army, the Commission was discontinued

14 *Committee on Proprietary Medicines* On motion Fischelis—Army, it was decided to elect a committee of seven members to take the place of the Commission on Proprietary Medicines, and to serve for one year J H Beal R P Fischelis, R L Swain F A Delgado W B Day, Roy B Cook and A L I Winne were nominated and on motion Army—Hayman, the nominations were closed and the secretary was authorized to cast the ballot of the Council for their election The secretary cast the ballot and the chairman declared the nominees elected

15 *Committee on Recipe Book* After a general discussion, it was moved by Army that the Committee on Recipe Book as listed by chairman Lascoff, be continued for one year The motion was seconded by Adams and carried

16 *Appointment of Standing and Special Committees and Delegates of the Association*

Committees

Committee on the Study of Pharmacy—Same as at present *Committee on Cosmetics*—Same as at present *Committee on Local Branches*—Same as at present *Board of Canvassers*—Gustav Bachman, Charles V Netz and Charles H Rodgers, all of Minneapolis, Minn *Committee on Legislation*—*Chairman*, E F Kelly, Washington, D C , R P Fischelis, Trenton, N J , S L Hilton, Washington, D C , R L Swain, Baltimore, Md , and W Bruce Philip, Washington, D C *Committee on U S Pharmacopœia*—Same as at present except that Arthur F Schlicting, St Louis, Mo (1945) replaces Theodore F Hagcnov *Committee on Pharmaceutical Syllabus*—E R Serles reappointed for term ending 1942 *Committee on Pharmacy Week*—Same as at present *Committee on Horticultural Nomenclature*—Same as at present *Committee on Physiological Testing*—Same as at present *Committee on Weights and Measures*—*Chairman*, M N Ford, Columbus, Ohio, R P Fischelis, Trenton, N J , W Mac Childs, Eldorado, Kans , A C Taylor, Washington, D C , Roy D Baker, Denver, Colo , the *Chairman* of the Section on Practical Pharmacy and Dispensing, and the *Chairman* of the Committee on Prescription Tolerances *Committee on Wilham Procter Jr Memorial Fund*—Same as at present *Committee on International Pharmaceutical Nomenclature*—Same as at present *Committee on Press Relations*—Same as at present except that R W Rodman becomes *Chairman* *Committee on Prerequisite Legislation*—Same as at present *Committee on Endowment Fund*—Same as at present *Committee on Maintenance*—Same as at present *Committee on Pharmacy Corps*—Same except E E Duncan Oklahoma City, Okla, replaces F L McCartncy *International Pharmaceutical Federation*—Same as at present *Committee on Prescription Tolerances*—Same except M J Andrews, Baltimore Md , replaces Walter F Meads *Committee on Council on Pharmaceutical Practice*—Same except that P H Costello, Cooperstown, N Dak , replaces R P Fischelis *Committee to Draft Model Act Restricting Distribution of Drugs and Medicines to Pharmacists*—Same except that H C Christensen, Chicago, Ill , replaces F E Mortensen *Committee on Professional Relations*—Same as at present

On motion Adams—Delgado, the appointments, as submitted, were approved

The meeting then adjourned

E F KELLY, *Secretary*

ASSOCIATIONS

Information has come that there probably will be no meeting of the Nevada Association this year

At the meeting in Portland, Oregon, rebates and allowances, not open to all retailers, were condemned by resolution of the Oregon Pharmaceutical Association Another resolution enlisted the cooperation of druggists in the state in fighting cut-rate stores It has been suggested that the idea of holding a tri state meeting will be repeated next year

Don F Allen, of Corvallis Ore , was elected president of the Oregon Association and Charles J Ajax of Seattle, was reelected president of the Washington State Pharmaceutical Association Idaho druggists did not hold a reelection

James L O'Neill, who has headed the new NRA for the past two months has resigned

from administration duties to return to his old position as acting vice president of the Guaranty Trust Company in New York City

Howard C Newton, who joined the staff of Creighton University School of Pharmacy in 1914, and who has served as dean of the School during those years, is leaving the School and the middle west to join the faculty of the Massachusetts College of Pharmacy at Boston

J Leon Lascoff completed his 25th year on the New York Board of Pharmacy and has been re appointed a member

Roy A Perry, president of the Oregon Pharmaceutical Association, advocates the movement of "Back to Pharmacy," and advancing the standards of Professional Pharmacy

H W Youngken was elected Grand Regent of the Kappa Psi in Portland, succeeding Grand Regent Mickelsen whose term expires in 1936 Dr Youngken will be installed at the convention in Dallas

COMMITTEE REPORTS

REPORT OF THE COMMITTEE ON RESOLUTIONS *

Recommendations 1 to 17, inclusive, were submitted by President Fischelis at the conclusion of his Presidential Address

The months intervening since the 1934 convention of the AMERICAN PHARMACEUTICAL ASSOCIATION have been very important not only in the life of the nation itself, but in the affairs of this ASSOCIATION Pharmacy has been confronted with problems of great complexity and importance, many of which at times seemed to threaten the existence of our calling as a profession In the face of such circumstances, intelligent aggressive leadership was required, and it should be a matter of gratification to the members of this ASSOCIATION that President Fischelis approached and discharged his duties in a frank and courageous manner

Recommendation No 1

It is recommended that it shall be the policy of the AMERICAN PHARMACEUTICAL ASSOCIATION to require its full-time officers to confine their pharmaceutical activities to the affairs of the ASSOCIATION This is not to be interpreted as an abridgment of the privilege to take part in related affairs in the capacity of advisor, committeeman or delegate It is, however, to be interpreted as abridging the privilege of serving in a secretarial or managerial capacity to any other organization or group or to act as the spokesman or representative of any other organization or group within the sphere of pharmaceutical activity unless permission to do so is specifically granted by the Council

The Committee is sympathetic with the principle of this recommendation in the President's Address but feels that the purpose can be fully effectuated by referring it to the Council for further study and for whatever action it deems to be in the best interest of the ASSOCIATION

By vote of the House of Delegates the President's recommendation was substituted for the recommendation of the Committee on Resolutions

Recommendation No 3

It is recommended that it shall be the policy of the AMERICAN PHARMACEUTICAL ASSOCIATION to work actively toward a unification of pharmacal forces within the United States and that the immediate steps to be taken in this direction shall be the fostering of an intimate contact with the State Pharmaceutical Associations and with the National Association of Retail Druggists to the end that membership in State Pharmaceutical Associations shall eventually carry with it a personal affiliation of every State Association member with the A P H A and the N A R D—Approved

Recommendation No 4

It is recommended that it shall be the policy of the AMERICAN PHARMACEUTICAL ASSOCIATION to assume active responsibility for the general direction of pharmaceutical affairs in the United States This is not to be interpreted as an effort to duplicate the activities of any organization now functioning in a specific field such as education, licensure, manufacturing wholesaling or retailing It is, however, to be interpreted as an offer of cooperation from the representatives of the profession at large with respect to the formulation of policies affecting pharmacy as a whole and as an expression of the intent to assume leadership in those matters which are national in their scope and which affect the relations of pharmacists to other professions the relations of pharmacists to each other and the relations of pharmacists to the public —Approved

Recommendation No 6

It is recommended that that office of Librarian and Curator of the Museum be created as soon as possible as a full-time office —Approved

Recommendation No 7

It is recommended that the contents of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION be confined to scientific and professional papers of permanent value or significance

* Portland meeting of AMERICAN PHARMACEUTICAL ASSOCIATION

to the monthly abstracts of pharmacutical literature and to editorials dealing with scientific and professional matters. It is further recommended that as soon as this change can be brought about, the material of general interest now appearing in the JOURNAL together with helpful papers and articles on professional and economic subjects be issued in the form of a new monthly publication directed particularly to the retail pharmacists of the United States. It is further recommended that this publication carry no advertising.—Approved

Recommendation No 8

It is recommended that the new JOURNAL referred to in the preceding recommendation be mailed to the members of all State Pharmaceutical Associations upon payment of a small per capita tax by the respective state Associations and that it be issued with the cooperation of the N A R D if the plans for unification and coordination of the activities of State Associations and the two national associations now under discussion are consummated.—Approved

Recommendation No 9

It is recommended that the cooperation of the A P H A be extended to Boards of Pharmacy in their efforts to establish adequate standards for the practical training of pharmacists, especially in cases where departures from established customs are contemplated and that the results of any survey or study which the ASSOCIATION may make in connection with the formulation of standards for practical experience be made available to the Boards.

The Committee on Resolutions is fully in accord with the principles and objective of this resolution, but the Committee feels that it deals more particularly with the work of the National Association of Boards of Pharmacy and the American Council on Pharmaceutical Education, therefore as chairman of the Committee, I am instructed to move that this recommendation be sent to the Council of the AMERICAN PHARMACEUTICAL ASSOCIATION and the secretary of the N A B P and the secretary of the American Council on Pharmaceutical Education, and to the Council on Pharmaceutical Practice (added on recommendation of President Fischelis), for their consideration.—Approved

Recommendation No 10

It is recommended that the dangers of the distribution of drugs and medicines without the supervision of pharmacists be called to the attention of the American Medical Association and Medical Societies of various states with the request that they join the A P H A in an aggressive effort to persuade drug manufacturers to limit distribution of their drug products to registered pharmacists.—Approved

Recommendation No 11

It is recommended that the Council on Pharmaceutical Practice give consideration to certification of specialists in the field of hospital pharmacy, manufacturing pharmacy and prescription pharmacy, by the establishment of boards of experts for such certification.—Approved

Recommendation No 12

It is recommended that the committee on study of pharmacy be instructed to explore the possibilities of extension courses for practicing pharmacists to the end that formal lectures and demonstrations in connection with newer materia medica may be arranged at suitable points and that such instruction be confined to fundamental scientific progress in the field rather than to commercial preparations.—Approved

Recommendations Nos 2, 5 and 13

(2) It is recommended that the secretary of the ASSOCIATION be also designated as general manager and that this title shall carry with it executive supervision of and responsibility for the activities of the ASSOCIATION in the headquarters building.

(5) It is recommended that the president elect be made an ex officio member of the Council immediately following his election and that the procedure at the annual convention be so arranged as to give the president-elect an opportunity to submit recommendations in time for approval at the meeting at which he takes office.

(13) It is recommended that the By-Laws be amended to reduce membership of the Council

to six elected members and three ex-officio members, namely the President, the President-Elect, and the Chairman of the House of Delegates. The six elected members should be distributed geographically in accordance with the concentration of membership.

The Recommendations 2, 5 and 13 in the President's Address are not approved but the Committee on Resolutions wishes to present the following resolution dealing with them.

Resolved, that while it is quite clear that Recommendations 2, 5 and 13 in the President's Address have been carefully considered by the President, and also by the members of the Committee on Resolutions, it is the opinion of the Committee that the recommendations herein referred to raise important questions which suggest the advisability of a general study of the By-Laws of the ASSOCIATION. To make them effective will, in the opinion of the Committee, require amendments to the By-Laws and perhaps the charter of the ASSOCIATION. For these reasons it is recommended that the incoming president appoint a committee of five (5) to study the constitution and By Laws of the ASSOCIATION and to report to the next annual meeting on changes which it deems necessary to make in the constitution and By-Laws and charter of the ASSOCIATION to place the ASSOCIATION in a position to function most effectively in the light of the new duties which it will be called upon to undertake and in the light also of the widened responsibilities of the ASSOCIATION.

Be it further resolved, that the committee appointed pursuant to the above resolution endeavor to complete its task in time to have its findings and recommendations submitted by publication to the membership sufficiently far in advance of the 1936 meeting to enable the membership to be apprised of the changes proposed.—Approved

Recommendation No 14

It is recommended that the Council be authorized to take such steps as may be necessary to obtain the best legal opinion on the status of the National Formulary as a legal standard under the Food and Drugs Act and that such changes as may be required in the manner of selecting the Revision Committee in order to obtain Congressional authorization for the revision and publication of the National Formulary, be inaugurated as soon as possible. It is further recommended that the U S P Revision Convention be urged to take similar steps with respect to the U S P.

The Committee did not take any action on this recommendation in the President's Address as it deals with matters more properly within the province of the Council and we therefore recommend that it be referred to the Council for further consideration.—Approved

Recommendation No 15

It is recommended that the Committee on Proprietary Medicines be requested to study the possibilities of organizing an informational service to the profession with regard to the Composition Standards, Classification and ethical status of proprietary medicines and report its recommendations to the Council for action at an early date.—Approved

Recommendation No 16

It is recommended that the Committee on Cosmetics be requested to give immediate attention to the possibility of organizing a Council on Cosmetic Preparations with functions similar to the Council on Pharmacy and Chemistry of the A M A and the Council on Dental Therapeutics of the A D A so that necessary information on the composition and claims made for cosmetics may become available to pharmacists and proper standards be devised for the protection of the public in the commerce in these Commodities.—Approved

Recommendation No 17

It is recommended that the Council give immediate attention to the possibility of making available from the permanent funds accumulated interest or other sources a sufficient sum of money to launch some of the activities to which the ASSOCIATION is committed. In launching these activities preference should be given to the ones which appear to promise the most immediate return of the financial outlay required in their inauguration. Activities which seem to require immediate attention are revision of the publication program, membership campaigns, Council on Pharmaceutical Practice.—Approved

Resolution of the New York Branch

WHEREAS the AMERICAN PHARMACEUTICAL ASSOCIATION by virtue of its constituency should be the major representative body of American Pharmacy, and

WHEREAS such a position is dependent in part upon the AMERICAN PHARMACEUTICAL ASSOCIATION having a greater membership among those engaged in the various phases of pharmacy in the United States, and

WHEREAS the Local Branches of the AMERICAN PHARMACEUTICAL ASSOCIATION are the logical points of contact between the individual member and the parent organization, and

WHEREAS more extensive activity fostered by financial support of the Local Branches may be a possible factor in increasing membership in the AMERICAN PHARMACEUTICAL ASSOCIATION—

Be it resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION give consideration to the desirability of having all members of this ASSOCIATION residing in districts wherein duly organized Local Branches are, or may be, established, automatically become members of the local body by virtue of their membership in the AMERICAN PHARMACEUTICAL ASSOCIATION, and

Be it further resolved, that the annual dues of each member of the AMERICAN PHARMACEUTICAL ASSOCIATION include membership in the Local Branch of his district or election, if such a body is at present organized or may later be formed within a radius of fifty (50) miles of his mailing address, and that the AMERICAN PHARMACEUTICAL ASSOCIATION allocate 50¢ (or \$1 00) yearly to said Local Branch for each duly elected member thereof, such sum to be in lieu of the dues now collected by the Local Branches, and

Be it further resolved, that members residing in a district bordering upon an adjacent district may signify their choice of the Local Branch they wish to identify themselves with but in no instance shall such choice be permitted unless they reside within a radius of 50 miles of the Local Branch of their election

This resolution is approved by the Committee but inasmuch as it deals with the finances of the ASSOCIATION under the By-Laws it is referring it to the Council of the ASSOCIATION

Report of the Committee on Local Branches

Resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION do all that is practical to increase interest in the establishment of Student Branches of the ASSOCIATION in the several colleges of pharmacy of the United States and that it give due consideration to the question of student dues so that the burden upon the student may be reduced to the lowest possible amount

This resolution is formulated upon the report of the Committee on Student Branches and as it does in some respects deal with the finances of the ASSOCIATION under the By-Laws it automatically goes to the Council

Report of the Committee on Weights and Measures

The Committee on Resolutions commends the report of the Committee on Weights and Measures and believes that the suggestions made in the report are constructive and recommends that the report be printed in the JOURNAL so that it may come to the attention of all those interested in improving conditions dealt with in the report and those charged with the duty of enforcing such laws as are involved

Recommendation from the Section on Education and Legislation

Be it resolved that a committee be appointed by the President of the ASSOCIATION to be known as the National Committee on Professional Information Pertaining to Dental Pharmacy Its specific function shall be

First—To study the methods used by the various local, county and state organizations in their efforts to bring before dental men usable information on U S P and N F drugs and preparations

Second—To present to the pharmacists of the nation at our next annual convention a digest of constructive ideas gathered from such a survey and other sources

Third—The Committee is to act as a center for receiving and disseminating information which will increase the pharmacist's opportunities for professional scientific service to the dentist —
Approved

Recommendations from the Section on Historical Pharmacy

Resolved, that a committee of three (3) be authorized to be made in the regular way whose duty it shall be to study courses in History of Pharmacy giving especial attention to the scope, time and content of such courses and to bring a report of its findings to our next annual meeting and

Be it further resolved, that a copy of this resolution be sent to the American Association of Colleges of Pharmacy, American Council on Pharmaceutical Education and the Syllabus Committee —Approved

Resolved that the AMERICAN PHARMACEUTICAL ASSOCIATION by proper means, classify edit and publish the papers which have been presented before the Section on Historical Pharmacy, in an effort to create interest in the subject of the History of Pharmacy and to make more readily available the information contained in the papers which have been presented from time to time

While the Committee on Resolutions is in general accord with the spirit of this resolution, it does not feel that this is the proper time to recommend expenditure of funds on this subject

Establishment of a Fellowship within or under the Auspices of the American Pharmaceutical Association

WHEREAS, the AMERICAN PHARMACEUTICAL ASSOCIATION is an organization of pharmacists, including nearly all leaders in American pharmacy and those who are interested in the scientific accomplishments of our profession

WHEREAS, these professional and scientific workers deserve, in recognition and appreciation of the important services which they actually render and have rendered in the past to humanity and to pharmacy in America to be honored in a certain way as to show the expression of gratitude of the AMERICAN PHARMACEUTICAL ASSOCIATION for the work accomplished either in a professional, scientific or legal aspect,

WHEREAS THIS ASSOCIATION is much concerned with the question herein aroused, *therefore be it*

Resolved that the AMERICAN PHARMACEUTICAL ASSOCIATION establish the grading of Fellow to be granted to all pharmacists who are college graduates and who have distinguished themselves and devoted their lives to improve the conditions of the profession in any of the aspects hereinbefore mentioned,

And that a Committee to work on behalf of the ASSOCIATION be appointed in this Eighty-Third Annual Meeting to establish the rules and regulations by which this Fellowship is to be granted

The Committee is mindful of the good intent behind this resolution but feels that this is not the proper time to discuss a matter of such far-reaching importance We therefore recommend that it be referred to the Council to be considered in connection with whatever plans may come before the Council dealing with the membership of the ASSOCIATION —Approved

American Association for the Advancement of Science

In response to an invitation from the permanent secretary of the American Association for the Advancement of Science, the Committee offers the following resolution

Resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION appoint two delegates to the Seventh American Scientific Congress to be held in Mexico City from the 8th to the 17th of September of this year and that these delegates be instructed to participate as fully as possible in all the efforts to make the Congress a success —Approved

The following resolution is formulated upon two resolutions one coming from the Indiana Pharmaceutical Association and the other from the Section on Education and Legislation

Resolved that the AMERICAN PHARMACEUTICAL ASSOCIATION create a body or bodies with the necessary working facilities to give the pharmacists in this country up to date information on such pharmaceutical and medical material as new drugs, preparations, formulas standards plans for detaching doctors and dentists, as well as other medical groups and other information which will prove helpful and be instrumental in increasing the cooperation and service of the pharmacist to the allied medical professions This information is to appear periodically throughout each year and some method be devised so that all pharmacists may be privileged to take advantage of such

pharmaceutical service—This resolution is approved and referred to the Council as obviously to make it effective will require some financial outlay

Resolved, that the Committee known as The American Institute of Pharmacy Maintenance Committee be continued and that Dr H A B Dunning of Baltimore be asked to accept the chairmanship of the committee for the ensuing year—Approved

Resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION restate its belief that the present food and drugs act is too limited in its scope to afford the public the proper protection in the matter of food and drugs and cosmetics and that the ASSOCIATION endorse the bill now before Congress known as S 5 substantially in the form in which it passed the Senate and urge its prompt enactment and its officers are instructed to cooperate as fully as possible with all other agencies having this end in view and that a copy of this resolution be immediately sent to the chairman of the committees having the bill in charge—Approved

Resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION restates its interest in all efforts to make the medical and dental professions more fully acquainted with the drugs and preparations recognized in the U S P and N F , and instructs its officers to cooperate to the fullest extent possible with national, state and local pharmaceutical organizations endeavoring to carry on this important branch of pharmaceutical activity—Approved

Resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION in order that there may be built up a sounder economic basis for the retail practice of pharmacy, urges the NRA to compile such statistical information in its possession bearing upon the commercial problems of pharmacy and to make them available as rapidly as possible,

Resolved further, that the NRA be urged to continue the study of commercial problems affecting pharmacy in the various parts of the United States so that accurate information dealing with modern business practices and trends may be available—Approved

Resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION restate its conviction that the purposes of pharmacy would be further advanced by placing pharmacists on boards of health of the various states, and urges that state pharmaceutical associations be asked to place this objective on their legislative programs—Approved

Resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION express its profound appreciation of the success met with in Arizona, Iowa, Michigan and New Mexico in enacting prerequisite laws and that its officers be instructed to cooperate with those states that do not have such legislation as fully as may be required to secure the enactment of such laws—Approved

Resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION urges increased interest on the part of the state pharmaceutical associations in all efforts to secure legislation which will more adequately restrict the distribution of drugs and medicines to registered pharmacists, it being the unshaken belief of the ASSOCIATION that there does exist a direct relation between public health and the avenues of distribution of these essential public health commodities, and that the officers of the ASSOCIATION aid in all efforts to bring this about—Approved

Resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION extend its congratulations to the pharmaceutical associations of the following states New York, New Jersey, Pennsylvania, Maryland, Illinois, Wisconsin, Iowa, Oregon and Washington, for having secured the enactment of fair trade legislation patterned after the California fair trade act,

Resolved further, that it is the sense of this ASSOCIATION that more certain progress will be made if uniformity is obtained in the matter of contracts and administrative procedures under these laws,

Resolved further, that the ASSOCIATION instructs its officers to cooperate as fully as possible with the N A R D and all state pharmaceutical associations in an effort to have similar legislation enacted in all of the states—Approved

Resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION express its belief that decided improvement was made in the economic phases of pharmacy under the NRA code and that it regrets that this recovery movement failed to meet constitutional requirements, and

Resolved, that in order that the benefits of NRA may be continued and still further advanced

the ASSOCIATION urges the enactment of federal legislation which will permit the people of the states having fair trade laws to enjoy the maximum benefits of these laws, and

Resolved further, that it instruct its officers to cooperate to the fullest extent possible with the N A R D and other pharmaceutical agencies in their efforts to secure the enactment of such a law by the Federal Congress —Approved

Resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION desires to express its gratification to the American Association for the Advancement of Science for the creation of Section N-3 Pharmacy and for the opportunity to present a separate program illustrating the contributions of pharmacy to the advancement of science —Approved

Resolved, First, that the Committee on Pharmacy Corps in U S Army be continued and that it be instructed to continue its efforts to effect improvement in the pharmaceutical service in the Army and to obtain therein for pharmacy the recognition and status to which it is entitled by virtue of its traditions and the useful service which it is prepared, by education and training, to render

Second, that the Committee be instructed to cooperate with the Surgeon General in obtaining the passage of legislation which will bring about the substance of recommendation number one

If the objective as stated in the first recommendation cannot be attained by this procedure, we recommend

Third, that the committee be instructed to obtain the desired improvement in pharmaceutical service and its concomitant recognition by direct bill to congress —Approved

Resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION state its firm conviction that increased attention should be given to professional pharmacy and to making the public more conscious of the public health service rendered by pharmacy, and to this end urges more general observance of National Pharmacy Week and instructs its officers to cooperate fully with state pharmaceutical associations and other pharmaceutical groups in the observance of this occasion —Approved

Resolved, that the Committee on the William Procter Junior Memorial Fund be requested to proceed with the erection of the Procter statue in the foyer of the American Institute of Pharmacy as soon as practicable and that in conjunction with the Council, arrangement be made for its unveiling when completed —Approved

Resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION express its deep appreciation to the Department of Commerce for the cooperation furnished by the Department through F A Delgado and Arthur A Kimball in the preparation of the manuscript for "The Professional Pharmacy" and in the revision of the manuscript for further publication —Approved

Resolved, that the voting delegates from the State Pharmaceutical Associations be designated as auxiliary members of the Committee on Professional Relations and that the members of this Auxiliary Committee be urged to actively cooperate with the members of the medical, dental, nursing and other professions in the consideration of the economic problems of medical care —Approved

WHEREAS, some proposed methods of providing medical care to the public through Federal, State and private agencies contemplate corporate practice involving elimination or serious interference with the personal and private relations between members of the medical, dental, pharmaceutical and nursing professions and their clientele *be it*

Resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION expresses the belief that it is essential to good medical care and to the welfare of the public that the personal relation between those engaged in the practice of medicine, dentistry, pharmacy and allied professions, and their clientele be preserved —Approved

Resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION express its profound thanks to the pharmaceutical associations of Oregon, Washington and Idaho for having held a joint convention in the city of Portland during the week of the AMERICAN PHARMACEUTICAL ASSOCIATION convention and for the splendid hospitality extended by the pharmacists of these three states to the members of the AMERICAN PHARMACEUTICAL ASSOCIATION —Approved

Resolved, that the AMERICAN PHARMACEUTICAL ASSOCIATION hereby extends sincere appreciation to Local Secretary A O Mickelsen, Chairman L G Haack F C Felter, Frank Nau

Frederick Grill, Fred Geue, Earl Gunther, Edgar Stipe and all others who have contributed to the comforts of our delegates, for the most efficient and hospitable handling of accommodations and social events for the 83rd annual meeting

Appreciation is also extended to Mrs Ralph A Watson, Mrs Mickelsen, Mrs Larson, Mrs Dickey and Mrs Murphy for the courteous and enjoyable entertainment extended to the ladies attending the meeting

Appreciation and thanks is extended to the Hotel Multnomah for the favors and courtesies extended the A P H A guests and for the efficient service in preparing convention halls for meetings

The ASSOCIATION further extends appreciation to the *Morning Oregonian*, *Journal* and *News-Telegram* for their full and impartial report of the transactions of the meeting —Approved

RELIEF PRESCRIPTIONS BY STATES

The following schedules are abstracted from the N A R D Journal

Washington follows "Pacific Drug Review Pricing Schedule," less 25%

California prescriptions are recorded in duplicate Prescription pricing schedule is set up from which druggists must give 25% discount Cost of one prescription is limited to \$1 00, two or more \$2 00

New York prescriptions must be verified by phone, and copy signed by patient sent with quadruplicate bill U S P and N F drug required with few exceptions but specialties are not replaceable by official equivalents Prices to be net cost plus 25¢

In Ohio U S P and N F preparations are specified Charges to be net cost plus a 25¢ compounding fee

South Carolina relief prescriptions are filled on requisition orders from a field agent, a copy of which is attached to the requisition and mailed to the relief administration at the county seat

Minnesota restricts to U S P and N F items Charge includes cost plus 20% Medicines and medical supplies are to be furnished by registered pharmacists actually engaged in drug business

In Mississippi no special procedure has been worked out

New Jersey prescriptions are written on special forms Druggists file copies with the county director Once a month a county committee, appointed by the New Jersey Pharmaceutical Association goes over the prescriptions If exorbitant prices are charged, they are corrected

In Kansas, each county has its own method of handling

Rhode Island druggists may fill prescriptions signed by social workers in their town, but in cities where hospitals are supported by the city the prescriptions must be filed by the hospital

In West Virginia prescriptions are to be written on special forms General price range about 15% under normal

In Idaho, U S P and N F items specified The doctors to supply four copies of order The recipient must sign and quantities are limited as well as maximum prices

Indiana has no uniform plan

Massachusetts has no uniform plan

Texas prescriptions are handled on orders from local relief headquarters, copy of prescriptions are attached to bills A fee of 25% is added for expense of bookkeeping

Georgia has no uniform practice

In Wyoming, individual counties handle the practice, usually they are divided equally among drug stores in the county

In Florida, relief medical work is handled by a relief clinic Druggists formerly filled the prescriptions, but now pharmacists are employed by the clinics

In Oregon County nurses take care of relief prescriptions Counties pay bills

Colorado has no general rules

Pennsylvania specifies U S P and N F preparations Prescriptions are to be written on special forms and authorization attached to duplicate bills Prescriptions costing more than 50¢ must have special authority

UNITED STATES PHARMACOPŒIA

ABSTRACT OF PROPOSED CHANGES WITH NEW STANDARDS AND DESCRIPTIONS

ELEVENTH REVISION

Copyright 1935 by the Board of Trustees of the United States Pharmacopœial Convention *
All Rights Reserved

PART II—PROXIMATE ASSAYS

The Pharmacopœial Convention of 1930 recommended that 'abstracts of changes proposed for the U S P XI and new standards and descriptions' be published before final adoption that those who are not members of the Revision Committee may have an opportunity for comment and criticism

In compliance with this recommendation, the following abstracts are submitted The nomenclature and the exact wording to not necessarily represent that to be finally adopted

Comments should be sent to the chairman of the Revision Committee

E FULLERTON COOK,
43rd and Woodland Avenue,
Philadelphia, Pa

The most important changes proposed for the proximate assays of the U S P XI are as follows

1 Instead of using type processes for assays as was done in the U S P X, the detailed assay process will accompany each drug

2 The general statement for proximate assays has been rewritten and will be found below

3 The process for the assay of mydriatic drugs has been changed This change was made necessary by the research work of Dr H G DeKay, who showed that, in the case of hyoscyamus at least volatile amines were present and therefore it was necessary to heat the residues to eliminate them It was proved conclusively that mydriatic alkaloids in the absence of moisture and alkalis can be subjected to the temperature of a water-bath for an hour or more without decomposition The proposed change will be indicated under the *Assay of Hyoscyamus*

4 It is proposed to assay *Nux Vomica* for strychnine content instead of for total alkaloids

5 An assay process is proposed for *Camphorated Tincture of Opium*, a preparation which heretofore has not been officially assayed

6 Minor changes in the assay processes of a number of drugs are indicated on the following pages

The General Directions on Proximate Assays, to appear in the back of the Pharmacopœia, are as follows

GENERAL DIRECTIONS FOR THE ASSAY OF DRUGS

Most alkaloids are practically insoluble in water, but are soluble in certain organic solvents which are immiscible with water, such as chloroform ether, amyl alcohol, benzene, petroleum benzine or mixtures of these The salts of the alkaloids however, are usually soluble in water, but in most cases insoluble in nearly all of the above-mentioned solvents The process of assay by immiscible solvents, which is generally known as the 'shaking out' process, is based on this property of alkaloids and their salts and is carried out by treating the drug or a concentrated liquid extract with a solvent immiscible with water, in the presence of an excess of alkali which liberates the alkaloid The free alkaloid is dissolved by the immiscible solvent which is then transferred to a separator and extracted with an excess of acid which has been diluted with distilled water The acid portions are then extracted with an immiscible solvent in the presence of a slight excess of alkali and the immiscible solvent evaporated to obtain the alkaloids

Weighing of Portions for Assay—In the preparation of drugs for assay all portions directed to be weighed should be weighed accurately, but with crude drugs, accuracy to the second decimal point is sufficient Portions of pilular extracts may be weighed on a piece of waxed or parch-

* Permission to reprint for purposes of comment can be had on application to the chairman of the Board of Trustees, James H. Beal, Fort Walton, Fla

mentized paper, the surplus paper cut away, and the extract and adhering paper dropped into a separator, beaker or dish containing the solvent, and the extract dissolved. In transferring weighed portions to a separator, the dish containing the material to be assayed should be thoroughly rinsed and the rinsings added to the separator.

Extraction of the Drug—The drug to be extracted should be ground to a powder of the fineness designated (from a No. 40 to a No. 80 powder) and a representative portion selected for the assay and accurately weighed. The drug must not be coarser than the size directed, although a finer powder may be used. The definition of powders will be given. Care should be taken to avoid the loss of water during the powdering of the drug. If it be impossible to avoid this loss, the drug should be dried at a low temperature before powdering, the loss of water noted and a correction made in the final calculations.

METHODS OF EXTRACTION

A By Maceration—An accurately weighed portion of the ground drug is treated with the specified solvent or mixture of solvents made alkaline with ammonia T S and thoroughly mixed and allowed to macerate for from twelve to twenty-four hours with occasional agitation, or for a shorter period with continuous agitation. At the end of this period, the drug is allowed to settle and then an aliquot portion of the solvent decanted and used for the extraction of alkaloids.

B By Percolation—An accurately weighed quantity of the ground drug is placed in a suitable container and completely saturated with the specified solvent or mixture of solvents and allowed to stand for five minutes. A sufficient quantity of ammonia T S to make the drug alkaline is added and thoroughly mixed with the drug. The moistened drug is transferred to a cylindrical percolator, previously prepared by packing the outlet with purified cotton. A small amount of the solvent may be used to rinse the container and the rinsing added to the percolator. The drug is allowed to macerate for a suitable period of time (from one to twelve hours or over night, depending upon the drug to be assayed), then the drug is firmly packed, a pledget of purified cotton placed above it and percolated slowly until the drug is completely extracted. Complete extraction of the alkaloid is determined by evaporating about 4 cc. of the last percolate to dryness, dissolving the residue in dilute acid and adding a drop of mercuric potassium iodide T S or, when testing for caffeine or colchicine, a drop of iodine T S. There should be no turbidity produced by these reagents. The percolate is then treated for the extraction of the alkaloids.

C By Continuous Extraction—An accurately weighed portion of the ground drug is placed in an extraction thimble and the thimble transferred to a suitable extractor (a Soxhlet extractor of appropriate size is satisfactory). The drug is moistened with the specified solvent and mixed by means of a stirring rod and allowed to stand about five minutes. It is then made alkaline with the specified quantity of ammonia T S and thoroughly mixed. The stirring rod is rinsed with a small portion of the solvent and the drug allowed to macerate for from six to twelve hours or over night. The drug is covered with a pledget of purified cotton and packed in the thimble, a sufficient quantity of solvent is added and the drug extracted for a specified period of time. The solvent remaining in the extraction chamber is transferred to the receiving flask and the liquid extract treated for the extraction of alkaloids.

Extraction of Alkaloids—The volume and strength of the acid to be used is usually left to the discretion of the operator. It is best, however, to keep the total volume as small as possible. For the first extraction, it is advisable to use at least 10 cc. of normal acid or sufficient to render the mixture distinctly acid; for succeeding extractions, it is preferable to use 5 cc. of normal acid and 5 cc. of distilled water. In all assays, the extraction should be continued until 0.5 cc. of the acid washings show only a very faint cloudiness on the addition of a drop of mercuric potassium iodide T S, or, in the case of caffeine and colchicine, on the addition of a drop of iodine T S.

The combined acid solutions containing the alkaloid are shaken thoroughly with the appropriate immiscible solvent and allowed to stand until the mixture has completely separated. The acid solution is then drawn off into a second separator, the immiscible solvent washed with a little distilled water and this wash water added to the acid solution. The acid solution is then made alkaline, in most cases with ammonia T S, and then extracted with several successive portions of the appropriate immiscible solvent. The volume of the latter to be used in each operation is not less than half that of the aqueous solution, and this operation must be repeated

as long as any alkaloid is extracted by the immiscible solvent To determine the completion of extraction, evaporate 1 cc of the last washing and dissolve the residue in a few drops of diluted hydrochloric acid, the resulting solution should show no turbidity on the addition of a drop of mercuric potassium iodide T S, or, in the case of caffeine and colchicine, on the addition of a drop of iodine T S The number of extractions required depends largely on the character of the alkaloid With most alkaloids it is advisable to extract three or four times before testing Phy sostigmine and pilocarpine require about twice as many extractions as other alkaloids

Determination of Alkaloids—An alkaloidal residue to be determined volumetrically should be softened by the addition of about 1 cc of alcohol or ether made neutral to the indicator used in the titration, the required amount of standard acid added, and the mixture gently warmed to insure the complete solution of the alkaloid If preferred, the alkaloidal residue may be dissolved in chloroform, the standard acid added and the chloroform removed by evaporation Before titrating add a sufficient quantity of distilled water to make the volume of the mixture measure about 25 cc When the residue is to be weighed, if the final solvent has been chloroform, the last traces of that solvent should be removed by the addition of a little ether or alcohol made neutral to the indicator used in the titration followed by evaporation Care must be taken to avoid loss by decrepitation, especially when evaporating chloroformic solutions of nux vomica or cinchona alkaloids Decrepitation may usually be prevented by the addition of a little alcohol made neutral to the indicator used in the titration after the solution has been reduced to a volume of 1 or 2 cc, evaporating at a low temperature, and rotating the container during the process

Adsorbent—In assaying fluidextracts, tinctures and other preparations of alkaloidal-bearing drugs, it is often necessary to evaporate these to dryness and, to avoid loss and to aid in the evaporation, they are usually added to some adsorbent material Paper pulp or asbestos fibre should be used for this purpose Such adsorbent material must be acid and alkali washed and then rendered neutral by washing with distilled water and dried before being used

Indicators—Methyl red T S is to be used as the indicator in volumetric estimations The same lot of indicator used in titrating the alkaloids should also be used in evaluating the standard solutions

Apparatus for Proximate Assays—When a container of definite size and shape is recommended in a proximate assay process, it is understood that this is advisory and not obligatory, except when volumetric flasks, measuring burettes or other exact measuring apparatus are specified

Aliquot Parts—When using "aliquot parts," the solvent and the aliquot part should be measured at the same temperature When handling volatile liquids, a lower temperature and a more quickly conducted operation reduces the loss from evaporation

Emulsions—The shaking or rotation of an aqueous solution with an immiscible solvent, in a separator, should ordinarily be continued for about one minute Long or violent agitation should be avoided as emulsions are likely to form Hyoscyamus, belladonna and stramonium leaves sometimes contain saponins which cause troublesome emulsions Should emulsions prove persistent, draw off the emulsified portion and add an excess of either solvent This usually breaks the emulsion and permits a complete separation It is sometimes preferable to break the separated emulsion by the addition of a small amount of anhydrous sodium sulfate If this is done it becomes necessary to wash the residue with additional solvent to completely remove the alkaloids

Emulsification is sometimes prevented by increasing the volume of the aqueous or of the immiscible solvent Chloroform or ether solutions of drugs which contain large proportions of fat may form troublesome emulsions In such cases it is advisable to add sufficient normal sulfuric acid to assure acidity and evaporate the volatile solvent while stirring with a rubber tipped glass rod When the resinous and fatty matter has been agglutinated cool the acid solution and filter it through a small, wetted filter into a separator Redissolve the residue in 15 cc of ether, add 5 cc of tenth normal acid, evaporate the ether as before, with continued stirring, and pour the acid solution through the filter into the separator Repeat the extraction of the fatty residue with dilute acid two or three times and finally wash the filter free from alkaloids

Washing—The stems of separators and funnels and the lips of flasks, separators and graduates from which volatile solvents containing alkaloids, have been drawn or poured, should be carefully washed with some of the solvent to prevent loss and to remove any of the alkaloids left by evaporation These washings should be added to the other extractions

MOISTURE DETERMINATION BY THE TOLUENE DISTILLATION METHOD

The following method has been adopted for the determination of moisture in *Asafetida* and similar drugs

Apparatus—Use a 250- to 500-cc flask of resistance glass, a 20-inch, scaled-in, straight-tube, Liebig condenser and a distilling tube receiver

The condenser and receiving tube must be chemically clean to prevent an undue quantity of water from sticking to them. Clean them with chromic-sulfuric acid solution or similar oxidizing cleaner, rinse with distilled water, then with alcohol and dry in an oven

Determination—Place in the flask an accurately weighed amount of the drug to be tested, which it is estimated will yield from 2 to 4 cc of water. If the drug is likely to cause bumping, add enough dry sand to cover the bottom of the flask. Add sufficient toluene to cover the drug completely, usually about 75 cc, and connect the apparatus. Fill the receiving tube with toluene by pouring it through the top of the condenser. Heat the toluene in the flask until it boils, and distil slowly, about two drops per second, until most of the water has passed over, then increase the rate of distillation to about four drops per second. When the water is apparently all over, wash down the condenser by pouring toluene in at the top, continuing the distillation a short time to ascertain whether any more water will distil and if it does, repeat the washing of the condenser with toluene. If any water remains in the condenser, remove it by brushing it down into the tube receiver with a tube brush attached to a copper wire and saturated with toluene, at the same time washing the condenser with toluene. Allow the receiving tube to stand until of room temperature and if any drops of water still adhere to the sides of the tube they can be forced down by a rubber band wrapped around a copper wire. Finally read the volume of water and calculate to determine the percentage

Assay of *Asafetida*—To yield not less than 50 per cent of alcohol soluble extractive

Place about 2 Gm of *Asafetida*, accurately weighed, in a tared extraction thimble and extract with alcohol in a Soxhlet apparatus or other suitable extraction apparatus for three hours or until completely extracted. Dry the insoluble residue at 100° C for thirty minutes and weigh. Determine the amount of moisture in the drug by the toluene distillation method, calculate the weight of moisture in the *Asafetida* and subtract this weight of moisture from the original weight of the *Asafetida* taken for the assay. The difference between this result and the weight of the residue determined above represents the alcohol-soluble extractive

Assay of *Aloe*—This drug has received a great deal of careful study, both from the chemical assay and from the physiological effect on daphnia. However, no satisfactory method has yet been devised for assaying this drug

Assay of *Aspidium*—Prepare an ethereal extract as directed under Oleoresin of *Aspidium*, using 125 Gm of the drug. Assay as directed under Oleoresin of *Aspidium*. *Aspidium* yields not less than 6.5 per cent of oleoresin and not less than 1.5 per cent of crude filicin

Assay of Oleoresin of *Aspidium*—Warm the Oleoresin on a water bath and stir until it is thoroughly mixed. Transfer about 3 Gm of it, accurately weighed, to a 250 cc flask, dissolve it in 40 cc of ether, add 75 cc of a 3 per cent aqueous solution of barium hydroxide, and shake the mixture vigorously for five minutes. Transfer the mixture to a separator, allow the liquids to completely separate, and draw off and filter the barium hydroxide layer. Rinse the 250 cc flask with two 25 cc portions of a 3 per cent aqueous barium hydroxide solution. After each rinsing, transfer the barium hydroxide solution to the separator, shake the mixture for one minute, allow the liquids to separate completely and draw off and filter the barium hydroxide layer. Transfer the combined filtered barium hydroxide solutions to a separator, render distinctly acid to litmus paper by the addition of hydrochloric acid, and extract with three successive portions of 30 cc, 20 cc and 15 cc of ether. Filter the combined ethereal solutions, wash the filter with ether, evaporate and dry the residue to constant weight at 100° C. This residue is calculated as crude filicin and its weight should be not less than 24 per cent of the weight of Oleoresin taken for the assay

Assay of *Belladonna Leaves*—Proceed as directed under Assay of *Hyoscyamus*

Assay of Extract of *Belladonna Leaves*—A. *Pilular*—Proceed as directed under Assay of *Pilular Extract of Hyoscyamus*. B. *Powdered*—Proceed as directed under Assay of *Powdered Extract of Hyoscyamus*

Assay of Tincture of Belladonna—Proceed as directed under Assay of Tincture of Hyoscyamus, with slight modifications

Assay of Belladonna Root—Proceed as directed under Assay of Hyoscyamus

Assay of Fluidextract of Belladonna Root—To 10 cc of fluidextract of belladonna root add 10 cc of approximately tenth-normal acid and 10 cc of distilled water and evaporate on a water bath to about 10 cc. Then add 10 cc of distilled water and proceed as directed under Assay of Hyoscyamus, beginning with the words 'filter this mixture'

Assay and Standard of Belladonna Ointment—Ointment of Belladonna yields not less than 0.118 per cent and not more than 0.132 per cent of the alkaloids of belladonna leaves

Assay Accurately weigh about 25 Gm of the well mixed Ointment and transfer it completely to a 250 cc separator having a pledget of purified cotton packed loosely in the stem. Add 100 cc of ether-chloroform mixture (ether, four parts and chloroform, one part) and shake the mixture vigorously until all of the fats have been dissolved. Extract the alkaloids from the mixture with five successive 20-cc portions of 2 per cent sulfuric acid. Draw off each portion of the clear acid solution into a small separator containing 10 cc of ether. Wash each acid extraction successively through this same 10 cc of ether and draw off the acid solutions into another 250-cc separator. Render the combined acidified solutions alkaline with ammonia T S and extract the alkaloids completely by shaking out with successive, 25 cc portions of chloroform, testing for complete extraction as directed under *Proximate Assays*. Allow each portion to settle, and then filter through purified cotton, wetted with chloroform, into a 250 cc beaker, finally washing the stem of the separator and the filter with a little chloroform. Evaporate the chloroform from the combined solutions by warming at a moderate heat on a water-bath until it is reduced to a volume of about 10 cc. Add a measured excess (about 10 cc) of fiftieth normal sulfuric acid, stir the mixture, and continue the evaporation until all of the chloroform has been expelled. Add 20 cc of recently boiled and cooled distilled water and one drop of methyl red T S and titrate the excess of acid with fiftieth normal sodium hydroxide. Each cc of fiftieth-normal sulfuric acid is equivalent to 0.00578 Gm of the alkaloids of belladonna leaves

Assay of Belladonna Plaster—Belladonna Plaster is a mixture of adhesive plaster mass and an extract prepared from belladonna root, spread evenly upon fine cotton cloth or other suitable backing material. The plaster mass yields not less than 0.25 per cent and not more than 0.30 per cent of the alkaloids of belladonna

Each 100 square centimeters of the spread plaster contains at least 2.5 Gm of the belladonna plaster mass

Assay Same as in U S P X except for the following changes. An extra washing of the cloth and beaker, the precipitated rubber is kneaded with a glass rod to force out any chloroform alcohol solution, the cotton pledget is pressed to remove the rest of the solvent, the residue is dissolved in 5 cc of chloroform made neutral to methyl red T S, 10 cc of fiftieth normal acid added and the chloroform evaporated on a water-bath and then the excess of acid titrated with a fiftieth normal alkali

Assay of Benzoinum—

Assay Place about 2 Gm of Benzoin, accurately weighed, in a tared extraction thimble and extract with alcohol containing 0.5 per cent of sodium hydroxide in a Soxhlet apparatus or other suitable extraction apparatus for five hours, or until completely extracted. Dry the insoluble residue at 100° C for thirty minutes and weigh. Determine the amount of moisture in the drug by the toluene distillation method; calculate the weight of moisture in the Benzoin and subtract this weight of moisture from the original weight of the Benzoin taken for the assay. The difference between this result and the weight of the residue determined above represents the alcohol soluble extractive

Assay of Cinchona—Place 5 Gm of Cinchona, in 'fine powder' and 15 cc of 3 per cent hydrochloric acid in a 500 cc flask and heat the mixture on a water bath for one hour. Cool and add 200 cc of ether-chloroform solution (ether 4 volumes chloroform 1 volume) and 10 cc of stronger ammonia T S. Stopper the flask tightly and shake it for one hour in a mechanical shaker. Allow the mixture to stand over night, again shake it for one half hour, and then allow the drug to settle. (If the supernatant liquid is not clear, add a few cc of distilled water, again shake the contents of the flask vigorously and allow the drug to settle.)

Quickly decant 160 cc of the clear, ether-chloroform solution, measured at approximately

the same temperature as the original menstruum and representing 4 Gm of the drug Transfer the solution to a separator, rinse the measuring vessel with a small quantity of the ether chloroform solution and add the rinsings to the separator Completely extract the alkaloids with approximately 5 per cent sulfuric acid and collect the acid solution of the alkaloids in a second separator

Make the acid solution strongly alkaline with ammonia T S and completely extract the alkaloids with chloroform Evaporate or distil the chloroform in a tared beaker or flask and dry the alkaloidal residue to constant weight at 100° C The weight obtained, multiplied by 25, represents the per cent of the alkaloids of cinchona in the drug

Assay of Compound Tincture of Cinchona—Evaporate 50 cc, accurately measured, of Compound Tincture of Cinchona, to about 10 cc at a temperature not exceeding 100° C Add sufficient asbestos fiber or paper pulp to absorb the liquid and continue the evaporation to dryness Transfer the residue to a flask or bottle, add 200 cc, accurately measured and at room temperature, of ether-chloroform mixture (ether 4 volumes, chloroform 1 volume) and sufficient ammonia T S (which may be used to rinse out the adhering portions of the Tincture from the evaporating dish) to render the mixture strongly alkaline Securely stopper the container and shake it mechanically during one hour, or intermittently during two hours and then allow the mixture to stand over night Again shake the mixture intermittently for half an hour, allow it to settle, quickly decant 160 cc (representing 40 cc of the Tincture) of the approximately clear liquid Filter this into a separator and wash the measuring vessel with sufficient of the original menstruum, adding the rinsings to the separator Extract the alkaloids from the clear liquid with acidulated water, using sufficient dilute sulfuric acid to render the contents of the separatory funnel and each extract distinctly acid to litmus paper Pass the acid extracts in succession through a wetted, double filter into a second separator Render the combined liquids distinctly alkaline with stronger ammonia T S and extract with chloroform Pass the chloroformic extracts through a double filter, which is kept saturated with chloroform, into a suitable, tared receptacle Evaporate the chloroform on a water bath, dry the residue to constant weight at 100° C and weigh The weight multiplied by 2.5 represents the weight of alkaloids in 100 cc of the Compound Tincture of Cinchona

Assay of Colchicum Seed—U S P X process is continued with only minor changes in the wording

Assay of Ginger and Fluidextract of Ginger—The standards and assays are as follows

Ginger contains not less than 4.5 per cent of ether-soluble extractive

Assay Place 20 Gm of Ginger, in moderately coarse powder, in an extraction thimble in a Soxhlet or similar extractor Extract with ether for six hours, evaporate the liquid on a water-bath until the odor of ether is no longer perceptible, and place the container in a desiccator for twelve hours or over night and then weigh The weight of the extract should be not less than 0.90 Gm

Only Jamaica Ginger will be recognized in the forthcoming pharmacopœia

Fluidextract of Ginger contains, in each 100 cc, not less than 4.5 Gm of ether-soluble extractive

Assay Place 20 cc of Fluidextract of Ginger in a 200-cc beaker Place this on a water-bath and evaporate the liquid until there is no longer any odor of alcohol Remove it from the bath and add 50 cc of ether Stir the contents of the beaker with a stirring rod to dissolve the soluble resin and decant the ether through a dry, 9-cm filter into a tared 200 cc beaker Repeat the extraction two or three times, using 50-cc portions of ether Finally wash the filter with a small amount of ether and evaporate the combined ethereal extractions on a water-bath until the odor of ether is no longer perceptible Place the container in a desiccator for twelve hours or over night and then weigh The weight of residue shall not be less than 0.90 Gm

Assay of Hyoscyamus—To yield not less than 0.040 per cent of the alkaloids of hyoscyamus by the new assay The U S P X assay gave a larger yield but the substance estimated was not all alkaloidal

As indicated above it was necessary to change the assay process of this drug because of the volatile amines present and this assay process is made the basis for the assay of all mydriatic drugs and their preparations The process is as follows

Place 25 Gm of Hyoscyamus, in fine powder, in an extraction thimble, insert the thimble

in a Soxhlet extractor, moisten the drug with a mixture of 8 cc of stronger ammonia T S, 10 cc of alcohol and 20 cc of ether and mix thoroughly. Macerate the mixture over night then extract it for not less than three hours, on a water bath, using ether as the solvent. The following alternative process may be used. Moisten 25 Gm of *Hyoscyamus* in fine powder, with a mixture of 8 cc of stronger ammonia T S, 20 cc of ether and 10 cc of chloroform in a small percolator, previously prepared by packing the outlet with a pledget of purified cotton. Macerate the mixture over night, pack it in the percolator and extract the drug by slowly percolating with a mixture of 3 parts of ether and 1 part of chloroform. Continue the percolation until the 3 or 4 cc of percolate last passed, when evaporated to dryness and the residue dissolved in dilute sulfuric acid, fails to become turbid when treated with mercuric potassium iodide T S. Evaporate the extractive obtained by either method, to about 15 cc, then add 10 cc of approximately tenth normal sulfuric acid and 10 cc of distilled water and continue the evaporation until the volatile solvents are removed. Filter this mixture, collecting the filtrate in a separator, dissolve the chlorophyll residue in chloroform, add acidulated water, evaporate on a water-bath until the chloroform is removed and filter into the same separator through the filter previously used. Render the mixed filtrates alkaline with ammonia T S and remove the alkaloids by extracting with chloroform, testing for the complete extraction of the alkaloids. Evaporate or distil the chloroform from the combined extractions until reduced to a small volume, then evaporate to dryness on a water-bath and keep at this temperature for fifteen minutes. Dissolve the residue in chloroform, evaporate to dryness on a water-bath and continue the heating for fifteen minutes. Repeat this treatment for the third time. Dissolve the resulting residue in chloroform, add 15 cc of fiftieth-normal sulfuric acid, remove the chloroform by evaporation and titrate the excess acid with fiftieth-normal sodium hydroxide, using methyl red T S as the indicator. Each cc. of fiftieth-normal acid is equivalent to 0.00578 Gm of the alkaloids of *Hyoscyamus*.

Assay of Pilular Extract of Hyoscyamus—To yield not less than 0.135 per cent and not more than 0.175 per cent of the alkaloids of *hyoscyamus*.

Dissolve approximately 5 Gm of *Pilular Extract of Hyoscyamus*, accurately weighed (see Proximate Assays, for method of weighing) in 10 cc of chloroform add 10 cc of approximately tenth-normal sulfuric acid and 10 cc of distilled water and evaporate the mixture on a water-bath until the chloroform is removed. Complete the assay as directed under *Hyoscyamus* beginning with the words "Filter this mixture, collecting the filtrate in a separator." Each cc of fiftieth-normal acid is equivalent to 0.00578 Gm of the alkaloids of *hyoscyamus*.

Assay of Powdered Extract of Hyoscyamus—To yield not less than 0.135 per cent and not more than 0.175 per cent of the alkaloids of *hyoscyamus*.

Dissolve 5 Gm of *Powdered Extract of Hyoscyamus* in 10 cc of chloroform, add 10 cc of approximately tenth-normal sulfuric acid and 10 cc of distilled water and evaporate the mixture on a water-bath, until the chloroform is removed. Complete the assay as directed under *Hyoscyamus*, beginning with the words "Filter this mixture, collecting the filtrate in a separator." Each cc of fiftieth-normal acid is equivalent to 0.00578 Gm of the alkaloids of *hyoscyamus*.

Assay of Tincture of Hyoscyamus—Each 100 cc to yield not less than 0.0034 Gm and not more than 0.0046 Gm of the alkaloid of *hyoscyamus*.

Evaporate approximately 250 cc, accurately measured, of *Tincture of Hyoscyamus* at a temperature not exceeding 80° C, to about 25 cc. Add 10 cc of approximately tenth normal sulfuric acid and 10 cc of distilled water and complete the assay as directed under *Hyoscyamus* beginning with the words "Filter this mixture, collecting the filtrate in a separator."

Each cc of fiftieth-normal acid is equivalent to 0.00578 Gm of alkaloids of *Hyoscyamus*.

Assay of Ipecac—Place 10 Gm of *Ipecac* in fine powder" in a dry, 250-cc flask. Add 100 cc of ether which is free from peroxide stopper the flask shake the mixture thoroughly and allow it to stand for five minutes, then add 10 cc of ammonia T S. Again stopper the flask tightly and shake it for one hour in a mechanical shaker or intermittently during two hours. Allow the mixture to stand over night, again shake it intermittently during one-half hour and then allow the drug to settle. Decant into a separator 50 cc, accurately measured, of the clear, supernatant liquid (representing 5 Gm of drug) and rinse the vessel with a small quantity of ether.

Completely extract the alkaloids from this ethereal solution with approximately normal sulfuric acid, preferably using 15 cc the first time and 10 cc on each succeeding extraction, and

filtering each portion into a second separator Continue the extraction until no reaction can be detected in the sulfuric acid solution when tested as directed in the General Article on Proximate Assays

To the combined acid solutions add about an equal volume of peroxide free ether, render the mixture alkaline by the addition of ammonia T S and extract with successive portions of the ether until no visible reaction takes place when tested as directed above Filter each portion of the ethereal extract into a 200 cc flask or beaker and carefully evaporate the combined ethereal solutions on a steam bath, until nearly but not quite dry Add 5 cc of the peroxide free ether and again evaporate nearly to dryness Add 10 cc of tenth-normal sulfuric acid and heat on a steam-bath to effect complete solution and to remove all of the ether Cool and titrate the excess of acid with tenth-normal sodium hydroxide, using methyl red T S as the indicator Each cc of tenth-normal sulfuric acid is equivalent to 0.0240 Gm of the ether-soluble alkaloids of Ipecac

Assay of Fluidextract of Ipecac—Each 100 cc to yield not less than 1.55 Gm and not more than 1.90 Gm of the ether-soluble alkaloids of ipecac

Transfer 10 cc of Fluidextract of Ipecac, accurately measured, to an evaporating dish containing either absorbent paper or asbestos and dry at a temperature not exceeding 60° C Transfer the absorbent to a flask containing 100 cc of peroxide-free ether, stopper the flask, shake well and allow the mixture to stand for five minutes Then add 10 cc of ammonia T S using a portion of the ammonia T S to rinse traces of the absorbent from the evaporating dish Stopper the flask tightly and shake the mixture during one hour in a mechanical shaker, or occasionally, by hand, during a period of about two hours Allow the mixture to stand over night and again shake it occasionally during a one-hour period Allow the absorbent to settle and decant exactly 50 cc (representing 5 cc of the Fluidextract) of the clear supernatant liquid into a separator Completely extract the alkaloids from the ethereal solution with approximately normal sulfuric acid, filtering each portion into a second separator and test for complete extraction as directed under Proximate Assays Render the combined acid solution alkaline with ammonia T S, extract with successive portions of peroxide-free ether and again test for complete extraction Filter the ethereal extracts into a flask or beaker and evaporate them carefully on a steam-bath, nearly, but not quite, to dryness Add 5 cc of ether and again evaporate nearly to dryness Add 10 cc of tenth-normal sulfuric acid and heat on a steam-bath to effect complete solution and to remove all of the ether Cool, and titrate the excess of acid with tenth-normal sodium hydroxide, using methyl red T S as the indicator Each cc of tenth-normal sulfuric acid is equivalent to 0.0240 Gm of the ether-soluble alkaloids of ipecac

Assay of Nux Vomica—To yield not less than 1.15 per cent of strychnine

Place 15 Gm of Nux Vomica, in coarse powder, in a flask or bottle, add 150 cc of a mixture of 3 volumes of ether and 1 volume of chloroform, agitate the mixture and allow it to stand for about two minutes Then add 10 cc of stronger ammonia T S, agitate thoroughly, stopper the container securely and shake frequently, but gently, during one hour Now allow the mixture to stand for twelve hours or over night in a cool place At the expiration of this period, shake the container gently for fifteen minutes, and then allow it to separate Decant 100 cc of the liquid (representing 10 Gm of Nux Vomica), and transfer it to a separator, rinsing the container with a little chloroform and adding the rinsings to the separator Now add about 40 cc of approximately normal sulfuric acid to the separator and shake the mixture gently for five minutes, then allow the liquids to separate and draw off the acid layer into another separator and repeat with successive portions of the acid, until the drug is completely extracted (Test for the complete extraction of the alkaloids)

To the combined acid solutions in the separator, add a small piece of red litmus paper and 50 cc of chloroform, and follow with sufficient ammonia T S to render the aqueous layer alkaline and, after gently shaking, add 2 or 3 cc more of the ammonia T S Now shake the mixture thoroughly but gently for about ten minutes, and allow the liquids to separate Draw off the chloroform into a container and repeat, with additional portions of chloroform, until all of the alkaloid is extracted

Carefully evaporate the combined chloroformic extracts to dryness on a steam bath, dissolve the residue by warming with 15 cc of approximately 3 per cent sulfuric acid, cool and then add 3 cc of a mixture of equal parts of nitric acid and a 5 per cent solution of sodium nitrite

in distilled water, stir well and allow to stand for exactly ten minutes at room temperature. At the expiration of this period pour the red solution into a separator containing 50 cc of chloroform, rinse the flask with distilled water and add the rinsings to the separator. Now immediately add sufficient 10 per cent sodium hydroxide solution to make the contents of the separator distinctly alkaline to litmus paper, and then add a few cc more of the hydroxide solution. Shake the mixture gently for ten minutes and allow the liquids to separate. Draw off the chloroformic layer into another separator and repeat the shaking out with additional portions of chloroform until the alkaloids are completely extracted. Add 10 cc of distilled water to the combined chloroformic extract, shake the mixture gently and add a small piece of red litmus paper. The litmus paper should indicate not more than a slight alkalinity. Draw off the chloroform, passing it through a filter paper, moistened with chloroform, into a container. Shake the residual water with 5 cc more of chloroform, separate this chloroform and add it to that previously separated. Wash the filter paper with warm chloroform and add it also to the container. If the water, after shaking with the chloroform, is strongly alkaline draw off the chloroform into another separator and shake it with another 10 cc of distilled water. Now shake out the combined water extract with 5 cc of chloroform and draw off all of the chloroform through a chloroform-moistened filter paper as before.

Evaporate the combined chloroform very carefully on a steam-bath nearly, but not quite, to dryness. Add to the moist residue 6 cc of tenth normal sulfuric acid and follow by 30 cc of distilled water. Heat the mixture on a steam-bath until the alkaloid is dissolved and the odor of chloroform is dissipated. Cool to room temperature and titrate the excess of acid with tenth normal sodium hydroxide using one drop of methyl red T S as the indicator. Each cc of tenth normal sulfuric acid is equivalent to 0.03342 Gm of strychnine.

Assay of Extract of Nux Vomica—To yield not less than 7.0 per cent and not more than 7.75 per cent of strychnine.

Place about 1.5 Gm of Extract of Nux Vomica accurately weighed, in a dish and digest it on a water-bath with about 10 cc of diluted alcohol acidulated with acetic acid until the extract has liquefied. Transfer the solution to a separator containing 25 cc of chloroform and wash the dish with successive small portions of diluted alcohol adding the rinsings to the separator. Dilute the alcoholic liquid with an equal amount of distilled water, render it alkaline with ammonia T S, and completely extract the alkaloids with successive portions of chloroform. Then proceed as directed under the *Assay for Nux Vomica* beginning with the words "Carefully evaporate the combined chloroform extracts." Each cc of tenth normal sulfuric acid is equivalent to 0.03342 Gm of strychnine.

Assay of Tincture of Nux Vomica—Concentrate 100 cc of Tincture of Nux Vomica to about 10 to 20 cc by evaporating it at a temperature not exceeding 60° C. Transfer the concentrated liquid to a separator containing 25 cc of chloroform and rinse all traces of liquid from the dish, using small portions of diluted alcohol and adding the rinsing to the separator. Add a volume of distilled water equal to that of the alcoholic liquid render the solution alkaline with ammonia T S and completely extract the alkaloids by shaking out with successive portions of chloroform. Then proceed as directed under the *Assay for Nux Vomica* beginning with the words "Carefully evaporate the combined chloroform extracts" etc.

The number of cc of tenth normal sulfuric acid consumed, multiplied by 0.03342 indicates in grams the amount of strychnine in 100 cc of the Tincture.

Assay of Opium Granulated Opium and Powdered Opium—This is essentially the U S P X assay process except that the morphine crystals are washed with 'morphinated' water instead of distilled water.

Assay of Tincture of Opium—Essentially the same as the U S P X assay process except as indicated above in the *Assay of Opium*.

Assay of Camphorated Tincture of Opium—This is the first time that an assay process has been included in the U S P for this preparation. The process is as follows:

Each 100 cc to yield not less than 0.035 Gm and not more than 0.045 Gm of anhydrous morphine.

To 100 cc of the Tincture add 2 cc of approximately normal sulfuric acid, evaporate the mixture on a water bath to about 10 cc and transfer the residue to a separator. Wash the evaporating dish with portions of about 10 cc of a mixture of equal volumes of normal sulfuric

acid and distilled water, and add the washings to the separator. If necessary, wash the dish with several cc of a mixture of 85 volumes of chloroform and 15 volumes of alcohol, adding these washings to the liquid in the separator. To this mixture add about 9 Gm of sodium chloride and carefully neutralize to litmus paper by adding stronger ammonia water, and then add several drops in excess. Add 130 cc of a mixture of 85 volumes of chloroform and 15 volumes of alcohol, shake the contents of the separator and then allow the mixture to completely separate.

Transfer the immiscible solvent portion to a second separator and extract the remaining aqueous solution with successive portions of the chloroform alcohol mixture until a negative test for morphine is obtained with sulfuric acid formaldehyde T S. Collect the extractions in the second separator. If more than four extractions are required, increase the quantities and volumes of all separator reagents so as to maintain the proportions here prescribed.

Dissolve 25 Gm of sodium hydroxide in 1000 cc of distilled water, saturate the solution with sodium chloride, filter and add 15 cc of this alkaline salt solution to the chloroformic alcohol extract just prepared. Remove the morphine by shaking with several successive portions of alkaline salt solution, collecting the latter. Wash the combined alkaline salt solutions with 10 cc of chloroform and discard the chloroform. Exactly neutralize the alkaline salt solution to litmus paper by adding hydrochloric acid, and finally add a slight excess of acid. Cool the solution to 25° C, shake it with 10 cc of chloroform. Remove the chloroform to another separator and shake it with 5 cc of saturated sodium chloride solution to which a few drops of hydrochloric acid have been added. Discard the chloroform and add the acid salt solution to the combined salt solutions.

Now add stronger ammonia T S to the combined salt solutions until it is neutral to litmus paper and then add a slight excess of the ammonia. Cool the solution to 25° C and immediately extract the alkaloids with successive portions of the chloroform alcohol mixture. Filter each extraction into a container through purified cotton wetted with the chloroform alcohol mixture and, when completely extracted, discard the liquid in the separator.

Evaporate the combined chloroformic solutions on a water-bath to a volume between 1 cc and 15 cc. Add 10 cc of alcohol neutral to methyl red T S to the residue and warm the mixture to dissolve the alkaloids and to remove the last traces of chloroform. Add 1 drop of methyl red T S and then a measured excess of fiftieth normal sulfuric acid. *Guard against the presence of undissolved particles.* Cool and add 15 to 20 cc of recently boiled and cooled distilled water. Titrate the excess of acid with fiftieth normal sodium hydroxide which is sufficiently free from carbonate to insure a sharp end-point with methyl red T S as the indicator. Each cc of fiftieth normal sulfuric acid corresponds to 0.00571 Gm of anhydrous morphine.

Assay of Podophyllum—Considerable study was given to the assay process of podophyllum and the following process is recommended.

To yield not less than 4 per cent of resin of podophyllum.

Place 10 Gm of Podophyllum, in fine powder, in a 125 cc Erlenmeyer flask and add 35 cc of alcohol. Fit a stopper with a glass tube for refluxing (a reflux condenser may be substituted) and heat on a water bath for three hours. Transfer the mixture to a small percolator and percolate slowly with warm alcohol until the percolate measures 95 cc. Cool, add sufficient alcohol to make the volume exactly 100 cc and mix thoroughly.

Transfer 10 cc of this percolate to a separator, and add 10 cc of chloroform and 10 cc of 0.6 per cent hydrochloric acid. Shake the mixture, allow it to separate, draw off the alcohol-chloroform layer into a second separator, and then wash the acid layer three times with successive 15 cc portions, of an alcohol chloroform mixture prepared from one volume alcohol and two volumes of chloroform, adding the washings to the second separator. Add 10 cc of 0.6 per cent hydrochloric acid to the combined extracts and washings, again shake the mixture, allow it to separate and draw off the alcohol chloroform layer into a tared vessel. Wash the acid layer three times with 15 cc portions of the alcohol chloroform mixture adding the washings to the tared vessel. Evaporate the combined extractions on a water-bath to apparent dryness, add 1 cc of dehydrated alcohol and again evaporate to dryness and then to constant weight at 80° C. The weight of this residue, multiplied by 100, indicates the per cent of resin in the drug.

Assay of Stramonium—To yield not less than 0.30 per cent of the alkaloids of stramonium. Proceed as directed under Assay of Hyoscyamus.

Assay of Extract of Stramonium—To yield not less than 1 10 per cent and not more than 1 30 per cent of alkaloids of stramonium

Pilular Proceed as directed under Assay of Pilular Extract of Hyoscyamus

Powdered Proceed as directed under Assay of Powdered Extract of Hyoscyamus

Assay of Tincture of Stramonium—Each 100 cc to yield not less than 0 027 Gm and not more than 0 033 Gm of alkaloids of stramonium

Proceed as directed under Assay of Tincture of Hyoscyamus

A CORRECTION

An error was made in transcribing the notes on our calomel article, *Jour A Ph A* 24, 97-102 (1935)

On pages 101 and 102 wherever the μ sign is used, it should read 1/1000 inch

Will you please make this correction some time this year so that the correction will appear in the same volume as the article?

(Signed) CHARLES H LAWALL

CANCER RESEARCH

Report was made at the American Chemical Society meeting in San Francisco, of apparent success in treating cancer by means of lead phosphate administration to a degrec producing lead intoxication

BLINDNESS CAUSED BY USE OF DINITROPHENOL

W G Campbell, Chief of the Food and Drug Administration, has issued a Bulletin on the above subject. The statement is made that eye cataracts observed in dinitrophenol poisoning develop with rapidity and result in total blindness within a comparatively short time. The symptoms of the poisoning are nausea, stomach and intestine disturbance, high fever, rapid breathing and muscular rigor, followed by death

Mr Campbell states that the cases of progressive blindness recently reported in California are the result of medication with dinitrophenol. The statement is also made that dinitrophenol is sold under fanciful names and the statement is made that if the preparation contains the drugs it may not be known to the seller nor to the buyer. Purchaser should be advised regarding the dangers which follow the use of the drug

BANG'S DISEASE IN CATTLE

Testing to eradicate Bang's Disease in cattle is under way in nearly all states. The work is conducted by the Bureau of Animal Industry

A total of 250 herds showed one or more reactors and retesting is now under way

PHARMACOLOGICAL AND VITAMIN LABORATORY

Dr Walter G Campbell, chief of the Food and Drug Administration, has stated that the work of the Pharmacological and Vitamin Laboratory will be expanded. The work will include bioassay and other drug studies, investigation of the toxic effects of fruit spray residues and examination of food and drug vitamin products

MORPHINE ADDICTION

Drs O H Plant and D Slaughter, of the State University of Iowa, reported to the American Society for Pharmacology and Experimental Therapeutics that the development of tolerance is one of the tests for judging the morphine substitutes. Dinitrophenol stimulates oxidation, the process by which the body burns food or other fuel to get energy, it increases the burning of morphine in the bodies of dogs that had no tolerance for the latter drug. In morphine tolerant dogs, the general burning of oxidation process was speeded up by dinitrophenol, but judging from the fact that there was no decrease in the amount of morphine excreted, it appears that the burning of morphine itself was not affected by dinitrophenol in tolerant dogs. Consequently the investigators assume that the dog's body handles morphine differently when it has become used to the narcotic

BRITISH PHYSICIANS VISIT UNITED STATES

Fifty-five British physicians, with members of their families making a group of 110, visited New York, Washington, Chicago, Albuquerque, the Grand Canyon, Los Angeles and San Francisco between August 4th and 14th, on their way to the annual session of the British Medical Association in Melbourne, Australia in September

EDITORIAL NOTES

PLEASE NOTE

Owing to the large number of Addresses, Council Business and Reports, the Editorial Notes and matter usually following have been omitted. The lateness in receiving some of them and the fact that the September issue of the JOURNAL will soon be completed, these pages will be included in that issue. For Roster of Associations, Boards, etc.—see July JOURNAL.

NOMINEES FOR A PH A OFFICERS, 1936-1937

For *President*, George D. Beal, Pittsburgh, Pa.; John Culley, San Francisco, Calif.; E. Fullerton Cook, Philadelphia, Pa. For *First Vice-President*, W. J. Husa, Gainesville, Fla.; J. Leon Lascoff, New York, N. Y.; H. W. Youngken, Boston, Mass. For *Second Vice-President*, A. O. Mickelsen, Portland, Ore.; E. R. Serles, Brookings, S. D.; James C. Munch, Philadelphia, Pa.

Three will be elected from the following nine nominees for places on the Council: W. D. Adams, Forney, Tex.; F. E. Bibbins, Indianapolis, Ind.; W. Mac Childs, Topeka, Kan.; H. C. Christensen, Chicago, Ill.; C. J. Clayton, Denver, Colo.; C. H. Evans, Warrenton, Ga.; R. P. Fischelis, Trenton, N. J.; Ernest Little, Newark, N. J.; A. L. I. Winne, Richmond, Va.

NATIONAL PHARMACY WEEK

National Pharmacy Week will be held during the week of October 21st, the change of date is made largely in order to give colleges of pharmacy time in which to prepare for the annual event. Honorable mention certificates and prizes will be offered for window displays. The Washington, D. C., Wholesale Drug Exchange has announced a prize of a balance and honorable mention certificates will be offered by the National Association of Retail Drug-gists and the AMERICAN PHARMACEUTICAL ASSOCIATION.

We have had a number of inquiries regarding Pharmacy Week maps from private and public schools and are advised that Secretary E. L. Newcomb of the N. W. D. A. still has a number of these maps; pharmacists should make application from their wholesale druggists.

UNITED STATES CIVIL SERVICE EXAMINATION

The United States Civil Service Commission has announced an open competitive examination for Associate Electrochemist. Applications for the position of associate electrochemist must be on file with the U. S. Civil Service Commission, Washington, D. C., not later than September 16, 1935. At present there is a vacancy in this position in the Bureau of Chemistry and Soils, Department of Agriculture.

The entrance salary is \$3200.00 a year, less a deduction of $3\frac{1}{2}$ per cent toward a retirement annuity.

Applicants must have been graduated with a bachelor's degree from a college or university of recognized standing upon the completion of at least 118 semester hours, of which at least 30 semester hours must have been in chemistry. In addition, they must have had at least three years' experience, acquired since graduation, of a progressive specialized technical character in electrochemical manufacturing plants, preferably in the production of chlorine, chlorates or persulphates. Such experience must have necessitated a thorough knowledge of electrochemistry and must have involved familiarity with and responsibility for plant operation and production costs. The major portion of the experience must have been obtained within the 10 years immediately preceding the date of the close of receipt of applications.

Full information may be obtained from the secretary of the United States Civil Service Board of Examiners at the post-office or custom house in any city which has a post-office of the first or the second class, or from the United States Civil Service Commission, Washington, D. C.

INTERNATIONAL CONGRESS OF PHARMACY

The Twelfth International Congress of Pharmacy was held in Brussels during the week of July 29th. M. Pattou, President of the National Pharmaceutical Society of Belgium, and also the Congress, presided at the meeting and the opening ceremonies were attended by the King and Queen of Belgium. There were also present the French and Bra-

zilian Ambassadors and dignitaries from a number of countries

President Pattou explained the objects of the Conference and spoke of Pharmacy as a profession, possessing equal rank with the other learned professions of the world

Dr J Bruegelmans gave a history of the Conference and referred to the participating countries in the organizations represented and that the reports of the Conference should be printed in the respective publications

A meeting was held for the discussion of the International Pharmacopœias, at which time papers were read by the participants of the Congress among these a report was made by Prof Oscar Van Schoor, secretary of the International Pharmacopœia Commission

Following a discussion it was decided that the League of Nations would be asked to establish a commission for the production of an International Pharmacopœia and that the meetings of the Commission be held in Brussels A general opinion prevailed that the first International Pharmacopœia should be limited to a description of certain reagents and methods of analysis on which the participants are in agreement Discussions were also held and other discussions dealt with army pharmaceutical service

PERSONAL AND NEWS ITEMS

Dr Marshall A Howe was appointed director of the New York Botanical Gardens, succeeding Dr Elmer D Merrill

The Ebert award a gold medal, was presented to Marvin J Andrews, of the faculty at the University of Maryland, for a meritorious scientific research paper—"Determination of the Reasonable Permissible Margin of Error in Dispensing," at the annual convention in Portland, Oregon, of the AMERICAN PHARMACEUTICAL ASSOCIATION

H C Christensen of Chicago, was given a plaque in recognition of his services in handling exhibits at the Chicago World's Fair

The bulletin of W Bruce Philp for August 9th gives available information relative to weighing and measuring, the purpose being to insure accuracy in prescription practice

William A Noyes, *emeritus director* of the laboratories of the University of Illinois, received the Priestley medal highest award of the American Chemical Society at the general session of the meeting of the society, August 19th in San Francisco The subject of his medalist

address was "The Way Forward in Chemistry"

F W Meissner, La Porte, Ind, had his 50th display at the La Porte County Fair His booth on this occasion was decorated in gold trimming

Hon Frank J Kobelak, of the Pennsylvania Legislature, whose fair trade bill was signed by Governor Earle, is a druggist of Pittsburgh

An organization has been formed for the study of problems associated with phenol phthalein, the research activities will be under direction of Dr Bernard Fantus, assisted by a research staff at the University of Illinois

The memorial of the late Dr F B Kilmer will be perpetuated by a Memorial Garden being planned by the Philadelphia College of Pharmacy and Science east of the college building

Frederick G Zinser was born in New York N Y, March 20, 1868 received his primary education in the public schools of New York, N Y, after which he attended Columbia University, from which he graduated with the class of 1888 Subsequently he spent several years in Louvain Gottingen and Heidelberg where, in 1891, he obtained the degree of doctor of philosophy Dr Zinser has been elected president of Sharp & Dohme

John A Gerlach, Baltimore Md, presented a Prescription Balance to the Museum of the American Institute of Pharmacy

We congratulate Mr and Mrs Lyman W Griffin upon the completion of a half century of life together Lyman Griffin started in the drug business in 1874 entering the Massachusetts College of Pharmacy in 1879 and graduating in 1882 He was made a life member of his alma mater, served as its secretary for twenty-five years and is now a vice president of the college After more than sixty years in retail pharmacy he is now actively engaged in the management of The J G Godding store in Boston He has given generously of his time and effort to pharmaceutical organizations he is a member of the AMERICAN PHARMACEUTICAL ASSOCIATION, and for many years has been treasurer of both the Massachusetts State Pharmaceutical Association and the Boston Association of Retail Druggists

Dr Frank Lee Pyman is to receive the Hanbury Medal for 1936

SEVENTH AMERICAN SCIENTIFIC CONGRESS

The Seventh American Scientific Congress will be held in Mexico City Mexico, Septem

ber 8th to 17th The president of the organization is Pedro C Sanchez Besides the scientific program, interesting entertainment events have been arranged for, our fellow-member G G Colin desires to have publicity given of the meeting

THE AMERICAN RED CROSS

Membership in the Red Cross offers the way to help those who have become victims of natural disasters such as floods, fires, earthquakes, etc Each year the Red Cross answers nearly one hundred such calls for aid There are bureaus of 3700 chapters and 9000 branches located in the states and the service is given from these central points

TRI-STATE PHARMACEUTICAL CONVENTION

The Tri State Convention of Idaho, Washington and Oregon, at the same time and place, with that of the AMERICAN PHARMACEUTICAL ASSOCIATION, was eminently successful The work of F C Felter was given much credit for carrying the program into effect

DRUG LAW REVISION POSTPONED TO 1936

There will be no action on the food and drug bill until Congress reconvenes in January it was declared by Representative Virgil Chapman of Kentucky, *Chairman* of the subcommittee of the House Interstate Commerce Committee which conducted hearings on the measure

OBITUARY

P E HOMMELL

Dr Philemon E Hommell Jersey City, N J, member of the AMERICAN PHARMACEUTICAL ASSOCIATION, one of the founders and first dean of the New Jersey College of Pharmacy Newark died August 21st, aged 72 years He was graduated by the New York College of Pharmacy and the Bellevue College Medical Hospital and maintained a private medical practice in addition to his college post Dr Hommell served for many years as professor of materia medica and toxicology at the New Jersey college and at the time of his death was *dean emeritus* of the institution He was a former president of the New Jersey Pharmaceutical Association and was a delegate to the United States Pharmacopœial Convention, 1900-1920

HENRI GOLAZ

Dr Henri Golaz professor of Galemcal Pharmacy, Lausanne University, and chief pharmacist, County Hospital Lausanne, died June 30th, aged 75 years He was educated at Vevay, and on completion of his studies he went into business in Sainte Croix, returning to Vevay after several years to take over the Pharmacie des Crois Couronnes, the oldest pharmacy in the district In 1925 he was awarded the degree of Sc D *honoris causa* by Lausanne University, he was among those who received the members from the different countries on the occasion of the 1924 International Pharmacy Congress held in Lausanne

He was chairman of the Committee for the Unification and Standardization of Preparations of Poisonous Drugs, and member of the Revision Committee of the Swiss Pharmacopœia

DR HERMANN EMDE

Dr Gottfried Wanruk, Koenigsberg, Pr, Besselstrasse 5, Germany, advises that Doctor of Philosophy, Hermann Emde, director of the Pharmaceutic Chemical Institute of the Albertus University, Koenigsberg, Pr Besselstrasse 5, Germany, died in Thun, Switzerland, on a visit for the restoration of his health, following an operation The deceased was Professor of Pharmaceutical and Food Chemistry

ARTHUR DEHON LITTLE

Arthur Dehon Little, aged 71 years, chairman of the board and founder of Arthur D Little, Inc, a *past-president* of the American Chemical Society, and a member of the Advisory Board of Industrial and Engineering Chemistry died suddenly August 1, 1935, at the Rock End Hotel Northeast Harbor, Maine, where he had gone to spend the summer with Mrs Little Upon arrival at the hotel on July 28th, Dr Little seemed completely exhausted as the result of a cold The following day pneumonia developed Dr Little was born in Boston, Mass, on December 15, 1863 He was a member of the class of 1885 of Massachusetts Institute of Technology

(Continued on page 732)

WEST VIRGINIA STATE PHARMACEUTICAL ASSOCIATION

R. L. Swain was among the speakers at the West Virginia Pharmaceutical Association on the present conditions of the druggists and the problems which face them in the future. He explained the Fair Trade Bill as passed by the Maryland Legislature and the steps which have been taken in other states to put the measure into operation.

The following were nominated for officers, election to be held by mail ballot, for 1936-1937: *President*, Rodney A. Barb, Parsons, E. O. Wiseman, Fayetteville, *First Vice-President*, James A. Patterson, Martinsburg, Paul Poundstone, Buckhannon, *Second Vice-President*, J. Edgar Johnson, Charleston, W. S. Coleman, Lewisburg, *Third Vice-President*, Fred A. McFarlin, Clarksburg, Charles E. Tuttle, Parkersburg, *Secretary-Treasurer*, J. Lester Hayman, Morgantown, Roy B. Cook, Charleston, *Member of Council*, J. Charles Hall, Charleston, Fred C. Allen, Marlinton.

The fifth annual veterans' luncheon with an excess of fifty veterans in attendance was a feature of the Convention. Several of the charter members were present.

W. Bruce Philip, secretary of the District of Columbia Pharmaceutical Association, was a feature speaker, stressing the necessity of co-operation and pointing out the value of belonging to the state and national pharmaceutical associations.

The following officers were installed to serve during the year: *President*, Robert R. Pierce, Morgantown, *First Vice-President*, John A. Greear, Huntington, *Second Vice-President*, Jas. A. Patterson, Martinsburg, *Third Vice-President*, H. A. Goodykoontz, Bluefield, *Secretary-Treasurer*, J. Lester Hayman, Morgantown, *Member of Council*, Chas. V. Selby, Clarksburg.

CANADIAN PHARMACEUTICAL ASSOCIATION

The education of the apprentice, dealt with by Professor A. W. Matthews of the School of Pharmacy, University of Alberta, Edmonton, drew a good deal of cross fire and debate at the Canadian Pharmaceutical Association. Out of this it is believed there will be some plan evolved in every province of the Dominion to take the education of the apprentice out of the

hit and miss" class and give it some definite trend.

The newly elected officers of Canadian Pharmaceutical Association are: *Honorary Presidents*, Miss Agnes Short, Saint John N. B., H. S. Tapscott, Brantford, Ont., E. A. Jolly, Regina, Sask., J. H. Best, North Battleford, Sask., J. F. Scott, Cranbrook, B. C., Rod. Dagenais, Montreal, Que., *President*, S. R. Balcom, Halifax, N. S., *Vice-President*, H. M. Corbett, Creemore, Ont.

At a meeting of the Council A. J. Wilkinson was elected *Chairman*, Dr. B. J. Stanbury, *Secretary-Treasurer*, both are reflections. The 1936 meeting of the Canadian Pharmaceutical Association will be held at Saskatoon.

NEW NRA BODY TO SURVEY FAIR TRADE ACTIVITY

Under supervision of Mark Merrell, formerly assistant deputy administrator in charge of the retail drug and other distribution codes for the old NRA, a newly created Loss Limitation unit of the NRA has started a comprehensive study of retail price control and of loss leader merchandising.

Work on the price control study must be completed before next April when the new NRA expires, every effort is to be made to have it business-like and thorough. At present a staff of fourteen persons is engaged in the study, including statistical and legal experts formerly engaged in other NRA work.

THE PATMAN BILL

Shortness of time has stopped any action by the House Judiciary Committee on the Patman bill or some substitute for it. Although hearings were concluded, members of the committee did not have time to act on the complicated problems involved in an attempt to eliminate price discrimination. Chairman Hatton W. Sumners has appointed a subcommittee to study the bill and others of a similar nature and to make a report during the next Congress to the full committee.

PAREGORIC RULING

The Food and Drug administration has ruled that paregoric labels must bear a warning that it is a dangerous preparation particularly for children.

FAIR TRADE LEGISLATION

Secretary Robert L Swann, of Baltimore, of the Maryland Board of Pharmacy, will head the committee on federal and state fair trade legislation of the National Association of Retail Druggists. The committee will endeavor to assist states in securing passage of fair trade legislation, and will support efforts toward the enactment of a national fair trade law.

In addition to Chairman Swann the committee includes N S Gesoalde, New York, Robert P Fischelis, New Jersey, J B Pilchard, Pennsylvania, Otto A Bjornstad, Iowa, Bernard S Weinshenker, Illinois, John F Huber, Wisconsin, Roy A Perry, Oregon, M P Goodner, Washington, and E F Kelly, Washington, D C.

ILLINOIS

Under a law passed by the Illinois Legislature, druggists, both retail and wholesale, are compelled to grant employees at least twenty-four consecutive hours of rest in addition to the regular period of rest at the close of each working day. Although, generally speaking, the majority of drug stores without the compulsion of law grant employees definite periods of layoff, there are believed to be a small number where, on occasion, employment has been of seven days' duration.

KENTUCKY BOARD

Failing to work out the budget situation which was brought about when Gov Ruby Laffoon vetoed a \$6500.00 appropriation, the Kentucky Board of Pharmacy has indicated that it probably will take its case to court in a friendly suit to determine its financial status.

MARYLAND REPEAL FAILS

Baltimore druggists, who joined with other retailers in an effort to have the gross receipt tax declared unconstitutional, met defeat when the Maryland Court of Appeals sustained the law's constitutionality.

PROCEEDINGS N A B P DISTRICT NO 2, BOARDS AND COLLEGES OF PHARMACY

The proceedings of the N A B P, District No 2, Boards and Colleges of Pharmacy, has been issued in a mimeographed form of 118 pages. The meeting was held March 11-12 1935.

THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

The following officers for 1935-1936 were elected by the American Association of Colleges of Pharmacy: *President*, Robert C Wilson, Athens, Ga., *Vice President*, H C Washburn, Boulder, Colo., *Secretary-Treasurer*, Zada M Cooper, Iowa City, Iowa, *Chairman of the Executive Committee*, C B Jordan, La Fayette, Ind., *Members of the Executive Committee*, Ernest Little, Newark, N J., Rufus A Lyman, Lincoln, Nebr. *Member of the Syllabus Committee*, H A Langenhahn, Seattle, Wash.

Officers of the Teachers Conferences are as follows: *Pharmacy*, *Chairman*, E T Motley, S Car., *Vice Chairman*, Robert C Wilson, Athens, Ga., *Secretary*, C O Lee, La Fayette, Ind. *Chemistry*, *Chairman*, Arthur H Uhl, Madison, Wis., *Secretary*, Lewis C Britt, Corvallis, Ore. *Pharmacognosy and Pharmacology*, *Chairman*, Charles E Mollett, Missoula, Mont., *Secretary*, R D Bienfang, Norman, Okla. *Pharmaceutical Economics*, *Chairman*, John F McCloskey, New Orleans, La., *Secretary*, W Henry Rivard, Providence, R I.

National Association Boards of Pharmacy — *President*, W Mac Childs, Eldorado, Kansas, *Honorary President*, F H King, Delphos, Ohio, *Vice-Presidents*, George A Moulton, New Hampshire, John M Woodside, Pennsylvania, John Clemmer, Florida, Earl E Durham, Michigan, R C Schultz, Wyoming, John F Allen, Oregon, *Secretary*, H C Christensen, 130 N Wells St., Chicago, Ill., *Treasurer*, J W Gayle, Frankfort, Ky.

Conference Pharmaceutical Association Secretaries — *President*, J W Slocum, Indianola, Io., *First Vice-President*, Roy S Warnack, Los Angeles, Calif., *Second Vice-President*, Wm B Day, Chicago, Ill., *Secretary-Treasurer*, Carl G A Harring, 20 Glen Road, Newton Center, Mass., *Members of the Executive Committee*, F V McCullough, New Albany, Ind., R C Wilson, Athens, Ga., J Lester Hayman, Morgantown, W Va., Dennis E Murphy, Cincinnati, Ohio.

National Conference on Pharmaceutical Research — *Chairman*, E N Gathercoal, *Vice Chairman*, Wm J Husa, *Secretary*, John C Krantz, Jr., *Treasurer*, Fitzgerald Dunning, *Members of Executive Committee*, H V Army, Francis E Bibbins and Glenn L Jenkins.

THE NATIONAL ASSOCIATION OF RETAIL DRUGGISTS MEETS IN CINCINNATI, SEPTEMBER 23rd-27th

THE DRUG TRADES EXPOSITION

The Drug Trades Exposition will open its annual exposition October 15th, at the Grand Central Palace, New York City

PHARMACY WEEK WINDOW DISPLAYS

Chairman Anton Hogstad Jr, suggests that it will be found preferable to select one title for a display and build the entire exhibit around this. In a circular issued fifty titles are given for displays and these have been selected as a means of interesting the public and advancing the cause of pharmacy

THE NATIONAL ASSOCIATION OF INSECTICIDE AND DISINFECTANT MANUFACTURERS

At the annual convention of the National Association of Insecticide and Disinfectant Manufacturers in Chicago, a committee was appointed to take action on setting standards for household insecticides in an educational campaign

CHAPTER KAPPA PSI

The organization of a new graduate chapter of Kappa Psi, national pharmaceutical fraternity, by a group of University of Pittsburgh graduates, was announced at the Pennsylvania Pharmaceutical Association Convention. The following are officers and charter members

C E Rickard of Dormont, Pa, *Regent*, W J Hill, of Pittsburgh, Pa *Vice Regent*, E Reeves of Avalon, Pa *Secretary*, H A Krumpke, of Gibsonia, Pa, *Treasurer*, J W Wible, of Apollo, Pa, *Chaplain*, F J Steele, of Pittsburgh Pa *Historian*, C Schaefer of Pittsburgh, Pa, *Chairman of the By Laws Committee*, Dr L K Darbaker, of Wilkensburg Pa R Taylor, of Greensburg Pa, E Claus, of Pittsburgh, Pa, G Young, of McKeesport, Pa W Siegel, of Erie, Pa, R Miller of Pittsburgh, Pa

The officers and the charter members constitute the committee on By-Laws

PHARMACEUTICAL STANDARDS

The 1935 revised edition of the Manual of Pharmaceutical Standards including Tolerances and Methods of Analysis is ready for

distribution. This compilation, prepared by the Combined Pharmaceutical Contact Committee of the American Drug Manufacturers' Association and the American Pharmaceutical Manufacturers Association, with the cooperation of the Food and Drug Administration, U S Department of Agriculture consists of 17 monographs on Ampuls, 36 monographs on Compressed Tablets and 18 monographs on Hypodermic Tablets. The price of the manual is \$3.00. Copies may be obtained from the American Drug Manufacturers' Association 506 Albee Building, Washington D C, or from the American Pharmaceutical Manufacturers Association 246 High St, Newark N J

(Continued from page 729)

THOMAS H POTTS

Thomas H Potts, former secretary of the National Association of Retail druggists and later a field representative of the organization died August 12th. Mr Potts served the N A R D as secretary for a number of years, terminating this position in 1916. Illness incapacitated him and for several years he has been in poor health.

DR BENJAMIN LINCOLN ROBINSON

Dr Benjamin Lincoln Robinson, former curator of the Gray Herbarium at Harvard University and Asa Gray Professor Emeritus of Systematic Botany at the university died July 27th, at his Summer home in Jaffrey, N H. He was seventy years old. Prof Robinson who had served on the Harvard faculty for forty five years, was an authority on the flora of the United States, Mexico, tropical America and the Galapagos Islands. He was born in Bloomington, Ill, was graduated from Harvard in 1887 and received a Ph D degree from University of Strasbourg two years later.

Prof Lydia Rabinowitsch-Kempner, famous bacteriologist and associate of Robinson Koch in many of his most important investigations, died in Berlin, August 3rd. She was sixty four years old. She was graduated from the Universities of Zurich and Berne, and after taking her doctor's degree, joined the Institute for Infectious Diseases at Berlin, where, under the direction of Dr Koch, discoverer of the tubercle bacillus she was engaged in researches on the influence of heat on bacteria and pathogenic yeast specimens.

HARVEY A HENRY

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL XXIV

SEPTEMBER, 1935

No 9

HARVEY A HENRY

Harvey Abner Henry, president of the National Association of Retail Druggists, 1934-1935, was born in Lebanon, Pa., February 16, 1884. He received his early education in the schools of Lebanon and, thereafter, was apprenticed to Joseph L. Lemberger, a former president of the AMERICAN PHARMACEUTICAL ASSOCIATION (1905-1906).

Mr. Henry matriculated at the Philadelphia College of Pharmacy and Science and was graduated with the degree of Doctor in Pharmacy, in 1906. After graduation he returned to the pharmacy of Joseph L. Lemberger and remained with his preceptor until 1913, when he removed to California where he has since then made his home in Los Angeles. In 1919, he opened a review course in Pharmacy to assist candidates in preparing for their State Board examinations.

In 1921, he formed a partnership with Glenn F. Coleman under the firm name of Henry & Coleman; they operate two pharmacies at present in the W. P. Story Building and an upstairs Prescription Pharmacy, and another in the Professional Building, at 6th and St. Paul streets—a corner professional pharmacy.

In 1929, Mr. Henry was elected president of the Southern California Pharmaceutical Association and, in 1933, the California Pharmaceutical Association honored him with the presidency. His advancement by the National Association of Retail Druggists began in 1932, by election as third vice-president and the following year as second vice-president. In 1934, Mr. Henry was elected chairman of the Executive Committee of the N. A. R. D., in the following year he was elected president of that organization and he presides this month at the Cincinnati meeting.

Mr. Henry is vice-president of Los Angeles Wholesale Drug Company.

MEMBERSHIP

DR ERNEST LITTLE points the way to another great cooperative effort which can be executed by the present members of the AMERICAN PHARMACEUTICAL ASSOCIATION. The need for this organization is well established. The importance of an aroused, active and representative membership is too well recognized to dwell upon it. To bring about the realization of this and improve our position Dr Little places the responsibility, or divides it, equally and rightly, and says, "Let's see what we can do." His plan furnishes each member an opportunity to do his full share by securing at least one new member. This should not be difficult to do. It is the way to a greater and more useful AMERICAN PHARMACEUTICAL ASSOCIATION. I hope each member will do his share and do it promptly.
—P H COSTELLO, *President*

LET'S SEE WHAT WE CAN DO

Some 400 members have just returned from the Eighty-Third Annual Meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION which was held in Portland, Oregon, from August 5th to 10th.

These members have returned home with greatly varying impressions of the importance of what transpired at this convention and I trust with many and varied ideas as to what can be done to further increase the usefulness of our ASSOCIATION to pharmacy, how to set about performing this very important service.

The report of one of our officers called attention to the fact that at the present time our ASSOCIATION is made up of but about 3000 members.

It is discouraging and somewhat surprising to learn that less than 3% of the 132,000 registered pharmacists in the United States are direct members of the AMERICAN PHARMACEUTICAL ASSOCIATION. I recognize that all state association members are affiliated members of the A P H A.

I would feel that I have done nothing of a constructive nature if I did no more than call to your attention the fact that our membership is exceedingly small. The important questions involved are "Why are so few of our registered pharmacists members of the AMERICAN PHARMACEUTICAL ASSOCIATION?" and "What can be done to improve existing conditions?"

We are all in agreement, I am sure, as to the need and absolute necessity of a strong parent organization to head up and direct all pharmaceutical activities, to constantly increase and improve the service which pharmacy is offering, and to increase the effectiveness and well-being of its practitioners. The small membership of the AMERICAN PHARMACEUTICAL ASSOCIATION is not due to the fact that there is no need for an organization of its scope and purposes.

It is not due to lack of talent and ability within the organization. At the Portland meeting our members had the privilege of listening to more than 300 scientific papers, committee and officers' reports, before the various divisions of the AMERICAN PHARMACEUTICAL ASSOCIATION and its related organizations. As

a group, these reports were of high quality They indicated, very definitely, that we are possessed of our full share of talent and ability and that these talents are being successfully and effectively applied in a variety of ways and in many directions The necessary talent is within our ranks

I believe also that you will agree that the deplorably small membership in our ASSOCIATION is not due to lack of interest or effective endeavor on the part of our ASSOCIATION officers, the most important of whom is the secretary It requires but one visit to our secretary's office to impress upon you his many and varied activities in behalf of pharmacy and the conscientious and efficient manner in which he is devoting himself to ASSOCIATION affairs

The difficulty, as I see it, rests with the individual members of our ASSOCIATION, with you and with me I know that such a statement is never a popular one I know it may be resented by some individuals My desire, however, is to prove helpful rather than complimentary

Well do I remember the determined drive Dr Robert L Swain made during his term of office as president of the AMERICAN PHARMACEUTICAL ASSOCIATION to increase our membership The fact that the results were disappointing is not to Dr Swain's discredit He pointed the way and organized the drive In this detail his experience was the same as any other efficient leader would have encountered under such circumstances Without the active support and cooperation of the individual members even the most effective and dynamic leader can accomplish but little

My challenge is, let us stop shifting responsibilities to the shoulders of others—"Let's See What We Can Do"

There are few, if any, members of our ASSOCIATION who could not, with a minimum amount of effort on their part, secure at least one new member before the next annual meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION It is possible that there are some members of our ASSOCIATION who are so situated that they could not induce even one pharmacist to join our ranks This condition is more than offset by the fact that many of our members could, with a reasonable amount of effort, secure a dozen new members during the current year What fine cooperation we would be showing President Costello if we, without any effort on his part, doubled the membership of the AMERICAN PHARMACEUTICAL ASSOCIATION during his administration, thus leaving him free to devote his time to problems of administration and organization It can be done Are *we* interested enough to do it?

I am to-day sending the following note

Dr E F Kelly Secretary,
AMERICAN PHARMACEUTICAL ASSOCIATION,
Washington, D C

Dear Dr Kelly

I shall endeavor and persistently strive to bring not less than six new members into the A P H A before the 1936 annual meeting You may consider me definitely obligated to the above responsibility

Yours for Pharmacy,
ERNEST LITTLE

The membership year is the calendar year. Under the By-Laws membership taken between June and January may also cover the succeeding calendar year. It is, therefore, advantageous to join at this time. The Report of the Progress of Pharmacy including the Pharmaceutical Abstracts heretofore appearing in the YEAR BOOK, is now printed monthly in the JOURNAL, bringing this helpful review of the literature of pharmacy to the members each month. The JOURNAL is included in the dues.

I recommend and urge that all Sections of the A. P. H. A. adopt as one of their major projects for the year, the doubling of their membership by August 1, 1936, and that the undertaking be initiated by securing from each member of their section the promise that he will faithfully strive to obtain at least one new member for the A. P. H. A. as his contribution to this most worthy project.

I recommend that the various Branches urge their members to send to Secretary Kelly a letter similar to, if not identical with, the one given above, substituting any number which they may desire for the word "six," found in the first sentence of the letter.

I recommend also that during this "membership year" the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION publish in a prominent place the names of our new members and the name of the member responsible for each new membership. It might be advisable also to publish each month an "Honor Roll," containing the names of the ten members of our ASSOCIATION who have secured the greatest number of new members and the record of each to date.

To further stimulate this effort for membership, I am glad to announce that the Northern New Jersey Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION will be pleased to present a pennant, each year for the next two years, to the Branch showing the highest percentage gain in membership during the year. This pennant might appear somewhat as follows:

I suggest that this pennant be prominently displayed at the annual convention and all the general meetings of the A. P. H. A. and that it then becomes the permanent possession of the successful Branch, which Branch shall have the privilege of having the pennant on display in the Headquarters Building in Washington, D. C., during the remainder of the year if desired.

I feel that two, or possibly three such pennants should be awarded each year to Classes A, B and C, depending upon the size of the Branches. Such a classification might make an award, based upon percentage of increase in membership more equitable. I would suggest also that no Branch be allowed to be the donor

of a pennant for more than two consecutive years, providing another Branch desires such privilege. Other necessary details can easily be worked out.

It is possible that there is but little of merit in the above suggestions. If such be the case, this article may still serve a useful purpose, provided it stimulates action on the part of our members and prompts some one to submit a better plan which can be put into immediate operation.

It is time to stop merely bewailing our small membership and weakly pointing the finger of responsibility at our national officers. Let us place the responsibility where it rightfully belongs—on the shoulders of the individual members and then "Let's See What *We* Can Do." What do you think? May we have your comments and suggestions?

THE EDUCATIONAL VALUE TO BE DERIVED FROM THE TRAVEL TO THE CONVENTIONS OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

ASIDE from the beauties of the section in which the Portland meeting was held, and its unsurpassed scenery, those who were privileged to attend were brought in contact with the history of the Northwest United States made known and resourceful by the Lewis and Clark Expedition.

In this issue of the JOURNAL a paper on the "Badianus Manuscript" is published—the original is in the Vatican Library and is believed to be the earliest herbal produced on this side of the Atlantic. Dr. Emily Walcott, of Johns Hopkins, Baltimore, is the author of a monograph concerning the Manuscript, an Aztec herbal, composed in the year 1552 in the famous College of Santa Cruz at Tlaltecloco, Mexico City.

The contribution is of interest because it deals with research in Mexico of about the time when the resources of this part of the New World were brought to the attention of Charles V, during whose reign the Spaniards conquered Mexico. In 1936 the AMERICAN PHARMACEUTICAL ASSOCIATION will hold its annual meeting in a section of the United States, celebrating the centennial of its independence from Mexico, a neighbor Republic with which cordial relations exist.

The meeting next year will make the members acquainted with the varied resources of the Southwest, developed by pioneers whose names reflected credit and honor, predominant among them—General Sam Houston with a splendid record as a member of Congress from Tennessee, Governor of that State, President of Texas, its Senator and its Governor. A man whose outstanding characteristics were honesty and loyalty, interested in the development of resources, in the establishment of educational institutions, he was one of the founders of Baylor University. Here lived for a time "O. Henry," a druggist in his earlier years. The Pharmacy School of the University of Texas is well equipped and its home is in one of the larger buildings on the Campus at Austin.

Several missions of the Franciscans—who in the earlier years cared for the sick and dispensed medicines—are still in a good state of preservation in San Antonio.

Mexico is launching an educational experiment in San Antonio—a library is to be established, partly supported by the Mexican Department of Education which will supply books and a librarian. It is hoped to expand the library into a cultural

center for Mexicans and furnish them with the means to enjoy their language literature

Every meeting brings opportunities for further acquaintance with our history, resources and contributions of the section to the wealth and health of our people

THE PRESCRIPTION DEPARTMENT

MUCH has been said and written about the "Open Prescription Department" Included in an article of a recent issue of the *Pharmaceutical Journal of New Zealand* is a reference to the pharmacy of the late John F Hancock, Baltimore, a former president of the AMERICAN PHARMACEUTICAL ASSOCIATION A picture of the interior is shown—the pharmacy is now owned by W F Thiede

The following, from reminiscences of the former (*about 1866*), will be of interest, communicated in a letter received from James E Hancock, son of the above named

The store was newly furnished in walnut with side glass cases and, back of the arch way the rear room was fitted up for prescription work with a central semi-circle of shelves for small bottles containing duplications from the large shop bottles in the front room The plans were carefully considered with a view to convenience economy of space and safety to the dispenser The prescription counter was placed in full view of those in the front room, but sufficiently retired to avoid conversation while prescriptions were being compounded "

It may be of further interest that Mr Thiede, the present owner, was asked why he had not remodeled the pharmacy and his reply was—"that the pharmacy was up-to-date "

Those who desire to read the article¹ referred to will find much of interest and value, the article is illustrated by drawings, drawn to scale A purpose of this comment is to present the ideas, on a subject of present-day interest, of a pharmacist who devotedly served his profession and was a faithful member of the ASSOCIATION for more than sixty years

IT IS DOING, AS WELL AS THE AIMS AND PURPOSES

IT IS ALL very well to contend that pharmacists should practice pharmacy—all will agree to that—but the conditions are with us that limit the opportunities This fact should impress the thought to shape the status so that a greater number can put their aims and purposes into practice

There are some, perhaps many, who prefer to conduct what is known as the modern drug store, but can pharmacy attain to a higher professional standard thereby? There will be rightful differences of opinion Many papers are written which seek to build on the foundation of existing conditions, but it is necessary to shape them with the end in view to remove the obstacles that hinder advancement, adherence to the code of ethics is an essential

The schools of pharmacy had their inception, not by replacing the drug stores, but by giving those in the practice of pharmacy an opportunity for a deeper knowledge of its activities and derive a living income therefrom

The AMERICAN PHARMACEUTICAL ASSOCIATION had its beginning, because the founders realized that inferior materia medica and lack of uniformity in prepara-

¹ PROCEEDINGS A PH A 1872 pages 192-200

tions interfered with rendering the right kind of service to the public and added directly or indirectly to the cost of production, the results of the efforts were better service, greater uniformity and an improved materia medica, and should have resulted in restricting the dispensing of medicines and sale of medicinal products to druggists. But as the latter recognized in the sale of side-lines, many of them foreign to their business or profession, an opportunity for increasing sales volume, so merchants ventured into merchandising medicines and products that properly belong to the drug stock. No exception is taken for the inclusion of side-lines nor is this intended for a discussion of the rights of merchants, for which the public is largely responsible.

Volume increase and profit are closely related, hence the step to competition, fair and unfair, by those who should seek, as far as is right, to cooperate. These practices have entered all lines and resulted in unfair means, which for the good of all should be corrected, for the nation and state are dependent on the relative prosperity of all classes and individuals.

An effort has been made in a very brief way by this comment to outline the developments which have brought about a more or less unsatisfactory status by removing from our business life a most valuable class of citizens, or at least reduced their number by bringing about unsatisfactory trade conditions.

Steps have been taken to correct unfair practices by states, but the federal government should join in the effort, for the prosperity of the nation depends upon that of the individuals engaged in whatever pursuit—success depends on proper relationship.

A STUDY OF THE ASSAY OF ACONITE AND THE STABILITY OF ITS PREPARATIONS

Investigators of the stabilization of Aconite preparations have reported that increased acidity of the preparation promotes stability. The statement has been checked in this paper and has been found to be correct. A chemical assay procedure for determining the amount of aconitine present in Aconite preparations has been worked out based on the dissociation constants of the alkaloids involved. The assay procedure is of such nature that by use of certain values obtained in the assay procedure, aconitine may be calculated in milligrams from an equation the derivation of which is given in full—George L. Baker and C. B. Jordan in a paper read before Scientific Section A. Ph. A., Portland meeting, 1935.

APOTHECARY SHOPS OF COLONIAL TIMES

A compilation of scattered historical data published in pharmaceutical literature and other sources of the past few years and describing apothecary shops, proprietors and distinguished customers of colonial days. The oldest American apothecary shop still in existence and doing business is the Rau Pharmacy in Bethlehem, Pa. The oldest record of an apothecary shop in America (1646) is that of Wm. Davies of Boston, Mass. This was probably the first store devoted exclusively to Pharmacy in America—Abstract of a paper presented by Millicent R. LaWall at the Portland A. Ph. A. meeting.

A STUDY OF THE U S P THYROID ASSAY *¹

BY GEO D BEAL² AND CHESTER R SZALKOWSKI³

AUTHORS NOTE This paper is a drastic condensation of a lengthy report submitted to the United States Pharmacopœial Committee of Revision and presents only the authors' conclusions. JOURNAL limitations have made it necessary to omit all detail and the comprehensive tables. The senior author will be glad to furnish such details to any interested person.

During the past year an unusual amount of criticism of the U S P X Thyroid assay has been heard, due primarily to a difference of interpretation of method in a case in Federal Court. This led to a brief but critical study of the procedure, covering a period of three months. Sixteen samples of desiccated thyroid or compressed tablets thereof were furnished by producers, who also favored us with criticisms and suggestions regarding the U S P X method. In view of the limited time available, no thought was given to the determination of thyroxine content, but our attention was limited to the determination of the iodine content. Also, in view of the fact that the U S P method was approved in principle by the manufacturer's chemists who dealt most extensively with this drug, no attempt was made to devise a new procedure. We, on the contrary, directed all of our energies to the searching out of sources of error in the method, and the amplification of the directions in order that the pitfalls therein might be avoided.

Practically all of the methods proposed for this assay have been based upon the original work of Baumann (1). Such an assay consists of three stages:

- 1 Fusion with alkali, destroying the organic matter and binding the iodine as an iodide
- 2 Oxidation of the iodide to iodate
- 3 Iodometric determination of the iodate

The Fusion Mixture—Baumann destroyed organic matter by fusion with sodium hydroxide and nitrate. Kendall (2) used both a solution of and solid potassium hydroxide with potassium nitrate. Kelly and Husband (3) used a modification of Kendall's procedure, while Grutzner (4) used a mixture of sodium hydroxide and peroxide. Kraus (5) and Hunter (6) used a mixture of sodium and potassium carbonates and potassium nitrate for the fusion, while Volhard (7), Hofmeister (8), Neuman and Meinertz (9), Oswald (10) and Middleton (11) have studied the different alkalies and their use in organic fusions. Harden (12) proposed the use of the Eschka fusion mixture of sodium carbonate and magnesium oxide as used for the determination of sulphur in coal, in which atmospheric oxygen serves as the oxidizing ingredient.

* Scientific Section A PH A Portland meeting 1935

¹ Contribution from the Mellon Institute of Industrial Research, Pittsburgh, Pa. Published by permission of the Chairman, Committee of Revision, United States Pharmacopœia. Assistant Director, Mellon Institute.

³ Formerly Assistant, Department of Research in Pure Chemistry, Mellon Institute.

U S P X adopted Hunter's mixture, consisting of 138 parts by weight of anhydrous potassium carbonate, 106 parts of anhydrous sodium carbonate and 75 parts of potassium nitrate. This mixture forms during fusion the eutectic corresponding to potassium sodium carbonate, the fusion point of which is lower than either of its components, and does not have the tendency to creep and spatter that occurs when a caustic fusion mixture is used.

Fusion without an active oxidizing agent may produce apparently complete decomposition, but the sulphur of the tissue protein is not completely oxidized, so that the resulting solution either liberates hydrogen sulphide or precipitates sulphur on further treatment.

Temperature and Time of Fusion —The first defect in the U S P X direction is "Heat the crucible over a free Bunsen flame until no further carbonization is observed." Some analysts obeying this may use a strong and rapid heating while others may start with a very low flame and gradually increase the heat to the point of fusion. Results may vary because of this. Hunter recommended rapid fusion because it is safe as well as convenient. He did not observe any loss of iodine when heating thus, but found in controls that when heating was spread, by gradual increments, over one and one-half hours, results were considerably too low. Oswald also believed that rapid oxidation is least likely to cause a loss of iodine.

We find that either too rapid or too slow heating gives results that depart from the truth. Too rapid combustion causes loss of iodine by volatilization, as does a lower but much slower combustion. In our experience, the proper heat will bring the crucible and mass to a dull red in ten minutes, while holding this temperature for an additional ten minutes will yield a white fusion mass, the edges of which will have just begun to melt. No free carbon will be present, so that the solution will not require filtration, and no incompletely oxidized sulphur will be left. The mass, not having fused in its entirety, is friable and easily brought into solution in hot water.

Other advantages of the carbonate-nitrate fusion are apparent here. Carbon always remains after the caustic fusion unless a very large excess of nitrate is used. The Eschka mixture does not form a clear solution until it is acidified. The Eschka mixture also produces decided intumescence during heating.

Oxidation of Iodide to Iodate —This may be accomplished with such oxidizing agents as bromine, chlorine water, solutions of hypochlorites, and potassium permanganate. Of the halogen-oxidizing agents, bromine is perhaps more widely used, although it has many disadvantages, such as

- (a) It invariably contains iodine, and only painstaking washing with water will remove this.
- (b) Some of the nitrate forms nitrite during fusion and this in turn reduces bromine to bromide, which may interfere during the later treatment.
- (c) Excess bromine is removed by boiling with only great difficulty. Therefore an agent such as phenol or salicylic acid must be added to precipitate the bromine.

No one of our experiments involving the use of bromine was as successful as the U S P procedure. We are confident that the use of this oxidizing agent requires much more attention than does that of sodium hypochlorite.

Potassium permanganate is used in the U S P thyroxine assay, which is al-

most a micro-determination. An excess of permanganate must always be removed by another agent. Manganese under some conditions may catalyze the atmospheric oxidation of iodine solutions, and has been known to react with iodates.

Chlorine water and solutions of hypochlorites have one disadvantage, they may contain chlorates. Chlorine water is seldom used for the oxidation of iodide to iodate. Sodium hypochlorite, on the other hand, has two distinct advantages, *first*, it oxidizes iodide to iodate in alkaline solution, *second*, it supplies an excess of chlorine which prevents the loss of iodine upon acidification.

The use of sodium hypochlorite introduces considerable quantities of chloride. Later hydrochloric acid is liberated. Iodic acid may react with hydrochloric acid as follows

This not only requires a large excess of hydrochloric acid but the concentration must be quite high. Such a condition is practically impossible to attain in this assay. Even on addition of sodium chloride no measurable loss of iodine occurred.

The formation of chlorates in hypochlorite solutions depends upon the temperature. We have found that if the temperature of the solution obtained from the fusion exceeded 30°C , our results were higher than when the temperature at addition of the hypochlorite was $15\text{--}20^\circ \text{C}$. This is quite likely due to the formation of chlorate in the hypochlorite solution.

By means of Wilson's (13) method for the determination of hypochlorites by direct titration with sodium thiosulphate in the presence of acetic acid, a method in which chlorates remain unaffected, we have found that the rate of change from hypochlorite to chlorate is somewhat slower in a solution prepared from bleaching powder and sodium carbonate than in one prepared from sodium hydroxide and chlorine. Thus, we believe, contributes to the sharper end-point in the final titration, for the chlorate may perhaps oxidize iodide at that time. Such an error is minimized if a blank determination is carried through, but it is our opinion that even high blanks should be avoided.

We would say that the greatest differences of opinion among authors have to do with such essential factors as the acidity of the solution, the nature of the oxidizing agent, and the method of removing the excess. Kendall and Kelly (*loc cit*) are at absolute variance on the question of acidity if bromine be used as oxidizing agent, Kendall claiming that the p_{H} during bromine removal is of greatest importance, Kelly that it is a matter of little moment. We think that when the U S P procedure of oxidizing with hypochlorite is followed, the degree of acidity during the removal of excess chlorine is of considerable importance, although perhaps not so much so as the duration of or volume during boiling.

U S P X directs

"Treat the mixture with enough phosphoric acid, diluted with an equal volume of distilled water, to produce an appreciable yellow tint of free chlorine, add about 10 cc more of phosphoric acid, diluted with an equal volume of distilled water etc."

Such a procedure is very uncertain since this so-called yellow tint is not easily distinguished as a change from the slight tint of the hypochlorite solution. Guided by tint alone, we have been quite unsuccessful in gaging the acidity of our solution.

On the other hand, too large an excess of acid may cause the liberation of iodine from the iodate on boiling or it may interfere with the proper starch-iodine end-point. The acidity should be controlled by maintaining reasonable precision in the quantities of fusion mixture and of hypochlorite solution used. If one takes altogether 20 Gm of fusion mixture, as directed, and 50 cc of freshly prepared chlorinated soda T S, 60 cc of dilute phosphoric acid, prepared by diluting U S P acid with an equal volume of water, is ample.

U S P X then directs "Boil for half an hour or until the volume has been reduced to 150 cc." Hunter observed that after boiling for ten minutes the vapor gave no blue color with starch-iodide test paper, and from this point he heated for fifteen minutes longer. We have evaporated such solutions until the volume was below 150 cc, in some cases losing iodine and in others finding chlorine still in the solution. We believe that the volume before evaporation should be at least 300 cc and at the end not less than 150 cc, preferably 175 cc. The time of boiling ought to be not less than one and one-half hours, although no blue color is observed with starch-iodide paper held in the neck of the flask after one hour's boiling. To insure complete removal of chlorine, the solution ought to be boiled for at least one-half hour after no blue color is obtained.

Titration of the Iodine—Obviously the potassium iodide solution added to reduce the iodate must itself be free from iodate. Too little attention, however, is often paid to the starch T S. According to U S P X, the amount might be regarded as unlimited. Too great an excess will give a reddish color to the solution that will persist after the blue has been discharged. Hence, just enough should be added to give a sharp end-point, and in our experience 3 cc is ample, to be added just before the conclusion of the titration. Furthermore, starch T S prepared from pure arrowroot starch is the most sensitive and gives the sharpest end-point. This has been established by series of comparative titrations in which also potato, corn and soluble starches were used. The use of arrowroot starch T S is perhaps the one point on which there is nearly unanimous agreement among workers on thyroid.

Complaints are frequently heard about the fading or slipping of the end-point. It can be discharged and will return, and this may be repeated several times. Some believe that this may be due to the presence of iron or manganese. Hunter has shown that the presence of iron in the thyroid, or added in reasonable amounts before the fusion, does not affect the end-point. If manganese be present, for example, in the hypochlorite, the end-point will not be sharp and the results probably high.

If all of the factors herein discussed are carefully controlled, a sharp end-point should be obtained. We believe that if the solution does not show a return of the blue color until after at least thirty seconds, the true end-point has been reached. We have also found that traces of chlorine, bromine, or nitrous acid in the laboratory atmosphere may influence the slipping of the end-point.

A Blank Test—U S P X does not require that a control test be made. We believe that even if the purity of the reagents is assured, it is still important to accompany each set of determinations with a control test, and to apply the correction so established. The control test must start with the fusion, and may if desired be performed upon reagent casein to more nearly simulate the actual fusion.

The control will also take cognizance of the bulk of chlorate present. It must be constantly borne in mind that one is performing almost a micro-determination, and that a two-hundredth normal solution is being used in the titration. A blank of from 0.4 to 0.6 cc of thiosulphate at least will be regularly obtained by the experienced operator, which, on a 1-Gm sample of thyroid, means over 3 per cent of the total iodine present.

METHOD RECOMMENDED FOR U S P XI

The method recommended for incorporation in U S P XI agrees in principle with that official in U S P X. The changes that have been made are for the purpose of clarifying the directions and eliminating the uncertainties therein.

Procedure—Thoroughly mix 1 Gm of Thyroid, finely powdered and accurately weighed, with 15 Gm of an intimate mixture of 138 parts by weight of anhydrous potassium carbonate, 106 parts of anhydrous sodium carbonate and 75 parts of powdered potassium nitrate in a nickel crucible of about 125 cc capacity and spread an additional 5 Gm of this mixture evenly over the surface. Heat the crucible with the flame of a Bunsen burner at such a rate as to attain a dull red color in ten minutes and continue the heating at the same temperature for an additional ten minute period. At the end of this time the carbonaceous material is completely oxidized and the mixture has just begun to melt around the wall of the crucible. Cool the fusion mixture and place the crucible and contents in a 400 cc beaker. Add 150 cc of hot distilled water and stir until the contents of the crucible are completely dissolved. Transfer the solution to a 500 cc Erlenmeyer flask and rinse the beaker and crucible with four 10 cc portions of hot water adding the rinsings to the solution in the flask. Cool the solution to 15° C and add 50 cc of freshly prepared chlorinated soda T S. Cautiously add 60 cc of diluted phosphoric acid (made by mixing equal volumes of phosphoric acid and distilled water) place the flask on a hot plate and boil the solution until a strip of filter paper moistened with starch potassium iodide T S does not become blue when held in the vapor in the mouth of the flask. The final volume of solution in the flask must be about 175 cc, and distilled water must be added, if necessary, during the boiling to maintain this volume. Cool the solution to about 25° C and add 10 cc of a freshly prepared aqueous solution of potassium iodide (1 in 100). Titrate the liberated iodine with two hundredth normal sodium thiosulphate adding 3 cc of starch T S as indicator shortly before the end of the titration. Conduct a blank determination with the same quantities of the same reagents and subtract the volume of sodium thiosulphate consumed from that consumed by the Thyroid. Each cc of the corrected volume of two-hundredth normal sodium thiosulphate is equivalent to 0.0001058 Gm of iodine.

THE ASSAY OF COMPRESSED TABLETS OF THYROID SUBSTANCE

As a result of our study, it is shown that compressed tablets of thyroid can be assayed by the same method that is used for desiccated thyroid substance. Because of the presence of diluents in the tablets, a larger weight of the sample must be taken for the analysis. The quantity of oxidizing agent (potassium nitrate) in the 20 Gm of fusion mixture used is sufficient to completely decompose the diluents present, but the total time of heating should be extended to twenty-five minutes. No filtration of the solution is required after the fusion has been taken up in water. Although no monograph for thyroid tablets is included in U S P XI, directions for their assay are presented here.

Procedure—Select 50 perfect tablets or enough more than this number to make at least 3.5 Gm of sample weigh accurately and calculate the average weight per tablet. Finely powder the tablets in a clean, dry mortar. Mix 1.5 Gm of the powdered tablets accurately weighed with 15 Gm of an intimate mixture of 138 parts by weight of anhydrous potassium carbonate 106 parts of anhydrous sodium carbonate and 75 parts of powdered potassium nitrate in a nickel

crucible of about 125 cc capacity, and spread an additional 5 Gm of this mixture evenly over the surface. Heat the crucible with the flame of a Bunsen burner at such a rate as to attain a dull red color in ten minutes and continue the heating at the same temperature for an additional fifteen minute period. Proceed as directed under the assay of thyroid, beginning with "Cool the fusion mixture." One cc of two hundredth normal sodium thiosulphate is equivalent to 0.0001058 Gm of iodine. Divide the weight of iodine found by the number of tablets represented by the weight of sample taken to find the weight of iodine per tablet.

Following these procedures as outlined, we have examined sixteen lots of desiccated thyroid powder and compressed, uncoated, tablets from various manufacturers. The results that we have obtained are found in Table I.

TABLE I —COMPARISON OF IODINE CONTENT OF THYROID

Sample	Producer's Claims	Laboratory Results by Revised Method
1	0.218 per cent	0.236 per cent
2	0.0155 mg /tab (Tablet)	0.0154 mg /tab
3	0.132 mg /tab (Tablet)	0.129 mg /tab
4		0.202 per cent
5		0.202 per cent
6	0.40 per cent	0.367 per cent
7	0.0612 per cent (Tablet)	0.061 per cent
		0.128 mg /tab
8	0.22 per cent	0.176 per cent
9	0.1408 mg /tab (Tablet)	0.124 mg /tab
		0.0757 per cent
10	0.0215 per cent (Tablet)	0.090 per cent
		0.0541 mg /tab
11	0.425-0.422 per cent	0.423 per cent
12	0.2868 mg /tab (Tablet)	0.240 mg /tab
		0.117 per cent
13	0.240 per cent	0.223 per cent
14		0.119 mg /tab
		0.0375 per cent
15	0.2251 per cent	0.237 per cent
16	0.0993 per cent (Tablet)	0.0994 per cent
		0.104 mg /tab

SOME PROPERTIES OF ERGOSTETRINE *

BY MARVIN R THOMPSON ¹

Since reporting the isolation of a new crystalline specific alkaloid of ergot (1), it becomes possible to describe some pharmacological and chemical properties of this "X-alkaloid" in pure crystalline form, earlier publications (2) having dealt with the amorphous substance still containing some ergotoxine as impurity. The history of the discovery of this new "X-alkaloid," named "ergostetrine" by the author, with the relationship of ergostetrine to the subsequently reported "ergometrine" of Dudley and Moir (3) and the "ergotocin" of Kharasch and Legault (4), is reviewed elsewhere (5).

ISOLATION AND CHEMICAL PROPERTIES (6, 7)

A 10-Kg quantity of good quality ergot was exhaustively extracted with alcohol and the alcohol was removed at a temperature not exceeding 40° C under reduced pressure. The resulting gummy mass was thoroughly washed with many small portions of acidified water to remove the impure ergostetrine. The aqueous washings were concentrated under reduced pressure, alkalinized to litmus with ammonia, and exhaustively shaken out with many small portions of chloroform. Removal of the organic solvent *in vacuo* resulted in crystallization of ergostetrine. The crystals were washed with chloroform and dried *in vacuo* over calcium chloride. The yield was 983 mg. These crystals melted with decomposition at 148° to 150° C, and exhibited a specific rotation² (0.1% solution in chloroform containing 5% alcohol to increase solubility) of $[\alpha]_D^{25} = -45^\circ$ to 55° . One recrystallization from hot benzol raised the decomposition point to 152° to 154° C. Repeated recrystallization (5 times) from benzol resulted in white radiating, doubly refractive needles up to 1 1/4 inches in length, which, when placed in a bath at 154° C and slowly heated, melted with decomposition at 160° to 162.5° C, and whose specific rotation (0.2% solution in ethyl alcohol) was $[\alpha]_D^{30} = +50^\circ$ ($\pm 10^\circ$ because of weak solution used). Aqueous solutions were alkaline in reaction and also dextro-rotatory, as were solutions in methyl alcohol. Chloroform and benzol solutions were laevo-rotatory. Solutions of either the base or the salts exhibit a high degree of fluorescence. The base is sparingly soluble in water, chloroform and benzol, and is considerably more soluble in ether, ethyl and methyl alcohols. The salts are uniformly highly soluble in water, but much less so in common organic solvents. More precise determinations must await the availability of larger quantities of ergostetrine. Its presence in ergot to the extent of 0.05 to 0.2 mg per-Gm introduces great difficulties in securing working quantities from small-scale laboratory production.

As to the molecular composition of ergostetrine, analyses mentioned in an earlier report (1, 2) showed the substance to consist of C, H, O and N, and that the ratio of these elements to one another was roughly similar to that of hitherto identified alkaloids (ergotoxine, ergotamine, sensibamine, etc.) but that the size of the molecule was definitely smaller than that of the known alkaloids. Due caution must be observed in assigning an empirical formula to the new alkaloid because,

* Scientific Section A Ph A, Portland meeting 1935, skeletonized by author to facilitate publication.

¹ Emerson Professor of Pharmacology, School of Pharmacy University of Maryland.

- I am indebted to Prof G L Jenkins for coöperation in determinations of optical activity.

though simpler in composition than the other alkaloids of ergot, it is still relatively complex. The crystals form in combination with solvent of crystallization, and the extreme difficulty with which the solvent of crystallization can be safely expelled attaches a definite element of doubt to any analytical results.

Dudley and Moir (3, 8, 9) presented analyses on their ergometrine, Kharasch and Legault (10) on their ergotocin, Stoll and Burckhardt (11) on their ergobasine, and Jacobs and Craig (12) on their alkaloid, all confirming my analyses showing the qualitative composition of the molecule and that the molecular weight is definitely less than that of either ergotoxine or ergotamine. It is the belief of the writer that ergostetrine, ergometrine, ergotocin and ergobasine are one and the same substance. All were independently obtained by chemical methods which, though differing in details, proceed in the same chemical direction, ultimately obtaining the crystals of the free base from chloroform, benzol, the chlor-ethylenes, etc., taking advantage of the lesser solubility of the new alkaloid as compared to the other alkaloids in these solvents. The pharmacologic and clinical activity, optical activity, decomposition point, solubility and color reactions, all tend to establish that the four names have been applied to the same alkaloid, in spite of the variously reported minor differences which are very probably due to differences in the degree of purity of the crystals studied. The empirical formula indicated by more recent analyses of ergostetrine (base) is in excellent agreement with that of Stoll and Burckhardt for ergobasine ($C_{19}H_{23}O_3N_3$), which is the same as that found by Jacobs and Craig for their product. The formula suggested with reservation by Kharasch and Legault for ergotocin ($C_{21}H_{27}O_3N_3$), as pointed out by Jacobs and Craig (12), differs from the above formula by C_2H_4O (or $C \cdot H_5OH$, alcohol?), suggesting that the higher molecular weight may be due to analyses of material still containing some solvent of crystallization. Owing to the difficulties of completely freeing from solvent of crystallization, this lies well within the realm of possibility. The somewhat larger molecule suggested by the analyses of ergometrine by Dudley and Moir probably resulted from the same difficulty, or to some remaining impurity.

COLOR REACTIONS OF ERGOSTETRINE

As established in a previous report by the writer (1), ergostetrine gives the usual color reactions of ergot alkaloids. The well-known Van Urk color reaction as modified by the quantitative method of Smith appears to be the more sensitive in comparing the various alkaloids of ergot. Consequently the quantitative data presented were obtained by using this reaction. The reagent consisted of 0.125% *p*-dimethyl-amino-benzaldehyde and 0.1% ferric chloride in 50% (by volume) sulphuric acid. Two cc of a 1-10,000 solution of ergostetrine (base), mixed with 4.0 cc of the reagent, produced a blue color approximately $2\frac{1}{2}$ times as intense as U. S. P. Standard Ergotoxine ethanesulphonate under identical treatment. When 2.0 cc of ergostetrine (base) 1-20,000 was compared with 2.0 cc of the standard ergotoxine ethanesulphonate 1-10,000, the color intensity as determined in the colorimeter was essentially identical. Thus, ergostetrine base produced a color reaction twice as intense as U. S. P. standard ergotoxine ethanesulphonate. Calculating both in terms of free base, the color produced by ergostetrine is approximately 1.68 times as intense as that produced by the ergotoxine represented in the U. S. P. standard salt of ergotoxine. The difference in solvent of crystallization would, of course, account

for some deviation from the above figures, the ergostetrine being crystallized from benzol as above described

These color reactions, therefore, offer no possibility for assaying ergostetrine in ergot preparations without resorting to prior chemical separation of the alkaloids, except as explained in the earlier report (2), in which it was pointed out that simple extracts exhibiting satisfactory color values would necessarily contain all of the ergostetrine present in the parent drug plus variable amounts of the other alkaloids, because of the greater stability and solubility of ergostetrine in the usual menstrua (water or water with alcohol) in the presence of the other alkaloids

ACTION OF ERGOSTETRINE ON THE COCKSCOMB

As pointed out in an earlier report (1, 2), ergostetrine is intensely active in producing cyanosis of the combs of cockerels. Adhering to the U S P procedure, perceptible cyanosis was produced in the combs of some cocks in doses as low as 0.05 mg per Kg. Others were more resistant, but in approximately 50 trials, a dose of 0.1 mg per Kg always produced a definite cyanosis. Doses of 0.1 mg per Kg and upward also produced the characteristic general depression or narcotic symptoms of ergot in the cockerels. Using birds standardized with U S P standard ergotoxine ethanesulphonate, the pure crystalline ergostetrine base was judged to be approximately 160% ($\pm 20\%$) as potent as the standard ergotoxine salt. In general, it was also noted that the cyanosis developed somewhat more quickly in the case of ergostetrine, and that the cyanosis was characterized by a deeper blue-black color in the combs than that produced by ergotoxine or ergotamine, in which blanching is often but not always observed. It is believed that the more prompt action of ergostetrine may result in the actual trapping of more blood in the combs, thus accounting for the more intense darkening, whereas the action of the other alkaloids being slower, forces much more of the blood out into the general circulation before finally trapping the remainder for subsequent exhausting of oxygen to produce cyanosis. In any case, the difference between ergostetrine and the other alkaloids is by no means well-defined, the observation being purely a general impression formed by experience with many tests.

Thus, the official Cockscornb method is not specific in measuring the more important ergostetrine activity in ergot preparations also containing the other alkaloids. The limitations of the method are the same as those mentioned for the colorimetric method.

ACTION ON THE ISOLATED RABBIT UTERUS

The action of pure crystalline ergostetrine on the isolated rabbit uterus shows that the amorphous substance previously reported upon (2) still contained some ergotoxine. Studies with pure ergostetrine reveal that, in marked contrast to ergotoxine, ergotamine, sensibamine and ergoclavine, the rabbit uterus is stimulated into strong contractions by ergostetrine. A study of the illustrations in Figs 1, 2 and 3 shows the stimulative response of the uterine strips to epinephrine and ergostetrine, that ergostetrine inhibits the epinephrine response to only a relatively slight degree, as compared with ergotoxine or ergotamine, and that ergotoxine inhibits or abolishes the stimulative activity of both epinephrine and ergostetrine. This indicates that ergostetrine mainly stimulates sympathetic endings in the rabbit

uterus, gradually giving way to only a slight depression, whereas ergotoxine, ergotamine, sensibamine and ergoclavine are indistinguishable in being mainly depressant to the same sympathetic endings

Fig 1—Isolated strips of rabbit uterus in 50-cc tissue chambers (Used third day after removal from rabbit)

- A—contraction from 0.05 mg epinephrine
- B—slight stimulation from 0.2 mg ergostetrine
- C—strong contractions from 0.4 mg ergostetrine
- D—contraction from 0.05 mg epinephrine showing no inhibition by the 0.2 mg dose of ergostetrine
- E—contraction from 0.05 mg epinephrine showing no inhibition by the 0.4 mg dose of ergostetrine
- F & G—strong contraction from 0.4 mg ergostetrine
- H & H—abolition of ergostetrine contractions by 0.05 mg of ergotoxine
- I—failure of 0.4 mg ergostetrine to cause typical contractions after the ergotoxine
- J—failure of 0.05 mg epinephrine to cause typical contractions after the ergotoxine
- W—replacement of drugged Lock Ringer solution with new solution

Fig 2—Isolated strips of rabbit uterus as in Fig 1 (Used third day after removal from rabbit)

- A—contraction from 0.05 mg epinephrine (lower tracing)
- B—contraction from 0.05 mg epinephrine (upper tracing)
- C—contractions from 0.4 mg ergostetrine
- D—contractions from 1.0 mg ergostetrine Note the definite inhibition of the final epinephrine response produced by these large doses of ergostetrine Ergotoxine in less than one-tenth this dose of ergostetrine causes as great or greater inhibition of the epinephrine response
- W—wash

Thus the well-known Broom-Clark method can measure the ergotoxine type of activity in ergot preparations, but the presence of even small amounts of ergotoxine in such preparations eliminates the possibility of the use of the isolated rabbit uterus to estimate ergostetrine unless complete chemical separation is first resorted to

Considerable variation in sensitivity to ergostetrine was observed in different uteri, as was to be expected. A concentration of 1 3,000,000 caused contractions with an increase in tone with the most sensitive uterine strips, whereas 1 500,000 was necessary to produce definite stimulation in others. Uteri used immediately after removal from the rabbit were the most sensitive. The longer the uterus is kept in the refrigerator before use, the less sensitive become strips from that uterus. After the fourth day in the refrigerator, it has become customary in this laboratory to discard any remainder of the uterus, because ergostetrine in a concentration of 1 50,000 or higher is then often found to be necessary to evoke satisfactory response.

The isolated rabbit uterus provides an excellent method of assaying different

Fig 3—Similar strips of rabbit uterus as in Fig 1 and 2 (Used third day after removal from rabbit)

- A—absence of response to 0.1 mg ergostetrine
- B—strong contractions when additional 0.4 mg ergostetrine added
- C—strong contractions from 0.5 mg ergostetrine
- D—weaker stimulation from 0.4 mg ergostetrine
- W—wash

lots of ergostetrine in terms of a lot preserved *in vacuo* as the standard, since repeated doses produce satisfactorily constant responses in proportion to size of dosage

ACTION ON ISOLATED GUINEA PIG UTERI

Immature virgin guinea pig uteri (as used in Pituitary assays) are much more sensitive to ergostetrine than rabbit uteri (as used in the Broom-Clark procedure). Strong contractions are produced in all types of guinea pig uteri, and this tissue is, therefore, serviceable in assaying different lots of ergostetrine in terms of a lot preserved as a standard. The presence of histamine, tyramine, etc., and the other alkaloids in ergot preparations makes the method worthless for assay purposes, unless such crude preparations are subjected to chemical procedures for separating the various constituents.

ACTION ON CAROTID BLOOD PRESSURE OF ANESTHETIZED CATS AND DOGS

Given orally, the blood pressure is not raised by ergostetrine. Intravenously, the substance usually produces a pressor effect, as described earlier (2), but relatively

enormous doses of crystalline ergostetrine failed to produce the well-known "vasomotor reversal" or reversal of the effect of epinephrine. The production of the "reversal" by the amorphous alkaloid reported earlier (2) shows that the amorphous product still contained appreciable amounts of ergotoxine. Perhaps acutely toxic doses of pure ergostetrine might inhibit the pressor effect of epinephrine to some extent (as observed with ergostetrine and epinephrine on the rabbit uterus) but doses of 2.0 mg per Kg to dogs or cats failed to demonstrate the "epinephrine-reversal" or indeed a definite inhibition of epinephrine response. The pressor effects were feeble when compared with ergotoxine or ergotamine, and a depressor effect was occasionally observed. Chlorotone was used as the anesthetic.

ACTION ON PREGNANT CATS

This was described in the earlier report (2), the chief characteristic being that ergostetrine acts much more promptly and powerfully than ergotoxine, ergotamine, etc. The crystalline product was effective in smaller doses than the amorphous product. This method has little quantitative value.

ACTION ON PUERPERAL HUMANS

This was described elsewhere by Koff (13) for the amorphous product. Studies on the clinical effect of crystalline ergostetrine are described elsewhere by Tuck (14) and others (3, 15). The clinical results now available have caused the obstetricians involved to refer to the new alkaloid as "the true active principle" of ergot. It appears to account for the greater part of the traditional oxytocic activity of whole ergot, being far more effective than any constituent of ergot hitherto investigated. The ergotocin of Kharasch and Legault and the ergometrine of Dudley and Moir are apparently indistinguishable from ergostetrine in clinical effectiveness (3, 13, 14, 15, etc.), supporting the view that all three are identical.

The sensibamine used in these studies was obtained in the form of "Ergone," distributed by Parke, Davis & Co. The ergoclavine was kindly supplied by Dr Joseph Rosin, Merck & Co.

A STUDY OF THE ANESTHETIC PROPERTIES OF TRICHLORETHYLENE *¹

BY JOHN C KRANTZ, JR , C JELLEFF CARR AND RUTH MUSSER

INTRODUCTION

Since the work of Plessner (1) trichlorethylene has had a rather extensive use in the treatment of trigeminal neuralgia. The pharmacology of trichlorethylene was studied extensively along with other chlorinated ethylene compounds by Joachimaglu (2). Owing to the fact that this compound was used by Love (3) in the treatment of angina pectoris, its action on the coronary vessels (4) and on the perfused leg vessels of the frog (5) was studied by the authors. During these investigations, the anesthetic properties of the drug were investigated and are reported in this communication.

EXPERIMENTAL

Material Employed—The trichlorethylene used in these experiments was supplied through the courtesy of David A Bryce of the Calco Chemical Co and met the requirements set forth by Tschentke (6).

Inhalation Anesthesia in the Albino Rat—Rats weighing 120–175 Gm were placed under a bell jar and 1 cc of trichlorethylene was permitted to volatilize

in the atmosphere of the jar. Within 4 to 5 minutes, the rats were usually under surgical anesthesia. The animals were then removed from the jar and allowed to recover. The recovery was prompt, generally occurring within 10 minutes. The treatment was repeated six times weekly over a period of five weeks. A summary of the effect of this treatment on 4 rats along with a control growth curve is shown in Chart 1.

* Scientific Section A PH A, Portland meeting 1935

¹ From the Department of Pharmacology School of Medicine University of Maryland

Four additional experiments were conducted with mature male rats weighing between 200 and 250 Gm. In these experiments, the animals did not suffer a loss in weight after 19 consecutive daily anesthetics.

On the twentieth day, the four larger rats were killed by decapitation and the parenchymatous viscera were examined by C. G. Warner of the Department of Pathology. In gross, the appearance of the rats was normal. There were some histological changes in the kidneys that were fairly constant in the exposed animals and practically absent in the controls. These were congestion and dilatation of the glomerular tufts with occasional hemorrhage in the proximal tubules. Granular changes in the cytoplasm of liver cells were inconstant and not conclusive. The lungs of the exposed animals showed some emphysema and intraalveolar hemorrhage.

Rectal Anesthesia in the Rabbit—Trichlorethylene was dissolved in various concentrations in mixtures of ethyl alcohol, glycerin and castor oil. These solutions were administered to rabbits (24 animals) by high rectal injections in amounts to provide 3.7 cc of the drug per kilo. By this avenue of entrance, the trichlorethylene was ineffective in producing anesthesia. The drug was exceedingly irritating to the colonic mucosa.

Influence of Inhalation Anesthesia on Blood Sugar Level—Rabbits weighing about 2 kilos were anesthetized according to the technique set forth in the anesthesia experiments using 5 cc of trichlorethylene. Prior to anesthetizing, the animals were fasted for 24 hours. Their fasting blood sugars were determined by the Folin method (7) and also determined subsequently as shown in Table I.

TABLE I—INFLUENCE OF TRICHLORETHYLENE ANESTHESIA ON BLOOD SUGAR OF RABBITS

Rabbit No	Fasting	Mg per 100 Deep Anesthesia	Cc of Blood Recovery (20 Minutes)
1	107	126	118
2	105	112	125
3	91	116	118
4	104	93	119
5	111	121	137
6	91	131	121

TABLE II—SHOWS RISE AND FALL OF BLOOD PRESSURE AND CHANGES IN RESPIRATION FOLLOWING STIMULATION OF THE SCIATIC NERVE BEFORE AND AFTER LOCAL APPLICATION OF TRICHLORETHYLENE TO THE SCIATIC NERVE. TWO EXPERIMENTS, SEPTEMBER 13 AND 15, 1934

No		Stimulation of the Sciatic Nerve	Blood Pressure Measured by a Mercury Manometer				Respirations per Minute		
			Before mm	After mm	Fall mm	Rise mm	Before No	After No	Change No
Dog 1									
1	Normal, before trichlorethylene		160	170		10	18	20	+ 2
2	Trichlorethylene peripherally		160	172		12	20	10	- 10
3	Trichlorethylene centrally		164	170		6	10	20	+ 10
4	Trichlorethylene peripherally		164	170		6	18	22	+ 4
5	Trichlorethylene centrally		164	172		8	18	22	+ 4
6	Trichlorethylene by tracheal inhalation		164	140	24		30	160	+130
7	Trichlorethylene by tracheal inhalation		164	152	12		90	70	- 20
Dog 2									
1	Normal, before trichlorethylene		130	136		6	15	20	+ 5
2	Trichlorethylene peripherally		130	136		6	15	20	+ 5
3	Trichlorethylene centrally		130	136		6	15	19	+ 4

Trichlorethylene on Nerve Conductivity—To determine the capacity of trichlorethylene to block nerve conductivity, an area of the sciatic nerve of a dog anesthetized with ether was exposed and subjected to faradization and the respiratory and blood-pressure responses were noted. A sling of trichlorethylene was placed around the nerve for several minutes and the nerve stimulated peripheral to the sling. These experiments are also shown in Table II.

SUMMARY

Trichlorethylene may be used by inhalation to produce anesthesia in the rat. The anesthesia in the rat and rabbit is accompanied by marked stimulation of the skeletal musculature. Repeated anesthetizing did not markedly influence the growth or important viscera of the rat. The compound was incapable of producing anesthesia when administered rectally. During inhalation anesthesia in the rabbit, a mild hyperglycemia results. Trichlorethylene applied to the sciatic nerve, was incapable of blocking the blood pressure and respiratory responses of faradization.

A SIMPLIFIED ASSAY FOR THE OFFICIAL IODINE-IODIDE SOLUTIONS *¹

BY WILLIAM F REINDOLLAR ²

Solutions of iodine, containing potassium iodide, have been employed as therapeutic agents since the recognition of the germicidal properties of the former substance. Two of the most important of these products are the tincture and the compound solution of iodine. The former is an alcoholic liquid containing 7 Gm of iodine and 5 Gm of potassium iodide in 100 cc, the latter is an aqueous fluid having 5 Gm and 10 Gm, respectively, of iodine and potassium iodide in each 100 cc. These two galenicals have enjoyed recognition in the last five Pharmacopœias, and have both been accepted by the Committee on Scope of the forthcoming Standard. Furthermore an Antiseptic Solution of Iodine (1), having a concentration of 2.0 Gm of iodine and 2.4 Gm of potassium iodide, respectively, in 100 cc is being considered for admission.

The U S P provides assays for the iodine and potassium iodide content of both of these agents. The respective assays are similar in each case and are herein briefly described.

* Scientific Section A Ph A Portland meeting 1935

¹ Contribution of Bureau of Chemistry State of Maryland Department of Health

² The author wishes to express his appreciation to Dr William M Thornton Professor of Analytical Chemistry of the Johns Hopkins University, for helpful suggestions offered during the course of this work.

Potassium Iodide—A measured quantity of the solution is evaporated to dryness on a water-bath, small successive portions of distilled water are added from time to time until the iodine has been completely volatilized, the dried residue is weighed and qualitative tests for the potassium and iodide ions are made

Iodine is determined volumetrically upon a measured aliquot by titration with 0.1N sodium thiosulphate solution

These assays embody several undesirable features

(a) The determinations require two 5 cc portions Tincture of Iodine is marketed to day largely in small individual bottles which frequently contain less than 10 cc This condition requires the purchase and mixing of two samples

(b) The assay for potassium iodide is in fact a total solids determination Provided that sufficient potassium iodide be added to respond to the qualitative tests, a much cheaper salt might be substituted for the balance, and escape detection

(c) The determination of potassium iodide, particularly in the case of the compound solution is time consuming, four hours are required for some samples

(d) Sodium thiosulphate solution, unless carefully prepared and preserved will deteriorate and require frequent standardization

The recognition of these defects has lead to the proposals of numerous other procedures for the determination of one or both of the ingredients Among those suggested have been the determination of iodine colorimetrically (2) and by converting to iodide with zinc and precipitating with silver nitrate (3), the determination of potassium iodide argentimetrically (4), or by difference after determining free and total iodine (6, 7) Other assays (8, 9, 10) employ modifications of the iodine cyanide method of Rudolf Lang (11) The following procedure, devised in this laboratory is believed to be simpler than any of the foregoing and to be free from the objections raised against the official methods

Five cc of the solution is measured into an iodine flask and the free halogen is titrated with 0.1N alkaline potassium arsenite solution using starch indicator Fifty cc of concentrated hydrochloric acid and 5 cc of chloroform are then added, the mixture is well cooled and then titrated with M/20 potassium iodate solution until the chloroform layer is colorless The iodine may be calculated from the number of cc of 0.1N potassium arsenite required, the potassium iodide from the difference in cc, between the amounts of potassium iodate and potassium arsenite solutions used The reactions may be represented by the following equations

EXPERIMENTAL

The volumetric reagents were prepared from C P chemicals The arsenite and thio-sulphate solutions were standardized with Baker's reagent iodine, the iodate solution with Bureau of Standards arsenic trioxide The 0.1N potassium arsenite solution was made to contain a definite excess of potassium bicarbonate as recommended by Gooch (12) to neutralize the hydriodic acid formed

A comparative study of this and the U S P assays was made upon three galenicals, Tincture of Iodine U S P X, Antiseptic Solution of Iodine, U S P XI (proposed), and Compound Solution of Iodine U S P X The first and last were obtained by mixing the residues of a number of previously assayed samples, known to approximate the proper concentrations, the second was carefully prepared from U S P chemicals The results of this investigation are tabulated

Sample	Iodine		Potassium Iodide	
	U S P	Volumetric	U S P	Volumetric
Tincture of Iodine X	7 42	7 42	5 38	5 48
	7 42	7 45	5 36	5 44
	7 43	7 44	5 42	5 36
	7 43	7 43	5 42	5 38
Tincture Iodine XI	1 98	2 00	2 40	2 42
	2 00	2 00	2 42	2 45
	1 99	2 00	2 43	2 42
	2 00	2 00	2 44	2 43
Lugol's Solution	4 70	4 70	10 16	10 15
	4 67	4 72	10 12	10 10
	4 70	4 69	10 14	10 12
	4 70	4 68	10 18	10 11

DISCUSSION

Owing to the high concentration of potassium iodide in Lugol's Solution the amount taken for assay was 4 cc, in addition the volume of concentrated hydrochloric acid was increased to 75 cc for this product and for the U S P X tincture. Slight modifications of the quantity taken for assay, in order to maintain proper concentrations will make this method applicable to Churchill's Tincture of Iodine or any similar preparation. The results of this assay compare favorably with those obtained by the U S P method and the following advantages are claimed for it: (a) It permits the estimation of the two constituents upon one portion, thus conserving the sample, (b) it employs, for the estimation of iodine, a solution that is not only quite stable, but one that may be prepared directly from arsenic trioxide—a primary standard, (c) it substitutes a volumetric for a gravimetric estimation in the potassium iodide determination, hence is less time consuming, (d) in the latter portion of the assay it employs a reagent that is specific for the iodide ion.

SUMMARY

A new assay has been devised for Iodine-Iodide Solutions.

The results obtained by this method are in good agreement with those secured by the United States Pharmacopœia.

THE PHARMACOPŒIA OF THE UNITED STATES AND THE FEDERAL
FOOD AND DRUGS ACT *

J H BEAL, FORT WALTON, FLORIDA

The primary purpose of a pharmacopœia is to present a list of approved medicinal agents which have been standardized as to identity, purity and strength, so that the same title shall always apply to a substance of the same properties and potency. Even a layman can understand the danger to human life if the title "Tincture of Aconite" referred to a preparation of one strength in Portland, Oregon, and to one of a different strength in Portland, Maine.

In all of medicine and pharmacy there is probably no matter of greater importance than the principle that drug preparations dispensed under the same title shall always possess the same essential properties and be of the same potency. Accordingly in every country having a national pharmacopœia it is the custom to consider that the official title of a drug, unqualified by other words, always refers to a drug having the identity, strength, quality and purity prescribed in the pharmacopœia of that country. If this were not true the primary purpose of a national pharmacopœia would be defeated.

Practically every civilized nation has an official pharmacopœia governing the character and strength of the medicinal agents dispensed on physicians' prescriptions within its own territorial limits. In countries other than the United States the committees which revise their several pharmacopœias are appointed by some political department of their respective governments, whereas the Committee of Revision of the Pharmacopœia of the United States is elected by a convention of physicians and pharmacists, and of other professional and scientific men who are in some way concerned with the production or use of drugs and medicines.

ORIGIN AND METHOD OF REVISION OF THE PHARMACOPŒIA OF THE UNITED STATES

The Pharmacopœia of the United States belongs to and is under the absolute and complete control of the United States Pharmacopœial Convention, a society which has had a continuous existence of one hundred and fifteen years, in which period it has issued ten revisions of the Pharmacopœia, the Eleventh Decennial Revision being now in process of printing.

The United States Pharmacopœial Convention originated as a voluntary national association of physicians in 1820, and continued as a voluntary association, first of physicians only, and later of physicians and pharmacists, for eighty years. In 1900 the Convention was incorporated under the laws of the District of Columbia, and its membership now includes not only physicians and pharmacists, but also representatives of numerous scientific institutions and societies, and societies of law enforcement officials.

At the last assembly of the Convention in Washington in 1930 its membership included delegates from the American Medical Association, the AMERICAN PHARMACEUTICAL ASSOCIATION, the American Chemical Society, and from four other national societies relating to medicine, pharmacy or chemistry, from four national societies of officials who are charged with the duty of enforcing either

* Presented at the 83rd annual meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION Portland, Oregon, Aug 5-10, 1935

national or state food and drug laws, from six departments or divisions of the U S Government which are concerned with medicine or with the enforcement of Federal drug laws, from forty-five medical colleges and university medical departments, from fifty-five colleges of pharmacy and university departments of pharmacy, and from twelve other colleges and universities. In addition to delegates from colleges and universities there were representatives from sixteen state medical societies, from thirty-six state pharmaceutical societies, and from eighteen other institutions and societies having to do with the medical sciences.

Of the more than four hundred delegates present at the 1930 meeting of the U S P Convention, only nine represented societies directly connected with trade or industry, so that the influence of commercial interests in the making of the Pharmacopœia may be regarded as practically nil.

This Convention of Delegates has absolute control of the affairs of the Pharmacopœia in every particular. It elects and instructs the Board of Trustees and the General Committee of Revision, and every act of these two bodies is subject to revision or disallowance by the next assembly of the Convention.

The General Revision Committee of fifty members in turn elects a smaller Executive Committee which directly handles the revision work, all decisions of the latter being subject to approval by the General Committee.

The members of the Board of Trustees, which handles the financial and business affairs of the Pharmacopœia between assemblies of the Convention, receive only their actual traveling and clerical expenses incurred in the service of their office. Any profit from sales of the Pharmacopœia must be devoted to research work upon pharmacopœial subjects, and cannot be diverted to any other purpose.

Thus while the U S P might be technically defined as private property, its purpose and its services are of a most decided public character.

The standing of the U S P among pharmacopœias of the world is indicated by the fact that it has been translated into the Chinese language and is used as the official standard of the Republic of China. The Spanish translation has been adopted as the official pharmacopœia of the governments of the Philippine Islands and of the Island of Porto Rico, and is officially recognized by the independent Republics of Cuba and Costa Rica. The Spanish edition also has a wide distribution throughout the other Spanish-speaking nations of the Western Hemisphere.

SHOULD THE PHARMACOPŒIA BE DELETED FROM THE FEDERAL FOOD AND DRUGS ACT?

Some of those who have been confused by the alleged private property status of the United States Pharmacopœia, and also by the controversy over the inclusion or non-inclusion of a so-called variation clause, have somewhat hastily reached the conclusion that the Pharmacopœia should be deleted entirely from the Federal Food and Drugs Act, which would lead to the rather strange result that only official drugs and medicines would then be exempt from the requirements of the Federal law. Under such a situation all other drugs and medicines, including patent medicines, would be required to conform to certain standards of purity, quality and strength, and to be truthfully labeled and advertised, while official drugs and medicines could be adulterated, to any extent, and still be admissible to interstate commerce without let or hinderance from either Federal or other authority.

Legally the crime of adulteration exists when the qualities of a substance differ from those of a recognized standard. If there is no recognized standard then there is no ground upon which a charge of adulteration can be legally sustained.

Surely those who have advocated that reference to the Pharmacopœia be omitted from the Federal Act have not fully considered all the consequences of such deletion.

SHOULD REFERENCE TO THE U S P IN THE FEDERAL FOOD AND DRUGS ACT BE COUPLED WITH A VARIATION CLAUSE?

Another conclusion stoutly defended by some students of the subject is that the U S P (along with the other named authorities) should be included in the Federal Food and Drugs Act, but should not be coupled with a variation clause.

(By a "variation clause" we understand any clause or provision in the law which permits variation from the otherwise prescribed standards upon condition that the products are so labeled as to prevent their confusion with those which profess to comply with such standards.)

Those who contend that no variation from pharmacopœial standards should be permitted under any circumstances exclaim, with apparent logic, "What is the use of having a legal standard, if compliance with it is purely voluntary, and if manufacturers and dealers may follow some other standard by merely stating that fact upon the label?"

The writer agrees with the thought implied in this question in so far as it applies to drugs dispensed upon physicians' prescriptions or which are sold under their official titles for medicinal purposes, but as will be seen on further study, there are numerous cases where the practical necessities of interstate commerce, as well as other considerations, require that departure from official standards be permitted under certain circumstances, provided no deception is attempted or accomplished, and provided also that the facts are truly and clearly stated upon the label.

In the first place it should be remembered that a Federal Food and Drugs Act is based upon the constitutional powers of Congress to regulate interstate commerce and, therefore, applies exclusively to foods and drugs while they are the subjects of interstate commerce. Before they enter into or after they have left the domain of interstate traffic, the regulation of their further distribution rests solely with the police powers of the states in which they are located. Except in places under exclusive Federal jurisdiction, as the District of Columbia, any Federal law regulating the distribution of untaxed drugs, on prescription or otherwise, after they have left the domain of interstate commerce, would be null and void, and of no more legal effect than the utterance of any private citizen.

The first part of the definition for drugs as it appears in the Copeland Bill¹ [S 5, Sect. 201, paragraph (b)] reads as follows: "*(1) All substances and preparations recognized in the United States Pharmacopœia, Homeopathic Pharmacopœia of the United States, or National Formulary, or any supplement to any of them.*" It will be noted that this definition does not apply merely to substances and preparations intended for medicinal use, but to every substance and preparation bearing a name

¹ The following discussion is based upon the Copeland Bill which with or without further modification will probably soon supersede the Act of June 30, 1906.

mentioned in any one of the three stated official compendiums, or in any supplement thereto, whether intended for medicinal or other purposes

Again one of the definitions of an adulterated drug, Sect 401, paragraph (b), provides that a drug shall be deemed to be adulterated "*If its name is recognized in an official compendium¹ [i e., U S Pharmacopœia, Homeopathic Pharmacopœia or National Formulary], or if it purports to be a drug the name of which is so recognized and it differs from the standard of strength, quality or purity as determined by the tests or methods of assay set down therein,*" etc

And finally, under the provisions for misbranding [Sect 402, paragraph (h)] it is declared that a drug shall be deemed to be misbranded, "*if its name is recognized in an official compendium, or if it purports to be a drug the name of which is so recognized and it is not packaged and labeled as prescribed therein, unless exempted under (1) of this Section*"

From these definitions it seems clear that unless a variation clause be included in the Federal Act it will be unlawful to ship in interstate commerce any drug named in the U S P unless it fully complies with standards of strength, quality and purity, and the methods of labeling and packaging prescribed therein

It is true that a prefatory notice in the U S P specifically states that its standards "*are intended to apply solely to substances which are used for medicinal purposes and when professedly bought, sold or dispensed as such,*" but this limitation is nullified by the language of the Bill, which makes "all substances and preparations recognized in the U S P" subject to the requirements of the Act

Now it happens that one hundred and forty or more of the substances named in the Monographs and List of Reagents of U S P X are the names of agents, many of them belonging to the class commonly known as heavy chemicals, which are more largely employed in the arts and industries than for medicinal purposes

Among such chemicals we readily call to mind hydrochloric, nitric, sulphuric, acetic and phosphoric acids, the salts of iron, copper, zinc and manganese, the fixed alkali hydroxides, many salts of the alkalies and alkaline earths and numerous other agents, the uses of which in the arts and industries far exceed their employment for medicinal purposes While a few hundreds or a few thousands of pounds of some of these agents would satisfy the strictly medicinal requirements of the United States, their employment in dye and paint manufacture, in metallurgy, in the manufacture of soaps, paper, fertilizers, textiles, leather, insecticides, fungicides and in the production of numerous other largely used commodities amounts to many thousands or even hundreds of thousands of tons in a single year To require that these vast quantities of chemical should always meet the high standards of quality, strength and purity prescribed for them when employed medically would be prohibitive of their commercial and industrial uses To make the U S P the standard for drugs in the arts and industries would be to thrust upon it a duty which it is entirely unfitted to discharge, and which it expressly disclaims in its prefatory notes

Putting aside the opinions of lawyers and appealing to our own common sense, is it conceivable that the United States Congress would knowingly adopt or

¹ By definition, Sect 201 paragraph (m) "official compendium" is understood to refer to any one of the three United States Pharmacopœia Homeopathic Pharmacopœia or National Formulary

that the Federal Courts would sustain the validity of such a rigid and unreasonable requirement?

From these considerations it seems clear that the necessities of commerce practically compel the insertion of a provision in the law which will permit the interstate transportation of drugs of other than pharmacopœial quality when labeled so as to indicate their true character

VARIATION CLAUSE NECESSARY TO PERMIT IMPROVEMENT IN PHARMACEUTICAL SUBSTANCES

Another reason for the presence of a variation clause is that it is necessary in order to permit improvement in official drugs and preparations in the interim between decennial revisions of the U S P and between the issuance of supplements thereto

That the qualities prescribed for U S P drugs and preparations are not beyond improvement is shown by the fact that the specifications for many of them are altered with each succeeding revision of that volume—changes in the percentage of active constituents, in solvents and menstrua, in solubility, melting and boiling points and other physical constants, in the purity rubric, in methods of packaging, etc., etc. The necessities for these changes are not discovered all at once on the eve of a new issue of the Pharmacopœia, but come to light from time to time during the entire decade within which a given issue is in effect

Unless the law provides some proper form of variation clause no improved product could be transported in interstate commerce until a new issue of the Pharmacopœia, or of a supplement, recognized such change. The improvement might be of the highest importance to human health and life, yet the producer could not ship his product across state lines by mail, express or freight, or carry it in person—even with the most elaborate precautions of labeling to show that the preparation did not purport to comply with Pharmacopœial standards, and specifically designating the particulars in which it differed therefrom

His only recourse would be to market it as a proprietary specialty, under a coined name, which he would be perfectly free to do, and thus the absence of a proper variation clause would act as a direct encouragement to the further multiplication of a variety of preparations of which we already have too great a surplus

VARIATION CLAUSE IN RELATION TO THE DELEGATION OF LEGISLATIVE POWER

The presence of a variation clause in the Food and Drugs Act is also closely tied up with the judicial doctrine that legislative bodies cannot delegate to others the legislative powers vested in them by a written constitution

The United States Constitution (Article I, Sect. 1) recites that "*All legislative powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives*"

By an unbroken line of judicial decisions it has been settled that the intent and effect of this Article is to prevent the Congress from transferring any of its law-making powers to any other body, public or private, or to any administrative officer or other individual. Recent decisions in the code cases have re-affirmed and emphasized this interpretation of the Constitution, and have declared that the Congress cannot confer even upon the President of the United States the power to

designate and define acts which shall be regarded as criminal, and for which citizens may be punished by fine or other penalties

The inclusion in the Food and Drugs Act of an issue of the U S P in existence at the time the law is enacted would be distinctly an Act of the Congress itself, as much so as if the language of the U S P had been copied in the Bill, and could not, therefore, be regarded as a delegation of legislative power, but how about later editions of the book, creating new standards, and coming into effect after the law has been placed on the statute books?

By the terms of the Act [Sect 201, paragraph (m)], the particular issue of the Pharmacopœia which shall apply in determining the charge of adulteration or misbranding is the one which shall be "*official at the time any drug * * * * is introduced into interstate commerce*"

It may happen, therefore, that a drug which fully complied with the Pharmacopœia official at the time the law was enacted will not comply with the standards of a later edition of that volume. Would the shipment of such a drug be punishable as a crime under the Food and Drugs Act? If so, it would not be a crime created by the direct act of Congress, but by the action of the U S P Revision Committee in changing the standards after the enactment of the law.

This was the particular question considered in "*The State of Ohio vs Emery,*" reported in 54 Ohio State Report, page 365, which may be regarded as the leading case on this subject.

The Ohio statute, enacted in 1890, while the 1880 Revision of the U S P was still in effect, declared a drug to be adulterated "*(1) If sold under or by a name recognized in the United States Pharmacopœia it differs from the standard of strength, quality or purity laid down therein*" The statute did not contain a clause permitting variations from the standards of the Pharmacopœia if properly labeled so as to show such variation.

Subsequent to the enactment of the statute the 1890 Revision of the Pharmacopœia became official, and by a regulation of the Ohio Food and Dairy Commissioner was adopted as the standard of his Department, and in Oct 1895 the defendant Emery was arrested for the sale of adulterated cochineal.

On trial of the case it appeared that the cochineal did conform to the standards of the 1880 Pharmacopœia—the issue official at the time the law was enacted—but did not conform to the standards of the 1890 Revision.

Attorneys for the State contended that under his authority to make rules and regulations for the administration of the Act the State Food and Dairy Commissioner had authority to substitute the standards of the new Pharmacopœia in place of the standards of the 1880 Revision.

Counsel for the defendant contended that the legislature could not adopt as part of the penal laws of the State the contents of a book not then in existence, and that it could not confer upon the Food and Dairy Commissioner authority to designate a different standard than that adopted by the legislature, since to do so would be an unconstitutional delegation of the law-making power.

The Supreme Court of the State of Ohio sustained the contention of the defendant's counsel in the following language:

The reference in the statute to the United States Pharmacopœia, could be to no other than the edition of the book in use and recognized when the statute was enacted and went into effect.

fect, which was the edition known as that of 1880. It is not to be supposed that the legislature intended to adopt by reference, as part of the penal laws of the State, an edition of the book not then in existence, and of the contents of which the legislature could have no knowledge. The drug with the sale of which the accused was charged was recognized in the edition of 1880, by the name under which it was sold, and a standard of strength, quality and purity therein laid down. It is not claimed the drug sold was below that standard, and the sale could not be rendered unlawful because it is below a higher standard laid down in a subsequently revised edition of the book, though that edition was in use at the time of the sale. To hold that the sale could thus be made unlawful would be equivalent to holding that the revisers of the book could create and define the offense, a power which belongs to the legislative body, and cannot be delegated."

It will be noted that this decision sustains the power of the legislature to adopt an existing Pharmacopœia as part of the law, but denies its power to authorize the substitution of a later issue for the one in force when the law was adopted.

Although rendered in the construction of a state enactment, the rule laid down in the Emery case has been generally regarded as equally applicable to Federal laws, and this decision was really responsible for the insertion of the variation clause in the Federal Food and Drugs Act of June 30, 1906.

The theory upon which it is argued that the insertion of a variation clause will save the statute from the charge of being an unconstitutional delegation of power is that it will permit the manufacturer to freely select the standard which he chooses to follow, provided his labels indicate the facts truthfully and clearly. In plain English it gives the manufacturer the option either of following the standards of the U S P or other standards as he may prefer, provided that if he elects to follow some other standard the label shall plainly indicate the fact. Thus the manufacturer's liability and obligations always remain the same no matter how frequently the standards of the Pharmacopœia are altered.

If the manufacturer is always free to choose the standards with which his preparations shall comply, then no change in the Pharmacopœia can affect his property rights or legal obligations, and consequently there is no exercise of law-making power when the Revision Committee changes the standards of the Pharmacopœia.

TITLES USED IN U S P TAKEN FROM COMMON LANGUAGE

Another thought to be taken into consideration is that the titles employed to designate U S P chemicals and preparations are, in a majority of cases, taken directly from the English language, and do not represent any invention or discovery on the part of the revisers of that volume.

If one were to seek a copyright upon such titles as Tincture of Aconite or Hydrochloric Acid the application would be refused upon the ground that these are common words of the English language, the use of which is free to all, and that they may not be monopolized so as to represent exclusively the product of a single individual. If these titles cannot be monopolized to distinguish the products of a particular manufacturer, upon what ground can it be argued that their incorporation in the U S P confers upon them such special qualities that they can no longer be used in their ordinary English sense, especially when coupled with other qualifying words which plainly indicate that the products to which they are attached do not profess to comply with U S P requirements.

To hold that when common nouns and adjectives are once incorporated in the U S P they can—in the absence of deception—no longer be employed in their

original and ordinary senses, would be to establish a rule of law never before recognized in this or any other country

PRIMARY PURPOSE OF FOOD AND DRUGS ACT TO PREVENT FRAUD AND DECEPTION

The primary and fundamental purpose of a food and drugs act is not to compel the use of certain products in preference to others, but to prevent fraud and deception in the sale of such substances—to prevent the sale of adulterated or harmful foods as pure and wholesome, or the delivery of adulterated or sophisticated drugs in place of those which are pure and genuine, or as in the case of cosmetics or package medicines, to insure that they shall not contain harmful or dangerous ingredients. It seeks to accomplish these results by requiring that labels and advertising shall state necessary and material facts, and shall not bear false and misleading statements, that inferiority shall not be concealed by the use of color or other artifice, or that the form of package shall not be such as to mislead the purchaser as to the quantity of its contents. In short, it aims to provide the means whereby the purchaser, from an inspection of the package, the label or the advertising, can determine whether the product possesses the qualities he seeks, and to insure that he shall receive what he expects and pays for. If the package, the label and the advertising clearly and truthfully set forth the character of the product the primary purpose of the law is accomplished.

SUMMARY

In the preceding pages it has been sought to justify the following conclusions

1 That a Federal Food and Drugs Act as represented by the Copeland Bill, applies exclusively to foods and drugs while they are within the domain of interstate commerce. By the use of no language can the Federal law be made to apply to commerce after it has lost its interstate character. After once mingling with the goods of a particular state, only the laws of such state can fix the qualities which drugs must possess in order to permit their lawful distribution therein.

2 That the definitions for drugs, and for adulterated and misbranded drugs as found in the Copeland Bill are such that without the addition of a proper variation clause, only such drugs as complied with U. S. P. standards of strength, quality and purity could be lawfully transported in interstate commerce, a condition which if it prevailed would prevent the shipment of hundreds of thousands of tons of drugs and chemicals commonly used in the arts and industries.

3 That each new revision of the U. S. P. presents numerous changes in the standards of strength, quality and purity of the drugs described in its monographs, and also introduces new drugs and preparations which were not commonly used or even known when the preceding volume was issued. If the law-making body confers upon the revisers of the Pharmacopœia blanket authority to change the legal obligations of the citizen so as to render him liable to fine and imprisonment for acts which would have been innocent in law if the Pharmacopœia had not been revised, it would seem fairly evident that there has been an attempted delegation of law-making power.

On the other hand, if the law permits the use of U. S. P. titles which are parts of common English speech, upon articles not of U. S. P. standards, upon condition merely that the label states the fact of such variation, then no new obligation is

forced upon the producer when a new Pharmacopœia becomes official Under any revision of the Pharmacopœia his legal liability remains the same, he will always have the option either of observing U S P standards or of stating upon the labels wherein his product differs from such standards

4 That it is the common understanding among physicians and pharmacists and taught in all colleges of pharmacy, that the use of a U S P title without the addition of qualifying adjectives or other explanatory words, implies that the product to which it is attached complies with U S P standards of strength, quality and purity Unless this be the rule, the primary purpose of the Pharmacopœia—to enforce uniformity in properties and potency—would be defeated

5 That a proper variation clause is one which would require that when a U S P title is attached to a drug of other than U S P standards the qualifying words shall indicate clearly that the drug does not profess to comply with such official standards The wording of the label should not be obscure or ambiguous, but such as to enable the reader to form an intelligent opinion as to the character of the product

6 And finally, that the deletion of the variation clause from the Federal Food and Drugs Act would not close interstate commerce to the shipment of medicinal preparations of official drugs which did not comply with U S P standards The producer would need only to give his product some attractive coined name and ship it as a proprietary specialty, thus setting his own standards, without let or hunderance from any authority

A BRIEF HISTORY OF THE DRUG CODE *

BY E F KELLY

Following the enactment of the National Industrial Recovery Act, the National Association of Retail Druggists appointed a Committee on the Retail Drug Code

Later, a meeting of representatives of the state pharmaceutical associations was held in St Louis, Mo , at the invitation of Drug Center, at which a Committee was named to cooperate with the N A R D Committee in preparing a code for the retail drug trade

These Committees met jointly in Washington, D C , and drew up a code which was sponsored by the N A R D with the approval of the AMERICAN PHARMACEUTICAL ASSOCIATION Representatives of the Drug Institute of America, Inc , also coöperated in writing the Code It was estimated that at least 60% of the retail drug trade of the Country sponsored the code

The original hearing on the Code of Fair Competition for the Retail Drug Trade was held in the auditorium of the Chamber of Commerce of the U S A , Washington, D C , on August 25, 26 and 27, 1933, before A D Whiteside as Deputy Administrator, and Donald Richberg as Legal Advisor It became evident at the first session of the hearing that the Code as submitted would have to be amended and the remainder of the sessions were devoted to an effort to bring about

* Section on Historical Pharmacy, Portland meeting 1935

an agreement between the views of the National Recovery Administration and the representatives of the trade. Finally, a compromise was reached and an amended code was substituted. This code was the subject of a number of private hearings and conferences, and was finally approved by President Roosevelt on October 21, 1933, as a part of the Code of Fair Competition for the Retail Trade with Schedule A applicable to the retail drug trade. A copy of the code with explanations is attached, and it will be noted that drug retailers were subject to the same provisions as the other retailers subject to the code except as amended or supplemented by Schedule A.

Schedule A provided for the administration of the Code as far as the drug trade was concerned, by the National Retail Drug Trade Council composed of two members representing the National Association of Retail Druggists, one member representing the AMERICAN PHARMACEUTICAL ASSOCIATION and one member representing the Drug Institute of America, Inc.—the members to be approved by the NRA.

The Council was approved on October 27, 1933, with the following temporary membership: John A. Goode and John W. Dargavel, representing the National Association of Retail Druggists; E. F. Kelly, representing the AMERICAN PHARMACEUTICAL ASSOCIATION, and Wheeler Sammons, representing the Drug Institute. In November 1933, George M. Gales was added as the representative of the National Association of Chain Stores with the approval of NRA. Later, each of these gentlemen was elected to membership with the exception of E. F. Kelly, representing the A. P. H. A. who served as a temporary representative, since a meeting of this ASSOCIATION was not held in the interval between the time when permanent representatives were requested and the closing of the code organization. At the organization meeting, J. A. Goode was elected *Chairman*, and E. F. Kelly, *Secretary-Treasurer*, of the Council and they served continuously as did each member, throughout the existence of the code. W. H. Johnson was elected *Assistant Secretary* in charge of the office and resigned on April 1, 1934, when he was succeeded by Paul Pearson. E. F. Kelly served as *Executive Secretary* from June 1934 to March 15, 1935, when he was succeeded by W. S. Elkins, Jr.

The name of the Council was changed to the National Retail Drug Code Authority in December 1933. The office was located in the Tower Building, 14th and K Sts., N. W., until May 1, 1934, after which date it was located in the National Press Building, 14th and F Sts., N. W., Washington, D. C.

The Code became effective on October 30, 1933, and, after organizing, the Council undertook the organization of local code authorities. It was recommended that these be set up in each congressional district, except in those cases where two or more congressional districts were included in a city, when the districts were to be combined and a metropolitan code authority composed of representatives of the districts included, was to be organized. The president of each state pharmaceutical association was requested to name three representative druggists in each congressional district to conduct the election of the local or metropolitan code authority. This procedure was unique and proved to be very successful since approximately 420 out of a possible 435 congressional districts were organized and in operation within a short time.

Raising the necessary funds also had prompt attention. A voluntary assess

ment of one dollar per employec was levied for the year ending October 31, 1934, payable to the local or metropolitan code authority of which one dollar per store was to be remitted to the national code authority for its expenses. The remainder was intended for the expenses of the local or metropolitan code authority whose treasurer was bonded, under a budget approved by NRA and subject to audit. The single assessment plan was adopted whereby the retailer paid only to the code authority representing his principal line of business.

The budget submitted in October 1934, and approved in November 1934, covered the six-month period from November 1, 1934 to April 30, 1935, and called for a mandatory assessment of one dollar per employee payable to the local or metropolitan code authority of which fifty cents per store was to be remitted to the National code authority. This was a combined budget and covered \$25,000.00 for the national code authority and \$173,979.05 for the local and metropolitan code authorities.

The National Code Authority adopted a Constitution and By-Laws, which were approved by NRA.

During the life of the code, the following amendments to Schedule A were approved after public hearings:

Amendment No. 2 established a new Loss Limitation clause effective April 7, 1934 making it a violation to sell below the manufacturers' wholesale list price in dozens, provided that all discounts, free goods and allowances made available to all purchasers in dozens be taken into account. The proviso made it necessary for the national code authority to issue lists giving approved minimum prices which proved to be unworkable because of the large number of items affected and because of the frequent changes in prices.

Amendment No. 6—A new Loss Limitation clause was approved, effective September 8, 1934, qualifying Amendment No. 2 by removing the unworkable proviso and giving the Administrator the right to suspend or modify the clause in respect to all articles, the price of which the manufacturer was found to be manipulating unfairly.

Amendment No. 7 provided for mandatory assessments.

Amendment No. 9 provided for the incorporation of the national or local or metropolitan code authorities. The national code authority was not incorporated.

A number of interpretations and administrative orders affecting the drug code were issued by NRA but time will not permit a discussion of them.

Although the Code Authority recognized the need for and the fairness of a reasonable labor mark-up, it realized the necessity of establishing a sound cost definition first as a basis. A request for a labor mark-up was filed in November 1933, and a mass of information in support of such a mark-up was submitted.

The Code Authority has been represented at many conferences and on several committees. The more important were the code meetings in March 1934, when several thousand of the most representative business men of the country were called to Washington to consider the entire question of regulation by codes. As a result, three committees were appointed to study the whole situation and submit recommendations and opinions to the Administrator. These committees were on (1) Capital Goods, (2) Consumer Goods, (3) Retail and Service Trades. Our Code Authority was represented on the second and third of these committees and the needs of the retail druggists were strongly presented.

Many troublesome questions and conflicts between the provisions of the several retail codes have arisen and have required much time and effort. Among

these may be mentioned soaps, medicinal foods, soft drinks, tobaccos, candies, drug sundries of various types, and many other products which are sold by various classes of retailers. These developments have led to closer relations and cooperation between the various retail code authorities. As an illustration, may be mentioned the general agreement for a single assessment under that code representing the principal business of the retailer. This agreement did away with the very troublesome multiple assessment. A strong effort was made to secure a reasonable plan for distributing the Blue Eagles and labor posters, making these easily available to the retail druggists.

It is impossible to enumerate every activity of the Code Authority or to more than indicate the time and effort that has been required. Those acquainted with Governmental procedure, and especially in a new and vast activity, can fully understand the situation.

The Code Authority held regular monthly meetings and many special meetings. Some meetings continued over several days. The correspondence with local code authorities, with individuals and with governmental officials and agencies has been very extensive. The expenses were heavy but the Code Authority operated well within its budget.

No one realizes more clearly than the members of the Code Authority and their associates the disappointments that followed the code efforts, and the apparent inability of those directing NRA to reach decisions and to maintain policies was discouraging. The frequent change in personnel in the NRA greatly interfered with the work and it was difficult to impress upon NRA that the retail drug industry has peculiar duties and processes of its own.

However, the effort and expense are believed to have been justified when the dangers that were avoided and the progress that was made are given full consideration. It has been a fine illustration of the benefits of organization, of the value of ethics and fair play in business, of the fact that a sound system of distribution is to the interest of consumer as well as of distributor, and that a fair price is not necessarily a higher price to the consumer.

With the decision of the Supreme Court in the Schechter case, it was necessary to promptly liquidate the affairs of the national, local and metropolitan code authorities. The national code authority liquidated, with legal advice, by completing its records, by paying its bills, and all expenses in the orderly closing of its affairs. As the national code authority had operated on a small balance, no dispersion of balance was necessary.

It was ordered at the final meeting held on June 8, 1935, that the records of the National Code Authority should be placed in the keeping of the secretary for one year and then turned over to the AMERICAN INSTITUTE OF PHARMACY for such historical use as can be made of them. In this way, the history of this very important social and economic experiment will be preserved and later it is hoped that it may be written up more completely.

THE BADIANUS MANUSCRIPT, AN AZTEC PHARMACOPŒIA *

BY EMILY WALCOTT EMMART ¹

We are so accustomed to think of the introduction of Spanish culture into Latin America during the 16th century that the reciprocal transmission of Aztec learning into Europe has long been a neglected subject. In but one branch of learning, the field of medicine, Mexico has left her stamp upon the pages of European history. Among the works of the great herbalists, Carlos Clusius, Gaspard Bauhin, Colonna, Monardes, Hernandez, Gerard, Parkinson, and others of the 16th and 17th centuries, we find many references to Aztec medical practices. Of these only the volumes of Hernandez and Monardes were devoted entirely to the medical practices of Latin America. These, however, presented native medicine as seen through the eyes of Europeans. Only one Aztec written medical text has thus far come down to us. For the sake of brevity this manuscript has been referred to as the Badianus Manuscript ^{2,3}. This beautiful little manuscript holds the unique position of being the earliest herbal and pharmacopœia written on this side of the Atlantic and contains the earliest illustrations of some 204 plants and trees of Mexico, together with a list of ailments and diseases and the mode of treatment. The original text is the possession of the Vatican Library where its identity has been obscured by the title "Codex Barberini, Latin 241". The precise title of the manuscript is "A book of Indian Medical Herbs composed by a certain Indian physician of the College of Santa Cruz, who is not theoretically learned, but is taught only by experience. In the year of our Lord Saviour 1552." Plate I.

Until approximately six years ago the codex was unknown to the world at large. At that time it was discovered independently and almost simultaneously by Dr Lynn Thorndike and Dr Charles U Clark. Dr Clark brought back to the Smithsonian Institution a photographic copy and it has been from photostats of this that the present study and translation has been made.

The Badianus Manuscript is the work of two Indians who had been educated in the College of Santa Cruz, Mexico City. The text was originally written in Aztec by Martinus de la Cruz whose name appears in the dedication. From the postscript we learn that within the same year the work was partially translated into Latin, July 22, 1552, by one, Juan Badianus, a native of the district of Xuchimilco and reader in the College of Santa Cruz. Plate II. The manuscript is fittingly dedicated to Francisco de Mendoza and to his father, Antonio de Mendoza, first "Viceroy of this India" who according to the historian Mendieta, founded the college with his own funds. From the dedication also we learn that the book was intended as a gift to his "Holy Cæsarian Royal Catholic Majesty"—Charles V.

The manuscript is a complete book possessing a table of contents and is divided into thirteen chapters. As in some of the European herbals, there is an attempt to group ailments according to the region in the body, beginning with the

- Emmart E. W.—1935. Concerning the Badianus Manuscript, an Aztec Herbal, "Codex Barberini, Latin 241" (Vatican Library). Smithsonian Miscellaneous Collections, Vol. 94, No. 2, May 18, 1935.

³ Emmart E. W.—1935, "An Aztec Medical Treatise. The Badianus Manuscript." Bulletin of the Institute of the History of Medicine. Vol. 3, No. 6, June 1935.

head and proceeding to the feet In several chapters, however, this arrangement is vague The plants which are in brilliant colors¹ are usually arranged at the top of the page above the description of the usage Since the translation was made with the use of Pliny no equivalents could be found for the Aztec plant names so that these have remained unchanged along with the names of numerous stones and animals There are in fact some 313 Aztec words in the manuscript, many of which do not appear in any dictionary A complete analysis of the etymology of these words has been made and this has been of great assistance in identifying the plants botanically Aztec nouns, as in German, are built upon descriptive roots so that the analysis of the word may relate to the color of the flower or its location or perhaps to some characteristic of the plant itself such as spiney, small, large, climbing or creeping, etc

Not infrequently Aztec symbols are incorporated in the illustrations For example, a small tree called Couaxocotl² is depicted as having two serpents climbing up in the tree toward the fruit The word couaxocotl literally means serpent-fruit since coua is derived from coatl-serpent (Sim 101)³ and xocotl is the Aztec word for fruit (Sim 705) Ants are sometimes shown climbing up the stem of plants possessing nectaries or clambering over the roots of others which grow near ant hills The Aztec water symbol is frequently drawn under the roots of plants growing near running water

Among the many interesting remedies there are treatments for mange, scabs, falling hair, cataract, tumor of the eyes, cold in the head, quinsy, fever, fatigue, for helminth infections, dysentary, hemorrhoids, medicine to produce lactation and numerous other remedies The last chapter ends very fittingly with "certain signs of approaching death" Usually a page is given over to a single treatment with the principal plants illustrated at the top of the page For example, above the remedy for warts is found the plant Tzotzocaxihuitl or wart-plant (tzotzocatl-wart, Sim 670 and xihuitl-plant, Sim 699) Under the picture of the plant one reads

WART

"A warty person is healed if you apply to the warts the leaves of *helioscopium* (wartwort) ground in water, so that the warts will become putrescent and so may be lifted off It will be helpful also to rub the warts with water in which a human body has been washed" Plate III, Badianus Manuscript, page 96

For tubercles on the breast we read as follows

"The juice of ground cedar leaves and cones, of the leaves and root of *Quauhyauhtli* (wild-incense), of the herbs *Elocacatl* (maize flower), the rush, *Pocahucaliz-xuhtonli* (rare-little-plant) and *Totecyxuuh* (Herb of Totec, God of the Goldsmiths), stops a tumor growing on the breasts, if the swelling breasts be smeared with it" Plate IV, Badianus Manuscript, page 110

Many of the remedies include ingredients which have long been of medical

¹ Through the kindness of Dr Charles G Abbot of the Smithsonian Institution, colored sketches of these plants have been obtained and it is hoped that the necessary funds will some day be obtained for a complete facsimile reproduction in color with introduction and foot-notes complete

² Emmart, E W, 'An Aztec Medical Treatise The Badianus Manuscript,' Bull of the Institute of the History of Medicine, Vol 3 No 6, June 1935, page 498, Pl 5

³ Simeon Remi Dictionnaire de la Langue Nahuatl (Paris, Imprimerie Nationale, 1885)

usage Among them salt solution, a form of soil containing a large quantity of soda, onions and honey water, oil of indigo, egg white or yolk, charcoal etc Numerous unguents were used as well as plasters with a base of feathers or hair or rubber The bezoar stone, especially that from roosters, was of frequent usage Numerous stones and variously colored earths and native wines were frequently mixed with the juices of plants and frequently parts of animals Probably the earliest record in America of the use of *Datura* as a narcotic is to be found here, also the use of vanilla plant and the cocoa

That the knowledge of medical plants and treatments of disease was considered equal to if not superior to that of Europe is indicated by the fact that the early Franciscan friars included Mexican medicine in the curriculum of the College of Santa Cruz Even more significant is the fact that Philip II sent Dr Francisco Hernandez, under the title of Protomedico of Spain to New Spain with orders to travel throughout Mexico and collect data on native plants and their usage History records the fact that after the trade routes were established between the New World and Europe, roots, bark and herbs were shipped to Europe in large quantities The spreading of Aztec medical knowledge to Europe was accomplished by the writings of Friar Bernardino de Sahagun, Dr Francisco Hernandez and Dr Nicholas Monardes, and by the tales of ship captain, travelers and merchants A careful cross-referencing of the present herbal with other sixteenth century writers of Latin American botanical texts shows but little relationship except with that of Sahagun This would be expected since he resided at Tlaltelolco during a large part of his life in Mexico, and may have been at one time the teacher of Aztec and Latin to both Martinus de la Cruz and Juan Badianus

THE PHARMACIST AND THE PODIATRIST *

BY W F AMBROZ ¹

Heretofore, we as pharmacists have been detailing the doctors, the dentists, the veterinarians, the oculists, and all the while passing up the podiatrists In this field yet untouched or merely scratched, pharmacists have an opportunity to practice the principles they have learned in manufacturing and dispensing pharmacy Why not apply that knowledge and technique and in return establish a practice that will compensate for the time spent?

The podiatrist or chiropodist belongs to that branch of public health service, the same as the doctor, dentist or nurse Some practicing physicians now refer cases to the podiatrist for treatment Pharmacists, therefore, have another channel to work in a well-established and recognized field

Each state has its own rules and regulations dealing with the podiatrist Their state boards usually consist of two members of the medical state board and two practicing podiatrists They have their code of ethics or trade laws which are similar to those of the medical profession governing their practice In most states they are allowed to write prescriptions for external application Podiatry schools

* Section on Education and Legislation Portland meeting 1935

¹ Indianapolis College of Pharmacy

and colleges have three-year courses which are required by most states for state examinations. These courses envelop all phases of study that deal with foot ailment such as Anatomy, Physiology, Chemistry, Materia Medica, Pathology, Bacteriology, Surgery, Dermatology, Principles of Medicine, Diagnosis, Neurology, X-ray Therapy, Shoe Therapy, Ethics, Medical Jurisprudence, etc.

It is evident that the podiatrist is well trained in the art of caring for the feet, and can prescribe medicines to be used by his patient or will apply many of them himself. He will prescribe local applications, and it is in that connection the pharmacist should take notice.

Various coloring agents should be used with the preparations as well as essential oils for perfumes. Through the advice of the podiatrist the same preparations may be compounded by using different coloring agents and odors. The labels used on the prescriptions should bear the podiatrist's name and the name of the pharmacy.

This field is now being supplied with many proprietaries, the pharmacist can acquaint the podiatrist with many official formulas and probably some original ones which he can compound more economically to the purchaser and with greater profit for himself.

The preparations listed are limited, yet indicate a few materials the podiatrist uses. They can be compounded by pharmacists, and dispensed on prescription or otherwise.

A—DUSTING POWDERS

1	Antiseptic Powder	N F
2	Compound Powder of Talc	N F
3	Phenol	1 0 Gm
	Camphor	3 0 Gm
	Exsiccated Alum	96 0 Gm
4	Salicylic Acid	4 0 Gm

	Wool Fat	32 0 Gm
13	Lead Oleate Plaster	48 0 Gm
	Olive Oil	8 0 Gm
	Boric Acid	6 0 Gm
	Tannic Acid	2 0 Gm
	Petrolatum	36 0 Gm

C—MASSAGE PREPARATIONS

These substances are dispensed in ointment, mixture or solution form, and applied before or after treatment, usually with a vibrator

1	Witch Hazel Water	N F
2	Rubbing Alcohol	
3	Menthol	2 5 Gm
	Tragacanth	4 0 Gm
	Glycerin	12 0 cc
	Alcohol	15 0 cc
	Water q s	300 0 cc
4	Gelatin	2 0 Gm
	Water	48 0 cc
	Glycerin	5 0 cc
	Glycerite of Boroglycerin	45 0 Gm
5	Vanishing Creams	
6	Fluidextract of Hamamelis	10 0 cc
	Wool Fat	60 0 Gm
	Petrolatum	30 0 Gm
7	Menthol	0 8 Gm
	Camphor	0 8 Gm
	Eucalyptol	3 0 Gm
	Petrolatum	96 0 Gm

D—KARYOLYTICS—SOFTENING OF ABNORMAL GROWTHS

Used by the podiatrist

1	Soap Liniment	U S P
2	Liniment of Soft Soap	U S P
3	2% Aqueous Phenol Solution	
4	2% Aqueous Potassium Hydroxide Solution	

E—ESCHAROTICS

Used by the podiatrist and in some cases by the patient in the removal of corns, tumors warts etc

1	Solution of Zinc Chloride	U S P
2	Nitric Acid	U S P
3	Glacial Acetic Acid	U S P
4	Trichloroacetic Acid	U S P
5	Compound Collodion of Salicylic Acid	N F

6	Saturated Solution of Salicylic Acid in Alcohol	
7	40% Aqueous Potassium Hydroxide Solution	
8	50% Aqueous Silver Nitrate Solution	
9	Saturated Aqueous Solution of Potassium Dichromate	
10	Chromic Acid—used with enough water to form a paste	
11	Copper Sulphate in Sticks, Powder or a 15% Aqueous Solution	
12	60% Salicylic Acid Ointment	
13	Trinitrophenol	1 3 Gm
	Alcohol q s	30 0 cc

F—SKIN LESIONS

(a) *Dry, Scaly, Exfoliate*

1	Ointment of Mercuric Nitrate	N F
2	Modified Whitfield's Ointment	
3	Sulphonated Bitumen	8 0 Gm
	Glycerin	16 0 Gm
	Rose Water	16 0 cc

(b) *Ulcerated and Tender*

1	Ointment of Tannic Acid	U S P
2	Calamine Lotion	N F
3	5% Aqueous Solution of Sodium Thio sulphate	
4	Saturated Aqueous Solution of Epsom Salt	
5	Borax—as a dusting powder	
6	5% Ammoniated Mercury Ointment	
7	8% Ointment of Scarlet Red	
8	Tincture of Iodine U S P—diluted one-half with glycerin	
9	5% Gentian Violet in 50% Alcohol	
10	Acriflavine Hydrochloride 5%, in 55 parts of Alcohol 10 parts of Acetone and 35 parts of Water	
11	Saturated Aqueous Solution of Boric Acid	

(c) *With Itching*

1	Dobell's Solution	N F
2	Burow's Solution	N F diluted one to ten
3	5% Ammoniated Mercury Ointment containing 1 cc of Liquefied Phenol per 100 Gm	
4	10% Salicylic Acid Ointment	
5	Borax	8 0 Gm
	Liquefied Phenol	2 0 cc
	Glycerin	2 0 cc
	Water q s	250 0 cc

(d) *Vesicular*

1	Solution of Hydrogen Peroxide	U S P
---	-------------------------------	-------

- | | | |
|---|---|-------|
| 2 | Lassar's Zinc Paste | N F |
| 3 | Tincture of Iodine | U S P |
| | Half strength | |
| 4 | Whitfield's Ointment | |
| 5 | 10% Ointment of Ammoniated Mercury containing one drachm of Sublimed Sulphur to the ounce | |
| 6 | Saturated Solution of Salicylic Acid in Alcohol | |
| 7 | 70% Alcohol | |
| 8 | 1% Phenol Solution in 9% Alcohol and Water | |
| 9 | Mercuric Chloride 1 to 1000 | |

G—PREPARATIONS USED IN THE TREATMENT OF RING WORM INFECTIONS

- | | | |
|---|---|----------|
| 1 | Tincture of Iodine U S P diluted half with Glycerin | |
| 2 | 12.5% Aqueous Solution of Sodium Thiosulphate | |
| 3 | Mercuric Chloride 1 to 250 | |
| 4 | Mercuric Chloride | 0 18 Gm |
| | Formaldehyde | 0 42 cc |
| | Acetone | 10 00 cc |
| | Spirit of Camphor | 90 00 cc |
| 5 | Bimiodide of Mercury | 0 12 Gm |
| | Tincture of Iodine <i>q s</i> | 30 00 cc |
| 6 | Ointment of Chrysarobin | 5 0 Gm |
| | Ointment of Tar | 55 0 Gm |

H—HYPERHIDROSIS AND BROMIDROSIS

Used by the podiatrist or by the patient as directed by the podiatrist

- | | | |
|---|--------------------------|-------|
| 1 | Glycerite of Tannic Acid | U S P |
|---|--------------------------|-------|

- | | | |
|---|--|----------|
| 2 | Potassium Permanganate 1 to 1500 | |
| | Immerse feet for 5 or 10 minutes once or twice a day | |
| 3 | 4% Formaldehyde | |
| 4 | 10% Aqueous Solution of Aluminum Chloride | |
| 5 | 5% Tannic Acid Solution or 10% Ointment | |
| 6 | 5% Aqueous Solution of Alum | |
| 7 | Potassium Permanganate | 0 5 Gm |
| | Thymol | 1 0 Gm |
| | Water <i>q s</i> | 480 0 cc |
| 8 | Compound Solution of Cresol | 4 0 cc |
| | Alcohol | 96 0 cc |
| 9 | Aluminum Chloride | 10 0 Gm |
| | Alcohol | 25 0 cc |
| | Water <i>q s</i> | 100 0 cc |

I—SKIN STIMULANTS

Substances used to assist in healing

- | | | |
|---|---|---------|
| 1 | Balsam of Peru | U S P |
| 2 | 3 to 5% Solution of Salicylic Acid in Alcohol | |
| 3 | Ointment of Salicylic Acid 2% in Cold Cream | |
| 4 | Strong Silver Protein | 15 0 Gm |
| | Water | 10 0 cc |
| | Hydrous Wool Fat | 15 0 Gm |
| | Petrolatum | 60 0 Gm |
| 5 | Scarlet Red | 4 0 Gm |
| | Olive Oil | 12 0 Gm |
| | Hydrous Wool Fat | 30 0 Gm |
| | Petrolatum | 54 0 Gm |

DENTAL FORMULAS

MOUTH RINSE

- | | |
|----------------------------|-----------|
| Menthol | 0 5 Gm |
| Thymol | 0 5 Gm |
| Eucalyptol | 2 5 cc |
| Methyl Salicylate | 0 6 cc |
| Alcohol | 150 0 cc |
| Distilled Water <i>q s</i> | 1000 0 cc |

This is an aromatic mouth rinse similar to Liquor Antisepticus, but without any strongly antiseptic substances. When diluted 2-3 times, it is suitable for the spray bottle.

TOPICAL ANESTHETIC

- | | |
|---------------------|---------|
| Ethyl Aminobenzoate | 5 00 Gm |
| (Benzocaine) | |
| Camphor | 0 25 Gm |

- | | |
|-----------------|-----------|
| Menthol | 0 25 Gm |
| Oil of Clove | 0 50 cc |
| Oil of Cinnamon | 0 50 cc |
| Alcohol to make | 100 00 cc |

A few drops applied to the gum with a medicine dropper or pipette will produce surface anesthesia within 15-20 seconds. The effects persist for 10 to 15 minutes and are devoid of any subsequent irritation. Rubbing is not necessary, neither hastening nor increasing the depth of anesthesia.

Variations in flavors, such as using oils of Spearmint, Wintergreen, Peppermint, Sassafras, etc., will result in preparations according to personal tastes. The amount of Benzocaine can be increased up to 10% but should not be reduced below 3% for best results.

THE DEPARTMENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

C B JORDAN—CHAIRMAN OF EXECUTIVE COMMITTEE, A A G P, EDITOR OF THIS
DEPARTMENT

SUMMARY OF THE PROCEEDINGS OF THE 1935 MEETING

The thirty-sixth annual meeting of the American Association of Colleges of Pharmacy was held at the Multnomah Hotel, Portland, Oregon, Aug 5 and 6, 1935 Eighty-nine delegates from 38 member-colleges were in attendance Staff members from several non-member colleges in the United States and Canada were present at some of the sessions

ADDRESS OF THE PRESIDENT

President Little emphasized the necessity of colleges going forward and outlined the following procedure ' (1) Careful and conservative selection of students (2) Stressing professional training in undergraduate work (3) Adequate training and advice as to how these possibilities of professional service can best be realized following graduation, (4) Enlisting our services in promoting cooperative endeavor between physicians dentists and pharmacists, thus increasing their mutual effectiveness in behalf of public health ' He discussed the question of practical experience and urged the adoption of some policy as early as possible Graduate work should be developed in a conservative manner His recommendations were referred to the Committee on Resolutions

REPORT OF THE SECRETARY-TREASURER

Secretary Cooper reported a membership of 54 colleges with one in arrears for dues Distribution of Proceedings during the year was unusually wide The balance on hand was \$1053 08 The report was accepted and a committee appointed to audit the accounts which committee reported them correct

REPORT OF THE EXECUTIVE COMMITTEE

Chairman Jordan, of the Executive Committee, submitted the following summary of preliminary training of entering students in member-colleges

Total number entering for the year 1934-1935	2174
Number of high school graduates	2169
Number of special students	15
Number that had previous college training	600

This is an increase of nearly 10 per cent over the number entering in 1933-1934 Students with previous college training represented 27 6 per cent of the number entering Inasmuch as the 1934 meeting was in May graduates were reported for two years

COLLEGE YEAR, 1933-1934

Number receiving degrees from 3-year courses	1146
Number receiving degrees from 4-year courses	714
Total number completing 3- and 4-year courses	1860
Advanced degrees awarded	
Master of Science	27
Doctor of Philosophy	11
Honorary degrees	
Doctor of Science	1
Doctor of Philosophy	1

COLLEGE YEAR, 1934-1935

Number receiving degrees from 3-year courses	314
Number receiving degrees from 4 year courses	550
Total number completing 3 and 4 year courses (including 9 duplicates)	864
Advanced degrees awarded	
Master of Science	31
Doctor of Philosophy	8
Honorary degrees	4

Comparison of the two years cannot be made because the figures for 1934-1935 are incomplete but it is obvious that graduates are much fewer than in 1933-1934

Quoting from the report of the second series of visits to member colleges, Dean Jordan showed that there was much to be commended but he directed attention to three conditions that need correcting lack of adequate budgets, inadequate libraries and library facilities, and too heavy teaching loads

Announcement was made that the Association had been accepted as an associate society of the American Association for the Advancement of Science

The Committee recommended some minor revision of by laws, all of which were adopted

The Committee recommended that schools that had resigned from membership and that had since announced the time when they will not admit students to a course of less than four years be invited to participate in the discussions of the Association and that, if they accept the invitation, copies of the Proceedings and all official communication to member colleges be sent to them — *Adopted*

Report of the Syllabus Committee—Dean Beard reported for his Committee and expressed the hope that the three sponsoring bodies will leave to the judgment of the Committee the time of issuing the next revision — *Accepted*

Report of the Delegate to the American Council on Education—Dr Lyman reported concerning the work of the Council and that there had been an increase in membership and an increase in grants from the General Education Board for the support of the Council's work — *Accepted*

Report of the Committee on Educational Standards—Chairman Spease, of the Committee, discussed the overlapping of the work of this Committee and the Committee on Membership Standards, the reasons for requiring executive officers to be pharmacists and the advisability of requiring students to spend four years in a college of pharmacy —Report received and recommendations referred to the Committee on Resolutions

Report of the Committee on Curriculum and Teaching Methods—Dean Wilson reported that the Committee had considered some matters relative to courses in botany that had been referred to it at the 1934 meeting —Recommendations referred to the Committee on Resolutions

Report of the Committee on Relation of Boards and College —General Chairman D B R Johnson, presented a number of resolutions that had come from the districts that held meetings The report was received and at a later session the recommendations were referred to the Executive Committee

Report of the Committee on Libraries—Chairman Lee of the Committee submitted much valuable data gathered from the replies to a questionnaire —Report accepted and the recommendations referred to the Committee on Resolutions

Report of the Committee on Problems and Plans—Chairman Lyman, of the Committee, stated that the work of the year had been to get the reaction of outstanding men concerning the studies that should be undertaken first These with other suggestions by the Committee were discussed —Report accepted and the recommendations referred to the Committee on Resolutions

Report of the Committee on the Establishment of a Pharmaceutical Corps in the United States Army—In the absence of Chairman Leigh, the report was read by Vice-Chairman DuMez —Report accepted and the recommendations referred to the Committee on Resolutions

Report of the Committee on the List of Crude Drugs Prepared by District No 2—Chairman Youngken reported extensive study made by members of his Committee which included one

person from each district —Report accepted and the recommendations referred to the Committee on Resolutions

Report of the American Council on Pharmaceutical Education —Dean DuMez reported that the work of formulating standards would be started at once and assignments of work would be out shortly after schools opened —*Accepted*

REPORTS OF OTHER COMMITTEES

A number of reports that contained no recommendations were received Professor Schuck report for the Committee on Activities of Students and Alumni contained many valuable suggestions

Special committees reporting without recommendations were the following Committee on Student Branches of the AMERICAN PHARMACEUTICAL ASSOCIATION, Professor Webster, Committee on Food and Drug Legislation, Dean Jordan —*Accepted*

Though not inactive the Committee on Membership Standards had nothing ready to report

For the Committee on Code Matters, Chairman Rudd reported 'Died, buried, forgotten and the report was accepted

REPORTS OF SPECIAL REPRESENTATIVES

Dr Youngken reported on Biological Abstracts, Dr Rising for the representatives to the National Conference on Pharmaceutical Research, Professor Hayman for the representatives to the National Drug Trade Conference, Dean McCloskey as representative to the National Association of Retail Druggists —*Reports accepted*

REPORT OF THE COMMITTEE ON RESOLUTIONS

The Committee on Resolutions, consisting of Dean Wilson, *Chairman*, Professor Stuhr Professor Eby, Dean Mollett and Dean O Connell, submitted the following report

From the President's address

'1 We recommend that all matters relating to apprenticeship be referred to the Executive Committee with a request for proper consideration and report at the 1936 meeting' —*Adopted*

2 We recommend that the Committee on Curriculum and Teaching Methods be requested to compile all available material on curricula and present it at the 1936 meeting for proposal as an ideal pharmaceutical college curriculum' —*Adopted*

'3 We recommend that the matter of publishing all of the past presidential addresses be referred to the Executive Committee' —*Adopted*

"4 We recommend that the Committee on Food and Drug Legislation be continued" —*Adopted*

5 We recommend the appointment of a Committee on Professional Relations with duties as outlined by the President to consider the possibility of joint meetings of the A M A and A P H A in the future' —*Adopted*

6 We recommend the appointment of a special committee on pharmacy aptitude tests' —*Adopted*

From the report of the Committee on Curriculum and Teaching Methods

1 We recommend that the Syllabus Committee on the occasion of the next revision of the Syllabus be requested to incorporate an outline for a course in pharmaceutical botany in addition to the outline for a general course' —*Adopted*

"2 We recommend that the revision of the Syllabus in the future be on a decennial basis and contemporary with the issuance of the U S P and N F' —*Adopted*

From the Report of the Committee on Problems and Plans

'1 We recommend that the Committee on Problems and Plans with the addition of Secretary Cooper be authorized to ascertain the cost and feasibility and desirability of the publication of a quarterly journal to be known as the American Journal of Pharmaceutical Education, the report to be made at the next annual meeting' —*Adopted*

2 We recommend that Secretary Cooper be requested to write Dr H B Ward a letter of appreciation for the assistance he has rendered pharmacy as Secretary of the American Association for the Advancement of Science' —*Adopted*

From the Report of the Committee on Educational Standards

'1 We recommend that the Committee on Educational Standards and the Committee on Membership Standards be combined under the name, 'The Committee on Educational and Membership Standards' "—*Adopted*

The following recommendation, offered as a substitute for that of the Committee, was adopted

"2 We recommend that it be the sense of the Association that in case of appointments to administrative positions in colleges of pharmacy, other things being equal, preference be given to men who have had pharmaceutical training "

The recommendation having to do with the length of time that a student must spend in a college of pharmacy, which was disapproved by the Committee on Resolutions, after much discussion, was tabled Immediately thereafter a motion prevailed that the whole matter be referred to the Executive Committee for its consideration, report to be made at the 1936 meeting

From the Report of the Committee on Libraries

"We recommend that the Committee on Libraries be continued and their recommendations approved "

The recommendations referred to are

'1 That the American Association of Colleges of Pharmacy make detailed studies and reports upon the following items concerning pharmacy libraries

"(a) A minimum periodical and journal list

"(b) A minimum list of standard reference books covering the fields of pharmacy, chemistry, materia medica, etc

"(c) The qualifications of school librarians

"(d) The extent and scope of so called library courses as listed in the catalogs

"(e) The feasibility of effecting exchanges of duplicate library material for the benefit of all the libraries "

'2 That in the reappointment of this Committee it be given a tenure of at least three years "—*Adopted*

From the Report of the Committee on the List of Drugs Submitted by District No 2

"1 That the American Association of Colleges of Pharmacy is not in favor of restricting the teaching of drugs in its member colleges to any arbitrarily drafted list nor does it approve of any scheme of elimination except by extensive national survey

"2 That we recommend to the National Association of Boards of Pharmacy that the scope of examinations on drugs given by all state boards of pharmacy should embrace the U S P and N F drugs and that questions pertaining to the N N R and other unofficial products should be left to the discretion of the respective boards who are in position to determine the frequency of use and decide on the importance of the medicinals prescribed in the particular district concerned "

' In the judgment of the Committee on Resolutions the two recommendations constitute a matter for consideration in a joint meeting of the Boards and Colleges and the Committee so recommends "—*Adopted*

From the Committee on the Establishment of a Pharmaceutical Corps in the United States Army

"1 That the Committee be continued, that it be instructed to continue its efforts to effect improvement in the pharmaceutical service in the Army and to obtain the recognition therein for pharmacy of the status to which it is entitled by virtue of the traditions and the useful service which it is prepared by education and training to render

"2 That the Committee be instructed to cooperate with the Surgeon General in obtaining the passage of legislation which will bring about the substance of Recommendation No 1

If the objective as stated in No 1 cannot be attained by this procedure it is recommended

3 That the Committee be instructed to obtain the desired improvement in pharmaceutical service and its concomitant recognition in the Army by direct appeal to Congress "

As summarized by the Committee on Resolutions,

"We recommend that the Committee on the Establishment of a Pharmaceutical Corps in the United States Army be continued and instructed to use its best judgment in securing proper recognition for pharmacy in the United States Army "—*Adopted*

"The following resolution originated in the joint meeting of the Boards and Colleges

"That a committee be appointed to consider jointly with a similar committee from the N A B P the character of the examination questions given by examining boards and colleges and to present a report at a subsequent joint meeting of the Boards and the Colleges"—*Adopted*

The following resolution was offered by Dr Lyman and modified by Dean Bradley

"That we recommend to the Council of the AMERICAN PHARMACEUTICAL ASSOCIATION that our annual meeting be held either during the third or fourth week of August"—*Adopted*

The following resolution was offered by Dr Rudd

'WHEREAS, The work of the American Association of Colleges of Pharmacy has increased to such an extent that its sessions are hopelessly prolonged with committee reports and other highly important business, and

"WHEREAS More time for full discussion would make our meetings more interesting and instructive, *be it*

"*Resolved First*, that the Executive Committee use its best efforts to have all committee reports limited to not more than ten minutes, except in unusual cases, *second* that more time be arranged for discussions"—*Adopted*

PAPERS

Dr Lee and Dr DeKay presented a paper on "The Four-Year Course in Pharmacy" which brought out the changes and trends that are evident since 1929 when they made a similar study

Two papers which were directly connected with the work of the Committee on Problems and Plans were presented "Objective Tests" by Dr DeKay with sample questions on qualitative analysis and "Objectives and Achievement Tests" by Dr Klemme with sample questions on organic chemistry

A third paper "The Teaching of Bacteriology to Pharmacy Students," was presented by Dr Reddish

ANNUAL DINNER

The guest speaker at the annual dinner was Dr E H Lauer Dean of Faculties, at the University of Washington

NEW MEMBER COLLEGE

The Executive Committee recommended that the application of the Connecticut College of Pharmacy for membership be accepted The vote completed by mail since the convention, gave more than the necessary two thirds majority

OFFICERS FOR 1935-1936

President Robert C Wilson, Athens, Georgia

Vice President Homer C Washburn, Boulder, Colorado

Secretary Treasurer Zada M Cooper, Iowa City, Iowa

Chairman of Executive Committee Charles B Jordan, La Fayette, Indiana

Members of the Executive Committee (to serve two years) Ernest Little, Newark, New Jersey,

Rufus A Lyman Lincoln, Nebraska

Member of the Syllabus Committee Henry A Langenhan Seattle, Washington

JOINT SESSION

The report of the Fairchild Scholarship Committee was presented by Chairman Eberle The winner was Mr Zienty who was graduated in June from the University of Illinois College of Pharmacy

Dr Lemon presented a paper "Examination Questions Both College and Board Questions" Dr Fischels talked briefly on "The Possibilities and Limitations of Cooperation between Boards of Pharmacy and Colleges of Pharmacy"

Dean D B R Johnson read a report which included resolutions coming from various district meetings The report was received and the resolutions referred to the Committees on Resolutions of the individual bodies

CONFERENCE OF TEACHERS OF PHARMACY

The program consisted of a discussion of "Pharmaceutical Technique as Described in the Syllabus" Officers elected for the ensuing year were Dean E T Motley *Chairman*, Dean R C Wilson *Vice Chairman*, Dr C O Lee, *Secretary*

CONFERENCE OF TEACHERS OF CHEMISTRY

In the absence of Chairman Jacobs, Dr Uhl presided

Two papers were read and discussed "Instruction about Synthetics" by Dr Lynn and The Teaching of Food and Drug Analysis" by Professor Glover

Officers elected for the ensuing year were *Chairman*, Dr A H Uhl, *Secretary*, Dr Lewis C Britt

CONFERENCE OF TEACHERS OF PHARMACOGNOSY AND PHARMACOLOGY

In the absence of Chairman Schwarz, Dean Mollett presided

"Pharmacology Definition and Scope of the Course for Pharmacy Majors" was discussed by Dr Burlage and Dr Serles

A paper, "Should the Term *Materia Medica* Be Deleted from Our Catalogs and from State Board Examinations" was presented by Dean Mollett

Dr Bacon discussed "Should Undergraduate Students in Pharmacy Do Animal Experimentation or Should the Course Be Taught by Demonstrations," showing a moving picture of the pharmacology of digitalis in connection with his discussion

Biological Assays for Undergraduate Students" was discussed by Dean D B R Johnson

Correlation of Courses in Pharmacology and Physiology" was discussed by Dr Dickinson

The following papers were read by title "Pharmacology as Basis for Improving Relations with Physicians," Dr B V Christensen, "Suggestions for a Course in Botany for Pharmacy Students" Dr Bienfang, "A Study of the Records of the Same Class in Botany and Pharmacognosy," Dr Dunn, "The British Pharmacognosy Syllabus" Dr Bienfang, "The Content of a Pharmacognosy Course," Professor Fiero

Officers elected for the ensuing year were *Chairman*, Dean C E Mollett, *Secretary*, Dr Ralph Bienfang

CONFERENCE OF TEACHERS OF PHARMACEUTICAL ECONOMICS

In the absence of Chairman Olsen, Dean McCloskey presided

The following topics were discussed "Trends in Drug Store Profits, 1932, 1933, 1934," "Accounting Records Necessary and Desirable in Drug Stores," "The Operation of State Fair Trade Acts for Re sale Control"

Officers elected for the ensuing year were *Chairman*, Dean J F McCloskey, *Secretary*, Dean W H Rivard

ZADA M COOPER, *Secretary*

Approved Charles B Jordan, *Chairman*, Executive Committee

We are in receipt of a monograph on "The Leech Monopoly in Croatian Slavonica," by Prof Dr A Vrgoc (Zagreb) published in 1935, in *Apothekarskog Vjesnikas*. We thank the author

We are also indebted to Dr Antun Vrgoc for a copy of his *Pharmacognosy and Commentary on the Jugoslavian Pharmacopœia*, published in Croatian. The author has autographed the volume which contains very nearly 400 illustrations, more than 500 pages of text and includes a useful drug map of Jugoslavonica. The citation of literature covers two pages. The volume is a valuable addition to the Library and appreciation is expressed to the author

We are in receipt of a reprint from *Berichte*

of the German Pharmaceutical Society dealing with investigations of the leaves of interesting members of polypodiaceae—from the pharmaceutical Institute of the University of Basel

The Philadelphia College of Pharmacy and Science has donated a copy of "Popular Science Talks" Volume XII. The volume contains the following addresses

"The Herbs and the Stars" by Charles H LaWall, "Conquest of the Planet Earth," by George Rosengarten, "Living Light," by Arno Viehoveer, "Tooth Truths," by Ivor Griffith, "Free Air," by Arthur Osol, "Famous Finds by Pharmacists," by John Kramer. The History and Romance of Microscopy" by Louis Gershenfeld, "Silver, Metal of the World," by Clifton C Pines

UNITED STATES PHARMACOPŒIA

ABSTRACT OF PROPOSED CHANGES WITH NEW STANDARDS AND DESCRIPTIONS
ELEVENTH REVISIONCopyright 1935 by the Board of Trustees of the United States Pharmacopœial Convention *
All Rights Reserved

PART III—VOLATILE OILS

The Pharmacopœial Convention of 1930 recommended that 'abstracts of changes proposed for the U S P XI and new standards and descriptions' be published before final adoption that those who are not members of the Revision Committee may have an opportunity for comment and criticism

In compliance with this recommendation, the following abstracts are submitted The nomenclature and the exact wording does not necessarily represent that to be finally adopted Comments should be sent to the chairman of the Revision Committee

E FULLERTON COOK
43rd and Woodland Avenue,
Philadelphia Pa

Eucalyptol—The word "cooling" is added to the physical description of taste The statement regarding solubility in water is omitted

A refractive index range of 1.455 to 1.460 has been added

Eugenol—The specific gravity range has been changed to 1.066 to 1.070 at 25° C
A refractive index range of 1.540 to 1.542 has been added
The test for hydrocarbons now reads as follows

'Dissolve 1 cc of *Eugenol* in 20 cc of half-normal sodium hydroxide and add 18 cc of distilled water an immediate clear solution results (*hydrocarbons*) which may become turbid when exposed to air

Methyl Salicylate—A refractive index range of 1.535 to 1.538 has been added
The test for petroleum products has been omitted as birch oil sometimes gives positive results

The following tests have been revised or added

Five cc of *Methyl Salicylate* when shaken with 25 cc of freshly boiled and cooled distilled water requires not more than 0.45 cc of tenth normal sodium hydroxide for neutralization phenol red T S being used as the indicator (limit of free acid) '

Tests for purity A solution of one volume of *Methyl Salicylate* in two volumes of alcohol is neutral or slightly acid to moistened litmus paper

Oleum Amygdala Amara—*Assay of benzaldehyde* Add 0.1 cc of bromphenol blue indicator to 25 cc of half normal hydroxylamine hydrochloride and titrate with half normal alcoholic potassium hydroxide to the production of a greenish blue color Pour this mixture into a flask fitted with a glass stopper containing about 1 Gm of Oil of Bitter Almond, accurately weighed Shake well and then titrate with half normal alcoholic potassium hydroxide until the yellow color changes to a greenish blue Continue shaking and titrating until the greenish blue color is permanent Multiply the number of cc of half normal potassium hydroxide used by 5.3 and divide the product by the weight of oil of bitter almond taken to obtain the per cent

Oleum Anisi—The labeling requirement has been deleted A requirement is added whereby congealed oil should be melted and mixed before using The refractive index range is now 1.5530–1.5600

* Permission to reprint for purposes of comment can be had on application to the Chairman of the Board of Trustees James H Beal Fort Walton Fla

Oleum Aurantii —Change color description to read "a yellow or intense yellow or orange or deep orange liquid" The amount of oil taken for the residuc test has been reduced from 25 Gm to 10 Gm

Oleum Cadinum —"Wood" has been changed to "woody portions" in the definition The solubility test in ether has been changed to read as follows

"Almost completely soluble in Ether with not more than a slight flocculent precipitate"

The specific gravity range has been changed to "0.950 to 1.055 at 25° C"

Oleum Carvi —The only change in this test is that the strength of the sodium bisulfite solution used in adjusting the neutrality has been increased from 5 per cent to 25 per cent

Oleum Caryophylli —The only change in this text is the substitution of normal potassium hydroxide for potassium hydroxide T S

Oleum Chenopodii —The refractive index range is now 1.4723 to 1.4770 at 20° C

Oleum Cinnamomi —The word "steam distillation" is omitted in the definition Changes in the assay method have been made as under *Oleum Carvi* The refractive index range is now 1.6020 to 1.6135

Oleum Coriandri —The optical rotation has been changed to "varies from +8° to +15° in a 100 mm tube at 25° C" The refractive index range is now 1.4620 to 1.4720 at 20° C

Oleum Eucalypti —The solubility ratio in 70 per cent alcohol has been changed to read "The oil is soluble in 5 volumes of 70 per cent alcohol, by volume"

The former test for phellandrene nitrite has been replaced by the following

"Mix 2.5 cc of oil of eucalyptus with 5 cc of petroleum benzine, add 5 cc of a solution of sodium nitrite made by dissolving 5 Gm of sodium nitrite in 8 cc of distilled water, then gradually add 5 cc of glacial acetic acid No crystals of phellandrene nitrite should form within ten minutes"

The refractive index range is now "1.4580 to 1.4700 at 20° C"

Oleum Juniperi —The refractive index range is now "1.4780 to 1.4840 at 20° C"

Oleum Lavandulae —The solubility test in 70 per cent alcohol now reads "The oil is soluble in 4 volumes of 70 per cent alcohol by volume"

The refractive index range is now "1.4590 to 1.4700 at 20° C"

Oleum Limonis —The new text for oil of lemon is as follows

OLEUM LIMONIS

Oil of Lemon

Oil Limon -Lemon Oil

The volatile oil obtained by expression without the aid of heat from the fresh peel of the fruit of *Citrus medica* var *Limonum* (Risso) Hooker filius (Fam *Rutaceae*) with or without previous separation of the pulp and the peel

Description and physical properties —A pale yellow to deep yellow or greenish yellow liquid, having the characteristic odor and taste of the outer part of fresh lemon peel

Tests for identity and purity The Oil is soluble in 3 volumes of alcohol and in all proportions in dehydrated alcohol, carbon disulfide, and in glacial acetic acid

Specific gravity 0.849 to 0.855 at 25° C

Optical rotation Varies from +57° to +65.5° in a 100-mm tube at 25° C

Refractive index 1.4742 to 1.4755 at 20° C

A solution of the recently expressed Oil in alcohol (1 in 3) is neutral or only slightly acid to moistened litmus paper

Oil of Lemon when distilled as described under *Oleum Aurantii*, gives the following results The angle of rotation of the first 5 cc is not more than 5 degrees less than that of the original Oil The refractive index of this same portion is not less than 0.0010 and not more than 0.0027 lower than that of the original Oil

Preserve in completely filled, well-stoppered, amber-colored bottles, in a cool place, protected from light

Oil of Lemon which has a terebinthinate odor must not be used or dispensed

AVERAGE DOSE Metric, 0.1 cc—Apothecaries, 1½ minims

Oleum Menthae Piperita—The optical rotation range now reads "varies between 18° and 32° in a 100 mm tube at 25° C"

The following test has been added

'Mix in a dry test-tube 3 drops of Oil of Peppermint with 5 cc of a solution of 1 volume of nitric acid in 300 volumes of glacial acetic acid, and place the tube in a beaker of boiling water. In from one to five minutes a blue color develops which on continued heating, deepens and shows a copper-colored fluorescence, and then fades, leaving a golden yellow solution (distinction from oil of *mentha arvensis*)'

In drying the oily layer during the assay for total menthol anhydrous sodium sulfate has been substituted for fused calcium chloride

Oleum Menthae Viridis—The carvone requirement has been increased from 43 per cent to 50 per cent, with a corresponding change in the assay. The optical activity now reads 'varies from -48° to -59° in a 100-mm tube at 25° C'

The solubility requirement now reads "A solution of the recently distilled oil in an equal volume of 80 per cent alcohol is neutral or only slightly acid to moistened litmus paper" and

The oil is soluble in 1 volume of 80 per cent alcohol, by volume, forming a clear solution"

Oleum Myristica—The optical rotation now reads "varies from +10° to +30° in a 100 mm tube at 25° C". The refractive index range has been changed to "1.4740 to 1.4880 at 20° C"

Oleum Pini Pumilionis—The solubility test has been changed to read as follows "The oil is soluble in 4.5 to 8 volumes of 90 per cent alcohol by volume". The optical rotation requirement now reads "varies from -5° to -12° in a 100-mm tube at 25° C". The acidity test has been eliminated. It is now required that less than 10 per cent of the oil distils below 165° C.

Oleum Rosæ—This is a new text as follows

OLEUM ROSÆ

Oil of Rose

The volatile oil distilled from the fresh flowers of *Rosa gallica* L. and *Rosa damascena* Miller, and varieties of these species (Fam. *Compositæ*)

Description and physical properties A colorless or yellow liquid having the characteristic odor and taste of rose

Tests for identity and purity Oil of Rose at 25° C is a viscous liquid. Upon gradual cooling it changes to a translucent crystalline mass, which may be easily liquefied by warming.

Specific gravity 0.848 to 0.863 at 30° C compared with water at 15° C

Optical rotation varies from -1° to -4° in a 100 mm tube at 25° C

Refractive index 1.457 to 1.463 at 30° C

One cc of Oil of Rose mixes with 1 cc of chloroform without turbidity. Upon adding 20 cc of 90 per cent alcohol by volume to this solution the resulting liquid is neutral or faintly acid to moistened litmus paper and deposits a crystalline residue upon standing.

Storage—Preserve Oil of Rose in well stoppered, completely filled containers in a cool place and protected from light.

Oleum Rosmarini—The optical rotation requirement now reads "varies from -5° to +10° in a 100 mm tube at 25° C". The refractive index range is now "1.4640 to 1.4760 at 20° C".

Oleum Santali—The refractive index range is now "1.5000 to 1.5100 at 20° C, in a 100 mm tube at 25° C".

Oleum Sassafras—The optical rotation requirement now reads "varies from +2° to +4° in a 100 mm tube at 25° C".

Oleum Sinapis Volatile—The following tests have been added

"To 3 Gm of the oil, gradually add 6 Gm of sulphuric acid, meanwhile keeping the liquid cool Upon subsequent agitation the mixture will evolve sulfur dioxide, but will remain of a light yellow color, while the pungent odor of the oil will entirely disappear "

"To 3 Gm of the oil add 3 Gm of alcohol in a small flask, and then add 6 Gm of ammonia water Upon warming to 50° C , the liquid will at first become clear and will then subsequently deposit crystals of thiosinamine "

UNITED STATES PHARMACOPŒIA

ABSTRACT OF PROPOSED CHANGES WITH NEW STANDARDS AND DESCRIPTIONS ELEVENTH REVISION

Copyright 1935 by the Board of Trustees of the United States Pharmacopœial Convention *
All Rights Reserved

PART IV—EXTRACTS, FLUIDEXTRACTS AND TINCTURES—SOLUTIONS, SPIRITS AND SYRUPS— CERATES, OINTMENTS AND MISCELLANEOUS GALENICALS

The Pharmacopœial Convention of 1930 recommended that "abstracts of changes proposed for the U S P XI and new standards and descriptions" be published before final adoption, that those who are not members of the Revision Committee may have an opportunity for comment and criticism

In compliance with this recommendation, the following abstracts are submitted The nomenclature and the exact wording does not necessarily represent that to be finally adopted

Comments should be sent to the chairman of the Revision Committee

E FULLERTON COOK,
43rd and Woodland Avenue
Philadelphia, Pa

Distilled Water—Distilled water is now used in the Pharmacopœia in all formulas where water was formerly directed

EXTRACTS, FLUIDEXTRACTS AND TINCTURES

Only formulas and directions are considered here Assays are reported elsewhere

Extracta—General chapter rewritten—extracts to be evaporated at not over 60° C

Extractum Belladonnæ—Maceration of drug for 16 instead of 48 hours Evaporation under reduced pressure at not over 60° C

Extractum Felis Bovis—Oxgall evaporated to 200 cc, 500 cc alcohol added, stand 24 hours, decant, mix residue with 250 cc alcohol, filter wash filter with 250 cc alcohol Evaporate alcoholic liquids to dryness at 80° C , add starch to make the extract weigh one eighth the weight of the original Oxgall

Extractum Glycyrrhizæ Purum—Percolate is evaporated to one half its volume by boiling under atmospheric pressure and final evaporation conducted on a water-bath

Extractum Hyoscyami—Same as for *Extractum Belladonnæ*

Extractum Nucis Vomice—First menstruum consists of 750 cc alcohol, 10 cc acetic acid 240 cc water Second menstruum consists of alcohol 3 and water 1 Maceration 24 instead of 48 hours Evaporated at not over 100° C

Extractum Stramonii—Same as for *Extractum Belladonnæ*

Fluidextracta—General chapter rewritten—evaporation to be made at not over 60° C Damperened drug allowed to stand for 15 minutes instead of 6 hours

Fluidextractum Belladonnæ Radicis—Menstruum—alcohol 4, water 1

Fluidextractum Cascaræ Sagradæ Aromaticum—Formula changed to the following

Cascara Sagrada	1000	Gm
Magnesium Oxide	120	Gm

* Permission to reprint for purposes of comment can be had on application to the Chairman of the Board of Trustees James H Beal, Fort Walton, Fla

Pure Extract of Glycyrrhiza	40	Gm
Saccharin	2	Gm
Oil of Anise	0 65	cc
Oil of Coriander	0 15	cc
Methyl Salicylate	0	cc
Alcohol	200	cc
Water sufficient to make	1000	cc

Evaporated at not over 100° C

Fluidextractum Glycyrrhizæ—Ammonia water is added to the percolate which is evaporated by boiling, to 1500 cc filtered, evaporated to 750 cc and 250 cc of alcohol added

Fluidextractum Ipecacuanhæ—Menstruum, alcohol 3, water 1 Maceration 72 hours Percolate reduced, at 60° C to 1000 cc 2000 cc water added stand over night filtered, evaporated to 600 cc and 40 cc of Hydrochloric Acid and 300 cc of alcohol added

Fluidextractum Zingiberis—Official Ginger is now to be the Jamaica variety only Menstruum alcohol 9 water 1 Maceration over night

Opium Granulatum—Dried at 98° C Powder to pass through a number 16 sieve with not more than 10 per cent through a number 60 sieve

Opium Pulveratum—Dried at 98° C

Tinctura Aconiti—Menstruum alcohol 3, water 1 p_H adjusted to 3 0

Tinctura Auranti Amari—Menstruum, alcohol 2, water 1 Macerate 12 to 16 hours

Tinctura Belladonnæ—Menstruum, alcohol 3, water 1

Tinctura Cantharidis—Glacial acetic acid increased to 100 cc Macerated 4 days before percolating

Tinctura Capsici—Menstruum alcohol 9, water 1 Macerate 3 hours

Tinctura Cinchonæ Composita—Menstruum—First—Alcohol 130 cc, diluted hydrochloric acid 15 cc, water 50 cc Second—Alcohol 2 water 1 Percolate to 925 cc and add 75 cc of glycerin

Tinctura Colchici—Menstruum, alcohol 2, water 1

Tinctura Digitalis—The fat is not extracted from the drug for the new tincture Formula and directions are otherwise the same

Tinctura Gentianæ Composita—Macerate 12 to 16 hours

Tinctura Hyoscyami—Menstruum alcohol 3 water 1

Tinctura Kino—Strength raised to 20 per cent Menstruum, alcohol 9, glycerin 1

Tinctura Opii—After exhausting the drug the percolate is evaporated to 400 cc, the concentrate boiled for 15 minutes and then allowed to stand over night The next day it is heated to 80° C, the paraffin added and the heat increased until the paraffin melts The mixture is then beaten thoroughly and cooled

The paraffin is then removed the liquid filtered distilled water added to make 750 cc then 188 cc of alcohol The liquid is now assayed and sufficient menstruum added to make each 100 cc contain 1 Gm of anhydrous morphine

Tinctura Opii Camphorata—Tincture of Opium (40 cc) replaces Opium (4 Gm)

Tinctura Stramonii—Menstruum alcohol 3, water 1

Tinctura Veratri Viridis—Menstruum first alcohol 200 cc, hydrochloric acid 2 cc then alcohol, p_H adjusted between 4 and 5

SOLUTIONS SPIRITS SYRUPS

Liquor Calcii Hydroxidi—The solution is to be prepared from calcium hydroxide, 3 Gm per 1000 cc instead of calcium oxide

Liquor Ferri Tersulphatis—The formula and directions are omitted

Liquor Iodii Mitis—This is a new antiseptic for first aid treatment of wounds

LIQUOR IODII MITIS

Mild Solution of Iodine

Mild Solution of Iodine contains in each 100 cc, not less than 1 8 Gm and not more than 2 2 Gm of I and not less than 2 1 Gm and not more than 2 5 Gm of NaI

Iodine	20 Gm
Sodium Iodide	23 Gm
Diluted alcohol, a sufficient quantity, to make	1000 cc

Dissolve the iodine and sodium iodide in a sufficient quantity of diluted alcohol to make the product measure 1000 cc

Description and physical properties A transparent liquid having a reddish brown color and the odor of iodine and of alcohol

Test for identity A drop of the Solution added to 1 cc of starch T S, diluted with 10 cc of distilled water, produces a deep blue color

Assay for sodium iodide Proceed as directed for potassium iodide under *Liquor Iodæ Aquosa*

Assay for iodine Proceed as directed under *Liquor Iodæ Aquosa*

Storage Preserve Mild Solution of Iodine in glass bottles, closed with stoppers resistant to corrosion and in a cool place, protected from light

Liquor Magnesi Citratis—The formula of the U S P IX which contained 33 Gm of Citric Acid instead of the 35 Gm of the U S P X has been accepted and the following test for citric acid added

Transfer exactly 10 cc of Solution of Magnesium Citrate to a 250-cc beaker Gently agitate the contents for two minutes then dilute with 30 cc of distilled water Add 3 drops of phenolphthalein T S and normal sodium hydroxide until a permanent pink color is just produced and then acidify with 4 drops of normal hydrochloric acid Add 20 cc of calcium chloride T S and concentrate, by boiling, to about 30 cc, stirring constantly with a rubber-tipped glass rod during the boiling While hot, transfer the precipitate completely to a filter of from 9 to 11 cm in diameter with the aid of small quantities of boiling distilled water Then wash the precipitate five times with boiling distilled water Collect the filtrate and washings in a 150-cc beaker Concentrate the filtrate and washings, by boiling, to about 20 cc Add ammonia T S, drop by drop, until a distinct red color is produced and then concentrate to about 10 cc While hot transfer the precipitate completely to a filter of from 7 to 9 cm in diameter with the aid of small quantities of boiling distilled water and wash the precipitate six times with about 5 cc of boiling distilled water

Dry the two filters with the precipitates and incinerate them together in a loosely covered platinum crucible, heating at first at a low temperature until the precipitates are well charred and then removing the cover and raising the temperature until the residue is practically white If a gas flame is used it must not come in contact with the mass in the crucible Cool place the crucible with its contents in a suitable beaker, add about 30 cc of distilled water, and then exactly 50 cc of half-normal hydrochloric acid When the residue has dissolved remove the crucible rinsing it well with distilled water into the beaker Add about 100 cc of distilled water, cover the beaker with a watch glass and boil gently for about ten minutes Cool and titrate the excess of acid with half-normal sodium hydroxide, using phenolphthalein T S as the indicator Not less than 26 cc of half-normal hydrochloric acid is consumed

Liquor Potasii Arsenitis—The formula is changed to

Arsenic Trioxide	10 Gm
Potassium Bicarbonate	7.6 Gm
Alcohol	30 cc
Distilled water to make	1000 cc

The preparation is without color and is not excessively alkaline

Liquor Sodii Hypochloritis—This is a new text It is a solution containing 4 per cent of NaOCl There is no formula

Liquor Sodii Hypochloritis Chirurgicæ—The formula is changed to

Solution of Sodium Hypochlorite	1000 cc
Sodium Bicarbonate	
Distilled Water, of each, to make	6000 cc

Spiritus Anisi—The following rubric and assay have been added

Each 100 cc shall contain not less than 9 cc and not more than 11 cc of Oil of Anise

Assay Transfer exactly 5 cc of the Spirit to a Babcock flask. Attach the bottle to a suction pump and while maintaining a relatively high degree of vacuum, evaporate most of the alcohol by repeatedly but carefully immersing the bottle in hot water and immediately withdrawing it. Throughout the operation the flask must be vigorously rotated. Care must be taken that none of the liquid be drawn out of the flask. When the most of the alcohol has been removed, cool the liquid and add exactly 1 cc of kerosene from a pipette calibrated to deliver that amount and mix well. Then add sufficient saturated calcium chloride solution acidified with hydrochloric acid to almost fill the bulb of the flask. Rotate the flask vigorously to insure thorough mixing, then add sufficient of the calcium chloride solution to bring the separated oil into the neck of the flask. Centrifuge for five minutes and then read the volume of oil in the stem. Subtract 5 divisions for the kerosene added and multiply the remaining volume by 4.2 to obtain the percentage of oil, by volume, in the Spirit.

Spiritus Aurantii Compositus—The following rubric and assay have been added.

Each 100 cc shall contain not less than 25 cc and not more than 30 cc of mixed Oils.

Assay Transfer exactly 2 cc of the Spirit to a Babcock flask, add exactly 1 cc of kerosene from a pipette calibrated to deliver that amount and mix well. Then add sufficient saturated calcium chloride solution, acidified with hydrochloric acid, to almost fill the bulb of the flask. Rotate the flask vigorously to insure thorough mixing, then add sufficient of the calcium chloride solution to bring the separated oil into the neck of the flask. Centrifuge for five minutes and then read the volume of oil in the stem. Subtract 5 divisions for the kerosene added and multiply the remaining volume by 10.5 to obtain the percentage of oil, by volume, in the Spirit.

Spiritus Cinnamomi—The following rubric and assay have been added.

Each 100 cc shall contain not less than 9 cc and not more than 11 cc of Oil of Cinnamon. For the assay see *Spiritus Anisi*.

Spiritus Lavandulae—The following rubric and assay have been added.

Each 100 cc shall contain not less than 4 cc and not more than 6 cc of Oil of Lavender.

Assay Transfer exactly 10 cc of the Spirit into a Babcock flask, add exactly 1 cc of kerosene from a pipette calibrated to deliver that amount and mix well. Then add sufficient saturated calcium chloride solution acidified with hydrochloric acid, to almost fill the bulb of the flask. Rotate the flask vigorously to insure thorough mixing, then add sufficient of the calcium chloride solution to bring the separated oil into the neck of the flask. Centrifuge for five minutes and then read the volume of oil in the stem. Subtract 5 divisions for the kerosene added and multiply the remaining volume by 2.2 to obtain the percentage of oil by volume.

Spiritus Menthae Piperitae—

The leaves are macerated with 900 cc of alcohol instead of 800 cc and the oil is added after the mixture is filtered.

The following rubric and assay have been added. Each 100 cc shall contain not less than 9 cc and not more than 11 cc of Oil of Peppermint.

Assay Follow assay methods as given under *Spiritus Aurantii Compositus* except the factor for multiplying the "remaining volume" is 4.2.

Spiritus Menthae Viridis—The following rubric and assay have been added.

The leaves are macerated with 900 cc of alcohol instead of 800 cc and the oil is added after the mixture is filtered.

Each 100 cc shall contain not less than 9 cc and not more than 11 cc of Oil of Spearmint.

Assay Follow assay methods as given under *Spiritus Aurantii Compositus* except the factor for multiplying the "remaining volume" is 4.2.

Syrupus Pruni Virginianae—The drug is macerated for 1 hour, the percolation is allowed to proceed rapidly and 20 cc of alcohol is added to the preparation. An alternative method for dissolving the sugar by percolation is added.

OINTMENTS AND MISCELLANEOUS GALENICALS

Emplastrum Adhaesivum—The tension test is omitted. 100 sq cm of plaster to contain at least 1.5 Gm of plaster mass. Zinc oxide if used reduced from 20 per cent to 15 per cent.

Emplastrum Belladonnae—100 sq cm of plaster to contain at least 2.5 Gm of the belladonna plaster mass consisting of adhesive plaster and an extract of belladonna root.

Emulsum Petrolati Liquidum—This is a new text as follows.

EMULSUM PETROLATI LIQUIDI

Emulsion of Liquid Petrolatum

Emuls Petrolat Liq

Liquid Petrolatum	500	cc
Acacia, in very fine powder	125	Gm
Syrup	100	cc
Vanillin	0.035	Gm.
Alcohol	60	cc
Distilled Water, a sufficient quantity, to make	1000	cc

Mix the liquid petrolatum with the powdered acacia in a dry mortar, add 250 cc of distilled water all at once and emulsify the mixture. Then add, in divided portions and triturating after each addition, a mixture of the syrup, 50 cc of distilled water and the vanillin, dissolved in the alcohol. Finally add sufficient distilled water to make the product measure 1000 cc.

NOTE In preparing Emulsion of Liquid Petrolatum other methods of emulsification may be used and the quantity of acacia may be reduced or it may be replaced by agar, gelatin, tragacanth or mixtures of any of these emulsifying agents, provided the resulting emulsion is similar in viscosity and appearance to the emulsion made by the formula suggested above.

AVERAGE DOSE Metric, 30 cc—Apothecaries, 1 fluidounce

Emulum Olei Morrhuae—No change except that other emulsifying agents may be employed if the resulting product retains the characteristics of the emulsion prepared by the formula given.

Glycerium Acidi Tannici—Directions changed so that the tannic acid and the sodium citrate are first rubbed up with part of the glycerin, then the balance of the glycerin is added and the mixture is heated on a sand bath until solution results.

Infusa—The 50 Gm portion of drug is moistened with 50 cc of cold distilled water, in a suitable vessel, preferably earthenware, and allowed to stand for 15 minutes. Then 900 cc of boiling distilled water is poured upon it, the vessel covered, and the drug macerated for a half hour. It is then strained and distilled water added to make 1000 cc.

Linimentum Camphoræ—The following assay has been adopted.

Assay Place approximately 5 cc of Camphor Liniment in a dried and weighed 120 cc Erlenmeyer flask and weigh accurately. Connect the flask with a U-shaped drying tube, place the flask and tube in an air oven maintained at 110° C and pass a rapid stream of carbon dioxide through the U-tube into the flask for two hours. The orifice of the gas delivery tube should be about 15 mm above the surface of the Liniment. Remove the flask and Liniment, blow out the remaining carbon dioxide with dry air, cool the flask in a desiccator and weigh. The loss in weight is not less than 19 per cent and not more than 21 per cent of the weight of Camphor Liniment taken for the assay.

Linimentum Chloroformi—An assay has been added.

Assay Place 50 cc of alcohol in a 100-cc volumetric flask, and measure exactly 10 cc of Chloroform Liniment at 25° C into the flask by means of a pipette, placing the tip of the pipette just beneath the surface of the alcohol. Make up a volume of 100 cc at 25° C with alcohol and mix thoroughly. By means of the same pipette transfer 10 cc of the alcoholic solution to a hard glass test-tube of 25 mm by 200 mm internal dimensions and containing a cooled mixture of 20 cc of distilled water and 5 cc of sulfuric acid. Connect the tube by means of a tin foil-covered stopper with a well-cooled condenser, the delivery tube of which dips beneath the surface of 50 cc of an alcoholic solution of potassium hydroxide (3 in 10) contained in a 300-cc flask, and heat gently until about 10 cc of distillate has been received. Then withdraw the delivery tube, rinse it with 5 cc of alcohol, and proceed as directed in the assay under *Spiritus Chloroformi* beginning with the words 'Connect the flask by means of a tin foil-covered stopper'. Each cc of tenth normal silver nitrate is equivalent to 0.00398 Gm of CHCl₃.

Massa Hydrargyri—Honey replaces Honey of Rose.

Mistura Cretae—U S P IX formula again accepted.

Compound Chalk Powder	20	Gm
Cinnamon Water	40	cc
Water to make	100	cc

Mucilago Acaciæ—An alternative formula is added permitting it to be made extemporaneously from powdered acacia, the usual practice in prescription filling

Pilulæ Ferri Carbonatis—The use of water has been eliminated from the original mixture

Suppositoria Glycerini—The formula has been changed as follows

Glycerin	92 Gm
Sodium Stearate	8 Gm
Distilled Water	<u>5 Gm</u>
To make about	30 rectal suppositories

Heat the glycerin in a porcelain dish, on a water-bath to about 95° C, add the sodium stearate and stir the mixture gently with a glass rod, retaining the specified temperature, until the sodium stearate is dissolved. Then add the distilled water, mix thoroughly, and immediately pour the hot liquid into suitable moulds. Remove the suppositories when they are completely cold and preserve them in tightly stoppered glass containers in a cool place.

NOTE If preferred the sodium stearate for Suppositories of Glycerin may be prepared during the making of the Suppositories by the direct reaction between stearic acid and sodium carbonate or sodium hydroxide, these being taken in correct proportion.

Toxotabellæ Hydrargyri Chloridi Corrosivi—Two sizes of tablets are recognized

Small, to contain from 0.1125 to 0.1375 Gm of HgCl₂

Large, to contain from 0.45 to 0.55 Gm of HgCl₂

The tablets are to be of a distinctive color, not white, angular or irregular shape, not discolored. If for household use they are to be dispensed in glass containers of a distinctive angular shape having irregular or roughened sides or edges, red poison label on each package and also statement indicating the amount of mercury bichloride in each tablet.

Ointments—The following statement concerning Ointments is proposed for inclusion in the "Introductory Notices" of the new Pharmacopœia

"In the official ointments containing yellow or white wax or paraffin, as stiffening agents, the proportions of these and of the other fatty substances directed in the official formulas may be varied to maintain a suitable consistence under different climatic conditions, provided that the ratio of active ingredients to the total weight of the ointment remains the same and that the essential nature of the fatty vehicle is not materially changed."

Unguentum—Formula changed to

Wool Fat	5 Gm
White Wax	5 Gm
White Petrolatum	<u>90 Gm</u>
To make	100 Gm

Unguentum Acidi Borici—Formula changed and assay added

Boric Acid	10 Gm
White Wax	5 Gm
Wool Fat	5 Gm
White Petrolatum	<u>80 Gm</u>
To make	100 Gm

To contain not less than 9 per cent and not more than 11 per cent of H₂BO₃

Assay Place about 5 Gm of Boric Acid Ointment in a tared Erlenmeyer flask of suitable capacity and weigh accurately. Add about 30 cc of hot distilled water and heat for fifteen minutes on a water bath with frequent agitation. Filter while hot through a wetted filter into a 100-cc volumetric flask. Wash the flask several times with hot distilled water transferring the washings to the filter. When cool dilute the filtrate to exactly 100 cc. To exactly 20 cc of the filtrate, representing one-fifth of the weight of Boric Acid Ointment taken, add 20 cc of glycerin, previously neutralized to phenolphthalein T.S. Titrate with tenth normal sodium hydroxide using phenolphthalein T.S. as the indicator. Discharge the pink color by the addition

of 20 cc of glycerin, neutral to phenolphthalein T S and again titrate until the pink color reappears Each cc of tenth normal sodium hydroxide is equivalent to 0.006192 Gm of H_3BO_3

Unguentum Acidi Tannici —Formula changed to

Tannic Acid	20 Gm
Glycerin	20 Gm
Wool Fat	3 Gm
Yellow Wax	3 Gm
Petrolatum	74 Gm
To make	100 Gm

Unguentum Aqua Rosæ —The stronger rose water is replaced with 50 cc of rose water, 140 cc of distilled water and 0.2 cc of oil of rose The ointment is to be preserved in pure tin collapsible tubes

Unguentum Belladonnae —Formula changed to

Pilular Extract of Belladonna	10 Gm
Diluted Alcohol	5 cc
Wool Fat	5 Gm
Yellow Wax	5 Gm
Petrolatum	75 Gm
To make	100 Gm

A new rubric and assay appear elsewhere

Unguentum Chrysarobini —Formula changed to

Chrysarobin	6 Gm
Wool Fat	5 Gm
Yellow Wax	5 Gm
Chloroform	4 Gm
Liquid Petrolatum	6 Gm
Petrolatum	74 Gm
To make	100 Gm

Unguentum Gallæ —Formula changed to

Nutgall	20 Gm
Yellow Wax	5 Gm
Wool Fat	5 Gm
Petrolatum	70 Gm
To make	100 Gm

Unguentum Hydrargyri Ammoniaci —Formula changed and assay added

Ammoniated Mercury	10 Gm
White Wax	5 Gm
Wool Fat	5 Gm
White Petrolatum	80 Gm
To make	100 Gm

Ammoniated Mercury Ointment contains an amount of ammoniated Mercury corresponding to not less than 7.1 per cent and not more than 8.7 per cent of Hg

Assay Place in a separator about 1.5 Gm of Ammoniated Mercury Ointment accurately weighed Warm it slightly to soften the ointment and while rotating add 50 cc of ether and then shake the mixture until the ointment base is dissolved Add 10 cc of a mixture of equal volumes of hydrochloric acid and distilled water and shake it vigorously until all of the Ammoniated Mercury has dissolved Filter the aqueous layer that separates into a 250-cc beaker and wash the remaining ethereal solution with several portions of 10 cc each of distilled water until the washings produce no turbidity with silver nitrate T S

Dilute the hydrochloric acid solution and the combined washings to about 150 cc and add 5 cc of hydrochloric acid. Saturate the solution with hydrogen sulfide gas and collect the precipitate in a tared Gooch crucible. Wash the precipitate successively with distilled water with two 10-cc portions of alcohol, two 10 cc portions of carbon tetrachloride, using no suction and finally wash with 10 cc of ether. Dry the crucible and contents to constant weight at 100° C. The weight of mercuric sulfide obtained, multiplied by 0.862 indicates the quantity of mercury represented by the ammoniated mercury in the Ointment taken for the assay.

Unguentum Hydrargyri Fortius —Formula changed

Mercury	500 Gm
Oleate of Mercury	20 Gm
Wool Fat	300 Gm
White Wax	50 Gm
Petrolatum	130 Gm
To make	1000 Gm

Unguentum Hydrargyri Mite —Formula changed to

Strong Mercurial Ointment	600 Gm
White Petrolatum	380 Gm
White Wax	20 Gm
To make	1000 Gm

Unguentum Hydrargyri Oxidi Flav —Formula changed and assay added

Yellow Mercuric Oxide	1 Gm
Liquid Petrolatum	1 Gm
Yellow Wax	5 Gm
Wool Fat	5 Gm
Petrolatum	88 Gm
To make	100 Gm

Yellow Mercuric Oxide Ointment contains not less than 0.9 per cent and not more than 1.1 per cent of HgO.

Assay Place in a separator about 10 Gm of Ointment of Yellow Mercuric Oxide accurately weighed. Warm it slightly to soften the ointment and while rotating add 50 cc of ether. Shake the mixture until the soluble portion is dissolved. Add 10 cc of a mixture of equal volumes of hydrochloric acid and distilled water and shake it vigorously until the mercuric oxide has dissolved. Filter the aqueous layer that separates into a 250 cc beaker and wash the remaining ethereal solution with several portions of 10 cc each of distilled water until the washings produce no turbidity with silver nitrate T.S. Dilute the hydrochloric acid solution and the combined washings with distilled water to about 150 cc and add 5 cc of hydrochloric acid. Saturate the solution with hydrogen sulfide gas and collect the precipitate in a tared Gooch crucible. Wash the precipitate successively with distilled water, two 10 cc portions of alcohol, two 10 cc portions of carbon tetrachloride without suction and finally with 10 cc of ether. Dry the crucible and contents to constant weight at 100° C. The weight of mercuric sulfide obtained, multiplied by 0.931 indicates the quantity of mercuric oxide in the Ointment taken for the assay.

Unguentum Iodi —Formula changed and assay added

Wool Fat changed to	5 Gm
Yellow Wax	5 Gm added
Petrolatum	70 Gm added

Iodine Ointment contains not less than 6.5 per cent and not more than 7.5 per cent of total I.

Assay Tare a nickel or silver crucible containing about 2 Gm of anhydrous potassium carbonate, add about 1 Gm of Iodine Ointment and reweigh. Cover the Ointment with an additional 2 Gm of potassium carbonate and heat on a water bath until the Ointment is fluid. Heat the crucible and contents gently over a Bunsen flame gradually increasing the temperature.

but not exceeding a dull redness, until the Ointment is completely carbonized. Extract the residue with boiling distilled water and wash on a filter until the washings no longer produce a precipitate with silver nitrate T S after acidifying with nitric acid. Heat the combined filtrate and washings, which measure about 75 cc, on a water-bath, and add potassium permanganate T S until the hot liquid remains permanently pink. Add just enough alcohol to remove the pink tint, cool to 25° C, then add sufficient distilled water to make exactly 100 cc. Filter the mixture through a filter which has not been previously moistened, rejecting the first 25 cc of filtrate. To 50 cc of the subsequent clear filtrate add 10 cc sodium potassium iodide T S, acidify with diluted sulfuric acid and titrate with tenth normal sodium thiosulfate. Each cc of tenth-normal sodium thiosulfate is equivalent to 0.002115 Gm of iodine.

Unguentum Phenolis —Assay added

Phenol Ointment contains not less than 1.8 per cent and not more than 2.2 per cent of C_6H_5OH .

Assay Place about 2 Gm of Phenol Ointment in a tared 150 cc Florence flask and weigh accurately. Add 75 cc of distilled water and arrange the flask for steam distillation having connected it with a water chilled condenser. Distil with steam, collecting 150 cc of distillate in a 500-cc glass stoppered flask. 1 cc of the subsequent distillate should show no turbidity with 3 cc of bromine T S. Add exactly 50 cc of tenth-normal bromine and proceed with the assay as directed under *Phenol*, line beginning with the words 'then 5 cc'. Each cc of tenth normal bromine is equivalent to 0.001568 Gm of C_6H_5OH .

Unguentum Sulphuris —Formula changed and assay added

Precipitated Sulfur	15 Gm
Wool Fat	5 Gm
Yellow Wax	5 Gm
White Petrolatum	75 Gm
To make	100 Gm

Sulfur Ointment contains not less than 13.5 and not more than 16.5 per cent of S.

Assay Place about 0.5 Gm of Sulfur Ointment in a tared Erlenmeyer flask of suitable capacity and weigh accurately. Add 5 cc of nitric acid and 3 cc of bromine. Heat the mixture gently until the excess of bromine has been dissipated. Add about 50 cc of distilled water and transfer to a separator. Extract the liquid with three successive portions of ether of 30, 20 and 10 cc respectively, to remove the soluble ingredients. Wash the combined ethereal washings with about 10 cc of distilled water and add this to the aqueous solution. Dilute the solution to about 200 cc with distilled water and acidify with hydrochloric acid. Heat the mixture to boiling and add hot barium chloride T S in small portions, until no further precipitation takes place. Heat the mixture on a water-bath for thirty minutes, collect the precipitate on a filter wash, dry, ignite and weigh it as barium sulfate. The weight of barium sulfate thus obtained multiplied by 0.1373, indicates its equivalent of S.

Unguentum Zinc Oxidi —Formula changed and assay added

Zinc Oxide	20 Gm
Liquid Petrolatum	10 Gm
White Wax	5 Gm
Wool Fat	5 Gm
White Petrolatum	60 Gm
To make	100 Gm

Zinc Oxide Ointment contains not less than 19 per cent and not more than 21 per cent of ZnO.

Assay Weigh accurately in a tared porcelain dish about 2 Gm of Zinc Oxide Ointment, heat it slowly until melted and continue the heating, gradually raising the temperature until the mass is thoroughly charred. Cool, break up the charred mass with a stout glass rod, add 10 cc of distilled water and 5 cc hydrochloric acid and heat on the water-bath for one-half hour. Filter and wash the filter thoroughly with distilled water. Dilute the filtrate to 150 cc, add ammonia T S until the precipitate first formed is redissolved and then pass hydrogen sulfide through the

mixture until the zinc is completely precipitated. After allowing it to stand for about one hour filter the precipitated zinc sulfide and wash it a few times with water containing a little ammonium sulfide. Dissolve the precipitate of zinc sulfide from the filter by pouring over the edges of the filter hot diluted hydrochloric acid in small portions at a time. Wash the filter thoroughly with small quantities of hot distilled water, receiving the filtrate and washings in a tared porcelain dish. Evaporate the filtrate on the water-bath to about 2 cc then add to it 3 Gm of yellow mercuric oxide, previously mixed with about 15 cc of distilled water. Evaporate the mixture to dryness and carefully ignite the residue under a hood to constant weight. The weight of the zinc oxide thus obtained, corrected for any non-volatile matter contained in 3 Gm of the mercuric oxide corresponds to not less than 19 per cent and to not more than 21 per cent of the weight of the Ointment taken for the assay.

REPORT ON THE UNITED STATES PHARMACOPŒIA ELEVENTH REVISION *

BY E FULLERTON COOK CHAIRMAN OF THE U S PHARMACOPŒIA COMMITTEE ELEVENTH REVISION

The work of revision upon the U S P XI of necessity must soon come to a conclusion if the new Pharmacopœia is to appear within a reasonable time. The galley proofs, after an exacting review by the members of the Revision Committee, and the insertion of many alterations, have been sent back to the printer for issuance as page proof. While it will be necessary to make a few additional changes, these cannot be of a drastic character, since page proof, when once made up does not permit of extensive revision.

This means that admissions and deletions are settled for this printing, although the Convention has authorized the admission of new titles, should this prove desirable, through the issuance of "Supplements."

The question of "Scope" always will be one of the major problems of the Revision. Members of the Sub-Committee responsible for these decisions have most earnestly and conscientiously studied this problem. Their deliberations cover about 500 pages of Bulletins, and, in a number of instances, they have called for information and advice from the Sub-Committee on Therapeutics, in which Committee's Bulletins will be found many more pages of discussion.

The Sub-Committee on Scope has proceeded on well-defined principles. Its objective has been, to include as official in the Pharmacopœia, a comprehensive and dependable list of therapeutic agents meeting most of the needs of the medical profession. Insulin will be a striking example of omission, for, though approved, it could not be admitted due to its control by patent. As soon as this expires it will promptly be admitted by the Supplement route.

The newly admitted substances are as follows

ARTICLES ADDED TO THE U S P XI

Acriflavina	Ephedrina
Acriflavinae Hydrochloridum	Ephedrinae Hydrochloridum
Æthylenum	Ephedrinae Sulfas
Æthylhydrocuprinae Hydrochloridum	Erythrol Tetranitrat
Æthylis Oxidum	Extractum Hepatis
Antitoxinum Scarlatinae Streptococcicum	Ferri et Ammoni Citrates Virides
Bismuthi et Potassii Tartras	Fluoresceinum Solubile
Calci Creosotas	Histaminæ Phosphas
Calci Gluconas	Hydrargyri Succinimidum
Calci Hydroxidum	Iodophthalenum Solubile
Carbo Activatus	Liquor Ergosterolis Irradiati
Carboni Dioxidum	Liquor Hepatis
Chlorobutanol	Liquor Hepatis Purificatus
Digitalis Pulverata	Liquor Histaminæ Phosphatis
Emulsum Petrolati Liquidum	Liquor Parathyroides

* Read at the 1935 A. P. H. A. meeting Portland Oregon

Liquor Sodii Hypochloritis
 Merbaphenum
 Neocinchophenum
 Oleum Iodatum
 Oleum Maydis
 Oleum Morrhuæ Non Destearinatum
 Oleum Rosæ
 Phenacinae Hydrochloridum
 Phenobarbitalum Solubile
 Pulvis Chimofom
 Serum Antimeningococcicum
 Serum Antipneumococcicum
 Soda Perboras
 Soda Stearas

Stomachus
 Tabellæ Glycerylis Trinitratis
 Theophyllina cum Æthylenediamina
 Theophyllina et Sodii Acetas
 Tinctura Iodi Mitis
 Toximum Diphthericum Detoxificatum
 Toximum Diphthericum Diagnosticum
 Toximum Scarlatinae Streptococcicum
 Toxicitabellæ Hydrargyri Bichloridi Parvæ
 Tryparsamidum
 Tuberculinum Pristinum
 Vaccinum Rabies
 Vaccinum Typhosum
 Vaccinum Typhosum Paratyphosum

Interim Revisions—There has been an increasing recognition within the past few years that decennial revisions were not adequate for official standards, that the U S P policy of a ten-year change in the official requirements and scope greatly lessened the usefulness of the Pharmacopœia, and, in fact, established some standards which soon became inaccurate or incapable of enforcement due to advances in scientific knowledge

This was strikingly true of products standardized by biological methods in which field tremendous strides were being made, but other influences such as new legislation, increased Governmental enforcement, and the introduction of new therapeutic agents all combined to force the issuance of supplements which became known as "Interim Revision Announcements"

There can be little doubt that if the Pharmacopœia of the future is adequately to serve the medical and pharmaceutical professions and to provide correct standards for governmental enforcement, that this policy will have to be continued and perhaps extended. One suggestion has been the issuance of an "annual supplement" but only time can determine the form which added titles and revised standards shall take to most effectively meet the changing and developing need for standards in medicinal products

Fortunately the authority has been provided and the Revision Committee was prepared to meet the unusual situations of the past two years and thus prove that the revision machinery was sufficiently flexible and fully qualified to meet these new problems as they have arisen

Vitamin and Anti anemia Advisory Boards—Among recent problems has been the necessity for the Pharmacopœia to assist in establishing standards for important new medicinal products. Here again the unique position of the Pharmacopœia has been demonstrated

In the field of vitamins, the Committee by investigation has been able to bring into conference outstanding specialists in this field. The group includes those dealing with the subject as a pure science, mostly in University or Scientific Research, then the experts in Government laboratories, and, in addition, the technical experts associated with commercial organizations

This group, coming together under Pharmacopœial auspices, sitting about one table with their discussions reported in full and published, made it possible to establish a balanced judgment, eliminate special interests and reach wise decisions which ultimately were reflected in new U S P standards for Cod Liver Oil

To direct this program, the U S P Vitamin Advisory Board has been established, having as members Doctors Mendel Sherman and Nelson and a representative of the U S P Board of Trustees and of the Committee of Revision. This Board is now directing an extensive study, with 26 laboratories participating, into methods of assaying vitamin B₁. A recent necessity for pharmacopœial standardization has been the newly admitted preparations for the treatment of pernicious anemia. To meet this need a new Board of experts in this field is being established. This Board will announce methods of assay and will evaluate clinical reports upon products which have been given official recognition

Reference Standards—It has become necessary for pharmacopœial authorities to establish and distribute certain reference standards for use as a basis of comparison in assays. This becomes a new function for the Pharmacopœia, although a similar service was rendered by the Food and Drug Administration during the past decade

mixture until the zinc is completely precipitated. After allowing it to stand for about one hour, filter the precipitated zinc sulfide and wash it a few times with water containing a little ammonium sulfide. Dissolve the precipitate of zinc sulfide from the filter by pouring over the edges of the filter hot diluted hydrochloric acid in small portions at a time. Wash the filter thoroughly with small quantities of hot distilled water, receiving the filtrate and washings in a tared porcelain dish. Evaporate the filtrate on the water-bath to about 2 cc then add to it 3 Gm of yellow mercuric oxide, previously mixed with about 15 cc of distilled water. Evaporate the mixture to dryness and carefully ignite the residue under a hood to constant weight. The weight of the zinc oxide thus obtained, corrected for any non-volatile matter contained in 3 Gm of the mercuric oxide corresponds to not less than 19 per cent and to not more than 21 per cent of the weight of the Ointment taken for the assay

REPORT ON THE UNITED STATES PHARMACOPŒIA ELEVENTH REVISION *

BY E. FULLERTON COOK, CHAIRMAN OF THE U. S. PHARMACOPŒIA COMMITTEE, ELEVENTH REVISION

The work of revision upon the U. S. P. XI of necessity must soon come to a conclusion if the new Pharmacopœia is to appear within a reasonable time. The galley proofs, after an exacting review by the members of the Revision Committee, and the insertion of many alterations, have been sent back to the printer for issuance as page proof. While it will be necessary to make a few additional changes, these cannot be of a drastic character, since page proof, when once made up does not permit of extensive revision.

This means that admissions and deletions are settled for this printing, although the Convention has authorized the admission of new titles, should this prove desirable, through the issuance of 'Supplements.'

The question of "Scope" always will be one of the major problems of the Revision. Interim Revisions —There has been an increasing recognition within the past few years that decennial revisions were not adequate for official standards, that the U S P policy of a ten-year change in the official requirements and scope greatly lessened the usefulness of the Pharmacopœia, and in fact, established some standards which soon became inaccurate or incapable of enforcement due to advances in scientific knowledge.

This was strikingly true of products standardized by biological methods in which field tremendous strides were being made, but other influences such as new legislation, increased Governmental enforcement, and the introduction of new therapeutic agents all combined to force the issuance of supplements which became known as "Interim Revision Announcements."

There can be little doubt that if the Pharmacopœia of the future is adequately to serve the medical and pharmaceutical professions and to provide correct standards for governmental enforcement, that this policy will have to be continued and perhaps extended. One suggestion has been the issuance of an "annual supplement" but only time can determine the form which added titles and revised standards shall take to most effectively meet the changing and developing need for standards in medicinal products.

Fortunately the authority has been provided and the Revision Committee was prepared to meet the unusual situations of the past two years and thus prove that the revision machinery was sufficiently flexible and fully qualified to meet these new problems as they have arisen.

Vitamin and Anti-anemia Advisory Boards —Among recent problems has been the necessity for the Pharmacopœia to assist in establishing standards for important new medicinal products. Here again the unique position of the Pharmacopœia has been demonstrated.

In the field of vitamins, the Committee by investigation has been able to bring into conference outstanding specialists in this field. The group includes those dealing with the subject as a pure science, mostly in University or Scientific Research, then the experts in Government laboratories and, in addition, the technical experts associated with commercial organizations.

This group, coming together under Pharmacopœial auspices, sitting about one table with their discussions reported in full and published, made it possible to establish a balanced judgment eliminate special interests and reach wise decisions which ultimately were reflected in new U S P standards for Cod Liver Oil.

To direct this program, the U S P Vitamin Advisory Board has been established having as members Doctors Mendel, Sherman and Nelson and a representative of the U S P Board of Trustees and of the Committee of Revision. This Board is now directing an extensive study with 26 laboratories participating, into methods of assaying vitamin B₁. A recent necessity for pharmacopœial standardization has been the newly admitted preparations for the treatment of pernicious anemia. To meet this need a new Board of experts in this field is being established. This Board will announce methods of assay and will evaluate clinical reports upon products which have been given official recognition.

Reference Standards —It has become necessary for pharmacopœial authorities to establish and distribute certain reference standards for use as a basis of comparison in assays. Thus becomes a new function for the Pharmacopœia, although a similar service was rendered by the Food and Drug Administration during the past decade.

Among the reference standards will be the "Reference Cod Liver Oil" of known vitamin A and vitamin D potency, expressed in U S P vitamin units, a "Reference Digitalis Powder" of known activity, expressed in terms of U S P digitalis units, a "Reference Pepsin," having a proteolytic activity equivalent to 3000 times its weight of egg albumen, also the standard for Ergot, Ergotoxine Ethanesulfonate and perhaps several others

Digitalis—As already indicated, the potency of this drug and the two official preparations, the "Standardized Powder" and the "Tincture," will be expressed in terms of U S P digitalis units. This U S P unit is identical in potency with the International Digitalis Unit which is the activity of 0.1 Gm. of the International Standard Digitalis Powder. The potency of the official digitalis leaf shall be such that 0.1 Gm. shall possess an activity equivalent to not less than 1 U S P digitalis unit.

Under the title for this drug will be found the statement "When digitalis is prescribed, 'Digitalis Pulverata' is to be dispensed." Under the title "Digitalis Pulverata" or "Powdered Digitalis" it is required that 0.1 Gm. shall possess an activity equivalent to not less than 1 and not more than 1.1 U S P digitalis units when assayed as directed under the Tincture.

In the Tincture of Digitalis the potency of 1 cc. is to be the equivalent of not less than 1 and not more than 1.1 U S P digitalis units, in other words one-tenth of the strength of the powdered drug. And here will be found the details of the assay which retains the one hour frog method. While a 10 per cent range of potency is indicated in the statement of standards, in both the powder and the tincture, at the end of the assay a tolerance is provided which states that owing to many variable factors in the assay which makes it difficult for different operators to obtain identical results evidences of potency within 20 per cent above or 20 per cent below the standard are accepted.

The frog method of assay has been retained, since the Sub Committee was not convinced of the superiority of any other method. An extensive investigation has been started, however with clinical cooperation and to be participated in by the British Pharmacopœial Commission in which a number of methods of assay will be compared on preparations distributed by the pharmacopœial committee and the investigation will include a comparison of the various assay methods and clinical results from the use of digitalis preparations which have been aged. When this study is completed it is expected that we shall have reliable evidence on many of the controversial points in digitalis assay.

Ergot—Here again uncertainty prevails, notwithstanding the recent extensive studies concerning ergot constituents. Apparently no better assay than the cockscorn method for determining the fact that the Fluidextract is potent has been presented at least the present state of knowledge is such that the question is still in flux. The Fluidextract, however, is to be prepared from drug of prime quality by the Type C Method, without heat, and 1000 cc. is to be made from 1000 Gm. of drug. There is to be no subsequent adjustment of volume but the product must have a known minimum potency, per cubic centimeter, equivalent to that of not less than 0.5 mg. of ergotoxine ethanesulfonate—but no upper limit.

Should a Fluidextract fail to meet this standard it would indicate a product which was not official even though it could be shown to possess some potency by another type of assay but which probably evaluated a different constituent.

Sulfur vs. Sulphur—Sulfur' or words derived from sulfur, such as sulfite, sulfate, thio sulfate, etc., all will be spelled with an 'f' in place of the 'ph' in the new Pharmacopœia.

Tincture of Ginger—Only recently it has been found practically necessary to omit Tincture of Ginger from the Pharmacopœia. This is due to the action by the Internal Revenue Bureau which places it in the same status as alcoholic liquors. As now regulated, this tincture can be prepared only by one holding a permit to make it and having a rectifier's license. It could then be sold and kept only in the original container which had the license number of the rectifier blown in the glass of the bottle.

Inasmuch as no rectifier has taken out a license to manufacture it, there is no legal Tincture of Ginger available to-day in the United States. Anyone having it in stock or making it by the official method is subject to severe penalties.

The Fluidextract will be retained and is directed in the formula for Aromatic Sulfuric Acid and will be available for therapeutic use when needed.

Distilled Water—Distilled Water' has replaced "Water" in the formulas of the Pharma

copœia This is in conformity with the practice of practically all pharmacopœias of the world and was adopted only after a wide survey of the water supplies in many parts of the country indicated that the available water in many communities was unfit for use in medicinal products. This fact, of course, had been generally recognized and careful pharmacists and manufacturing pharmacists have long been using nothing but distilled water in medicinal solutions and preparations.

Activated Charcoal—U S P X Wood Charcoal is being replaced by an "Activated Charcoal" which is required by test to have adsorbent qualities of a high order to insure superior therapeutic efficiency. By one test a methylene blue solution must be decolorized by another test strychnine sulfate is adsorbed from solution while by a third test hydrogen sulfide gas is adsorbed. The U S P will state that when Carbo Ligni is prescribed Carbo Activatus may be dispensed.

Solution of Potassium Arsenite—Fowler's Solution has been modified so as to have only a slight alkalinity and the Compound Tincture of Lavender has been replaced by alcohol, thus making a colorless solution. This simplification of the formula is in harmony with scientific improvement. The old solution was simply an imitation of one of the oldest known proprietary medicines. The pharmacist and the doctor must, however, know of changes of this type as soon as possible.

Solution of Sodium Hypochlorite (4 Per Cent)—This solution has replaced Chlorinated Lime in the preparation of Dakin's Solution and also can be used advantageously as a disinfectant and deodorant in those cases where chlorinated lime was formerly employed.

A solution of this type is now widely used in the home and is readily available at small cost but usually under a trade marked name. It should now be made available under the official title.

Solution of Magnesium Citrate—The U S P IX formula has been adopted with 33 Gm of citric acid instead of 35 Gm. This reduction in acid is satisfactory when the Magnesium Carbonate used does not contain the equivalent of Magnesium Oxide in the maximum amount permitted. In fact, precipitation on long standing will occur unless the oxide equivalent is controlled at the lower limit. A note is introduced suggesting that for greater stability the amount of Magnesium Carbonate taken shall be the equivalent of 15 Gm of 39.2 per cent oxide. If the oxide equivalent of the carbonate is stated on the package, this adjustment is readily possible. Sterilization is also suggested as a means of improving the stability of the solution.

Variations Permitted—The new Pharmacopœia will specifically authorize variations in a few products. A blanket clause provides for the increase or decrease in the degree of consistency in ointments, but without altering the character or percentage of medication or the nature of the fatty vehicle. This is to meet varying climatic conditions.

In the Emulsions of Cod Liver Oil and of Liquid Petrolatum, other emulsifying agents are permitted provided the general character of the finished product is not changed.

In some cases as under Syrup of Ferrous Iodide, where there are standards, tests and assay, a formula is given but this is preceded by a statement, such as, "Syrup of Ferrous Iodide may be prepared by the following formula." This is in harmony with the principle that when adequate tests are provided for chemical substances, the chemical process may be varied if the resulting products are identical.

Color Standards—The permissible intensity of color in Cod Liver Oil and the degree of color permitted under many chemicals when subjected to the action of sulfuric acid, are now controlled by comparison with color standards. These color standards are those proposed by Professor Army and his associates many years ago and the various "matching fluids," as they are officially termed, are prepared by mixing specific proportions of standard colorimetric solutions of cobaltous chloride, ferric chloride and cupric sulfate. This is an important advance and removes the uncertainty of meaning always introduced by descriptive color terms for which there is no color standard.

Reagents—It will be of interest to chemists to know that the Pharmacopœia has elaborated many of the texts for reagents bringing them in most instances into harmony with standards established by the American Chemical Society.

Coöperation—The spirit of cooperation and the enormous amount of time consuming labor from members of the Revision Committee and also from volunteers is perhaps unparalleled in work of a similar character elsewhere.

It is this interest from members of the pharmaceutical and medical professions which makes possible so unique a program as that which established our Pharmacopœia and which now main-

tains its prestige among similar publications. The unselfish and scientific character of pharmacopœial work must be maintained if Pharmacy is to merit this rich heritage, and our generation must look well to the spirit with which we approach the forthcoming Pharmacopœial Convention. The eyes of the coöperating scientific world are upon us and we who love our profession must zealously guard the essential standards.

With the limited time allotted for this presentation it is possible to touch only a few outstanding features of the revision. Detailed changes, in abstract, in many departments are being published in the A. P. H. A. JOURNAL during the next two months and will provide an opportunity for many to obtain information concerning the changes.

THE TESTS FOR REDISTILLED WATER IN THE NATIONAL FORMULARY VI MONOGRAPH *

BY R. S. ADAMSON, R. K. SNYDER, E. N. GATHERCOAL

The tests in the N. F. VI monograph for redistilled water are as follows:

Tests for Purity—Evaporate 100 cc. of Redistilled Water to dryness on a water bath, and subsequently dry the residue in an oven to constant weight at 100° C. not more than 0.0005 Gm. of residue remains.

Separate portions of 10 cc. each of Redistilled Water are not affected by the addition of barium chloride T. S. (*sulfate*), silver nitrate T. S. (*chloride*), ammonium oxalate T. S. (*calcium*), hydrogen sulfide T. S. (*metals*).

Redistilled Water shows not more than a faint yellow color when 0.1 cc. of alkaline mercuric potassium iodide T. S. is added to a 100-cc. portion (*ammonia*).

Add 10 cc. of calcium hydroxide T. S. to 5 cc. of Redistilled Water. The mixture remains clear and transparent (*carbon dioxide*).

Heat 100 cc. of Redistilled Water to boiling, acidulate with 10 cc. of diluted sulfuric acid and subsequently add 0.1 cc. of twentieth normal potassium permanganate. The color of the liquid is not completely destroyed by boiling for 10 minutes (*oxidizable substances*).

Test for Sterility—Follow the general methods given on pages 24 to 26 for the Testing of Ampul Solutions for Sterility. If the sample to be examined is in a bulk package, follow Section D. Plant 10 fermentation tubes with 1 cc. of the sample in each. If growth appears in any of the fermentation tubes, the test may be repeated. If growth appears in any of the second lot of fermentation tubes, the water in the bulk package shall not be used in any product intended for parenteral use. If the sample to be examined is taken from ampuls, follow Section E. If growth appears in any of the fermentation tubes planted, the test may be repeated. If growth appears in any of the second lot of fermentation tubes planted, the whole lot of ampuls shall be discarded.

QUANTITY OF WATER REQUIRED FOR THE TESTS

Considerable objection has been raised to the use of a large quantity of Redistilled Water (when in ampuls) for making the tests for purity. In U. S. P. X, about 725 cc. of distilled water is required to make the purity tests. Therefore, in the redistilled water monograph, the 100 cc. quantities have been reduced to 10 cc. for the tests for *sulfate*, *chloride*, *calcium* and *metals*, and a 5-cc. quantity for *carbon dioxide*. The 100-cc. quantities are retained for determining the *residue*, *oxidizable impurities* and *ammonia*. This requires a total of 345 cc. of redistilled water.

THE TESTS FOR SALTS

A solution was prepared as follows:

Sodium Chloride	1.0 Gm
Sodium Sulfate anhydrous	1.0 Gm
Calcium Oxide	5.0 Gm

* Scientific Section A. P. H. A. Portland meeting, 1935.

Iron Nitrate	2 0 Gm
Copper Acetate	1 0 Gm
Stronger Ammonia Water	3 5 cc
Acetic Acid,	
Doubled Distilled water, each a sufficient quantity	
To make	1000 0 cc

Dissolve the salts and the oxide in 750 cc of the doubled distilled water with the aid of a little acetic acid, add the stronger ammonia water and then sufficient acetic acid to make slightly acid. Filter, and add enough of the double distilled water through the filter to make 1000 cc

Dilute 100 cc of the solution with double-distilled water to make 1000 cc and mix well

Dilute 50 cc of the dilution with double distilled water to make 500 cc and mix well

The final dilution contains 10 parts per million of non-volatile solids

Two 100-cc samples of the final dilution were evaporated to dryness. The residues weighed 0.0010 Gm and 0.0011 Gm

The qualitative tests were made by adding 1 cc of the test solution to 10 cc of the double-distilled water containing the 10 parts per million of added salts and to a "blank" of 10 cc of the double distilled water. Also, a few drops of nitric acid were added in the chloride test, and a few drops of hydrochloric acid in the sulfate test. Comparison was made between the "blank" and the "test" after the two mixtures had stood for five minutes or longer in cylindrical graduated tubes. The results were as follows

Test for	Redistilled Water	Redistilled Water with 10 Parts per Million of Added Salt
Chloride	Unaffected	Very slight cloudiness
Sulfate	Unaffected	Unaffected
Calcium	Unaffected	Cloudiness
Iron	Unaffected	Slight darkening
Copper	Unaffected	
Ammonia	Very light yellow	Light yellowish orange

These results were due to

Test for	Parts per Million							
	Present before T S Was Added		Present after T S Was Added		Solubility in Water *		Insoluble Residue	
Chloride	NaCl	1 00	AgCl	2 45	AgCl	1 52	AgCl	0 93
Sulfate	Na ₂ SO ₄	1 00	BaSO ₄	1 64	BaSO ₄	1 74	BaSO ₄	0 00
Calcium	CaO	5 00	CaC ₂ O ₄	11 55	CaC ₂ O ₄	5 54	CaC ₂ O ₄	6 01
Iron	Fe(NO ₃) ₃	2 00	FeS	0 64	FeS	8 9	FeS	0 00
Copper	Cu(C ₂ H ₃ O ₂) ₂ · H ₂ O	1 00	CuS	0 48	CuS	0 33	CuS	0 15
Ammonium Acetate	NH ₄ C ₂ H ₃ O ₂	4 50						

* 'Handbook of Chemistry and Physics,' 18th Edition, Charles D. Hodgman, Editor

These results indicate that if but 5 parts per million of chemical salts be present in the water, no one of them will appear in the qualitative tests unless it be predominant in the mixture of salts.

A similar set of tests made on 100-cc quantities of the same dilution of the solution of salts in water indicated almost the same results. In 50-cc Nessler tubes the cloudiness might be slightly more evident and in 100-cc Nessler tubes perhaps slightly more evident than in the 50-cc tubes.

THE TEST FOR OXIDIZABLE MATTER

The U. S. P. X uses 0.1 cc of tenth normal potassium permanganate to 100 cc of distilled water, and requires that the pink color shall not be entirely discharged.

tains its prestige among similar publications. The unselfish and scientific character of pharmacopœial work must be maintained if Pharmacy is to merit this rich heritage, and our generation must look well to the spirit with which we approach the forthcoming Pharmacopœial Convention. The eyes of the coöperating scientific world are upon us and we who love our profession must zealously guard the essential standards.

With the limited time allotted for this presentation it is possible to touch only a few outstanding features of the revision. Detailed changes in abstract, in many departments are being published in the A. P. H. A. JOURNAL during the next two months and will provide an opportunity for many to obtain information concerning the changes.

THE TESTS FOR REDISTILLED WATER IN THE NATIONAL FORMULARY VI MONOGRAPH *

BY R. S. ADAMSON, R. K. SNYDER, E. N. GATHERCOAL

The tests in the N. F. VI monograph for redistilled water are as follows:

Tests for Purity—Evaporate 100 cc. of Redistilled Water to dryness on a water bath and subsequently dry the residue in an oven to constant weight at 100° C. not more than 0.0005 Gm. of residue remains.

Separate portions of 10 cc. each of Redistilled Water are not affected by the addition of barium chloride T. S. (*sulfate*), silver nitrate T. S. (*chloride*), ammonium oxalate T. S. (*calcium*), hydrogen sulfide T. S. (*metals*).

Redistilled Water shows not more than a faint yellow color when 0.1 cc. of alkaline mercuric potassium iodide T. S. is added to a 100-cc. portion (*ammonia*).

Add 10 cc. of calcium hydroxide T. S. to 5 cc. of Redistilled Water. The mixture remains clear and transparent (*carbon dioxide*).

Heat 100 cc. of Redistilled Water to boiling, acidulate with 10 cc. of diluted sulfuric acid and subsequently add 0.1 cc. of twentieth normal potassium permanganate. The color of the liquid is not completely destroyed by boiling for 10 minutes (*oxidizable substances*).

Test for Sterility—Follow the general methods given on pages 24 to 26 for the Testing of Ampul Solutions for Sterility. If the sample to be examined is in a bulk package, follow Section D. Plant 10 fermentation tubes with 1 cc. of the sample in each. If growth appears in any of the fermentation tubes, the test may be repeated. These results indicate that if but 5 parts per million of chemical salts be present in the water no one of them will appear in the qualitative tests unless it be predominant in the mixture of salts

A similar set of tests made on 100-cc quantities of the same dilution of the solution of salts in water indicated almost the same results In 50-cc Nessler tubes the cloudiness might be slightly more evident and in 100 cc Nessler tubes perhaps slightly more evident than in the 50 cc tubes

THE TEST FOR OXIDIZABLE MATTER

The U S P X uses 0.1 cc of tenth-normal potassium permanganate to 100 cc of distilled water and requires that the pink color shall not be entirely discharged

Early in the work on ampuls, Dr E B Carter published an extensive investigation on pyrogens and claimed that one-tenth cc of *twentieth*-normal potassium permanganate was ample for this test (see last paragraph of the monograph on redistilled water)

The Joint Contact Committee of the Manufacturers' Associations recommended a modification of this test as follows

"To 100 cc of distilled water, add 10 cc of diluted sulfuric acid, and bring to a boil Add twentieth normal potassium permanganate until a faint pink color is obtained then add an additional 0.2 cc of twentieth-normal potassium permanganate Add a measured amount of the redistilled water being tested until the pink color is discharged, maintaining the solution at the boiling point throughout the test The quantity of this water required to completely discharge the pink color shall not be less than 100 cc (*oxidizable impurities*)"

After a rather extensive investigation by Raymond S Adamson, as reported below, it would seem as though there were several objections to the test for *oxidizable impurities* as presented by the Joint Contact Committee

1 The addition of $N/20$ $KMnO_4$ in appreciable quantity to the preliminary 100 cc of distilled water, introduces an excess of the reagent unless the distilled water be highly contaminated with oxidizable matter

2 The use of 0.2 cc of $N/20$ $KMnO_4$ introduces so much of the reagent that the test becomes very coarse A much decreased amount should be used to insure a reasonable sensitiveness

3 The quantity of redistilled water, added to the original 100 cc of distilled water and the reagents is so great that the color of the permanganate is lost by dilution rather than by a chemical reduction

4 It is a question whether a chemical test can be devised that is sufficiently delicate to detect dangerous quantities of bacteria and of their decomposition or metabolic products Mr Adamson's report indicates a possibility of distinguishing between the presence of 3 bacteria per cc as compared with 5 bacteria per cc To do this, he uses 0.5 cc of $N/1000$ $KMnO_4$ in 100 cc of redistilled water and determines the excess $KMnO_4$ by the use of KI T S and starch T S However, the reading of the test is such a delicate matter that it probably will not be acceptable to some workers It is estimated that one trillion small bacteria yield about 13 mg of protein, and that possibly 500 mg of $KMnO_4$ will be chemically reduced by 1 mg of bacterial protein Therefore, the infinitesimal amount of $KMnO_4$ (about 0.1 cc of $N/1,000,000$) reduced by 500 bacteria is almost too small to measure (0.1 cc of $N/10$ $KMnO_4$ requires about 50,000,000 small bacteria to reduce it)

The report by Mr Adamson is as follows

In the descriptions of these experiments, certain abbreviated forms are used as follows

H_2O = recently prepared double distilled water or such water sterilized within 2 hours after being prepared

H_2SO_4 = Diluted sulfuric acid, U S P

$KMnO_4$ = Potassium permanganate in the designated volumetric solution

Boil = Heated over a flame in a flask to boiling and kept gently boiling for 10 minutes

Experiment 1 —To 100 cc of ordinary distilled water, add 10 cc of H_2SO_4 and bring to a boil, then add 0.05 cc of $N/20$ $KMnO_4$ and boil A pink color remains It is evident, therefore that 0.05 cc of $N/20$ $KMnO_4$ added to a preliminary 100 cc of distilled water is an excess of the reagent unless the distilled water be badly contaminated with oxidizable matter

Experiment 2 —To 100 cc of boiling H_2O add 10 cc of H_2SO_4 and 0.2 cc of $N/20$ $KMnO_4$ and boil Maintain the solution at the boiling point, add a measured amount of tap water until the pink color is completely discharged Twenty cc of Chicago chlorinated tap water completely discharges the color after boiling for 2 minutes

Experiment 3 —To 100 cc of boiling H_2O add 10 cc of H_2SO_4 and 0.2 cc of $N/20$ $KMnO_4$ and boil a pronounced pink color remains

Experiment 4 —To 100 cc of boiling H_2O add 10 cc of H_2SO_4 and 0.1 cc of $N/20$ $KMnO_4$ and boil a distinct pink color remains

Experiment 5 —To 100 cc of boiling H_2O add 10 cc of H_2SO_4 and 0.1 cc of $N/20$ $KMnO_4$ and boil Add to the boiling solution a measured quantity of H_2O maintaining the solution at the boiling point At least 350 cc of the water is added before the pink color is no longer visible

Experiment 6 —To 100 cc of boiling H_2O add 10 cc of H_2SO_4 and 0.1 cc of $N/20$ $KMnO_4$

and boil Add to the boiling solution a measured quantity of H_2O containing 25,000 bacteria per cc Seventy cc of this bacterial suspension, or 1,750,000 bacteria are required to destroy the pink color

Experiment 7 —To 100 cc of boiling H_2O add 10 cc of H_2SO_4 and 0.1 cc of $N/100$ $KMnO_4$, and boil no pink color is visible Cool the solution, add 1 cc of potassium iodide T S and 2 cc of starch T S, and mix a distinct blue color is produced

Experiment 8 —To 300 cc of boiling H_2O add 10 cc of H_2SO_4 and 0.2 cc of $N/100$ $KMnO_4$, and boil no color is visible Cool the solution, add 1 cc of potassium iodide T S and 2 cc of starch T S, and mix a light pink color is produced which gradually darkens to a light purple

Experiment 9 —To 300 cc of boiling H_2O add 10 cc of H_2SO_4 but no $KMnO_4$, and boil the solution is colorless Cool the solution, add 1 cc of potassium iodide T S and 2 cc of starch T S, and mix no color is produced After standing one hour, some darkening occurs

Experiment 10 —To 300 cc of boiling H_2O containing 750,000 bacteria (2500 per cc), add 10 cc of H_2SO_4 and 0.2 cc of $N/100$ $KMnO_4$, and boil no color is visible Cool the solution, add 1 cc of potassium iodide T S and 2 cc of starch T S, and mix no color is produced immediately After standing one hour, the solution becomes darker

Experiment 11 —To 100 cc of boiling H_2O add 10 cc of H_2SO_4 and 0.5 cc of $N/1000$ $KMnO_4$, and boil Cool the solution, add 1 cc of potassium iodide T S and 2 cc of starch T S, and mix a slight purple pink color is produced

Experiment 12 —To 100 cc of boiling H_2O containing 250 bacteria (2.5 per cc) add 10 cc of H_2SO_4 and 0.5 cc of $N/1000$ $KMnO_4$, and boil Cool the solution, add 1 cc of potassium iodide T S and 2 cc of starch T S, and mix a faint pink color is produced immediately

Experiment 13 —To 100 cc of boiling H_2O containing 500 bacteria (5 per cc) add 10 cc of H_2SO_4 and 0.5 cc of $N/1000$ $KMnO_4$, and boil Cool the solution, add 1 cc of potassium iodide T S and 2 cc of starch T S and mix no color is produced immediately

The colors in these experiments are seen to best advantage by using Nessler tubes on a white background and looking down through the depth of the solution in the tube The bacteria used were *Bacillus Coh*

Instead of using starch T S to detect the presence of the iodine liberated by the excess of $KMnO_4$, chloroform may be used To the cool solution add 1 cc of potassium iodide T S and 5 cc of chloroform and mix The chloroform layer receives the iodine color varying from the faintest trace of pink to quite a pronounced iodine color

The presence of the excess $KMnO_4$ may also be detected by adding a few drops of diphenylamine T S to the solution after cooling The solution acquires a blue color, varying in depth according to the amount of $KMnO_4$ present

THE TESTS FOR BACTERIA PRESENT IN REDISTILLED WATER

A test for the sterility of the Water should be included among the tests for purity, and also a test for dead bacteria

As Redistilled Water is practically always intended for parenteral use, the presence of any bacteria either dead or alive, is objectionable, for their protein or their metabolic products may be toxic or anaphylactic when the Water is so used When it is considered that there are many natural spring waters that will show no living bacteria in at least 8 tests out of 10, we certainly should require Redistilled Water, prepared especially to show complete purity to be free from microbic contamination The test for sterility indicated at the beginning of this paper is satisfactory

A test for dead bacterial bodies can quite easily be carried out as follows

Centrifuge a measured quantity of the water, but not less than 10 cc in a suitable centrifuge tube at not less than 2500 revolutions per minute for 30 minutes Pour off the supernatant water and remove the last 0.1 to 0.2 cc from the tip of the tube with a capillary pipette, and place it as a drop upon a glass microscopic slide Rinse the tip of the tube and the pipette with a drop of Redistilled Water and add to the drop on the slide Evaporate the water from the drop on the slide fix the residue to the slide by heat, and stain it with a suitable bacterial stain Not more than five bacterial bodies per cc of water are present in the mount

ASSOCIATION BUSINESS

AD INTERIM BUSINESS OF THE COUNCIL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 1935-1936

Office of the Secretary, 2215 Constitution Ave., Washington, D C

LETTER NO 2

September 5, 1935

To the Members of the Council

For the information of the new members of the Council it is stated that motions made by mail in the interim between meetings of the Council require no second See By-Laws of the ASSOCIATION, page \\\ and By Laws of the Council page \\\, YEAR BOOK Volume 22 Council Letters for the preceding years will be found in the JOURNAL The minutes of the First Meeting of the Council for 1935-1936 are being printed and will be mailed to members of the Council as soon as completed

17 *Committee on Library and Committee on Museum* The secretary reported at the fourth and final meeting of the Council for 1934-1935 that nominations had been received from only two members of the Council (see Council Letter No 13, page 331, No 16, page 512 item 88) and it was decided that these nominations be made a matter of business in the first Council Letter of 1935-1936 The members of the Council are, therefore, invited to submit nominations for these two Committees, under the following motion which was adopted by the Executive Committee and approved by the Council That a special Committee on Library and a special Committee on Museum be created by the Council, membership not to be limited to the Council and to be selected with special reference to their knowledge and experience, to study the development of the Library and Museum respectively and to submit plans with respect to each'

18 *Resignation of E Fullerton Cook as a Candidate for the Presidency* The following letter has been received from Professor Cook

"It was quite a surprise to me to read in the newspaper at Portland that I had been nominated as a candidate for Presidency of the A P H A I had not been consulted concerning this nomination

"While I am deeply appreciative of the honor and confidence which my colleagues have shown in offering this nomination, I find it necessary to request the withdrawal of my name as a candidate Other responsibilities which I have assumed and which must be carried through the next two or three years, would make it impossible—or at least very unwise—for me to even consider additional duties

'I would ask you therefore to place this request before the Council and have the necessary action taken to remove my name from the ballot "

(*Motion No 1*) *It is moved by Kelly that E Fullerton Cook's resignation be accepted and that his name be omitted from the official ballot as a candidate for the Presidency* A vote on this motion will be called for in about one week

19 *Sale and Exchange of Liberty Bonds* Under the Fourth and Final Call the following Fourth Liberty Loan 4 1/4% Bonds 1933-1938 in the funds named have been called for payment on October 15 1935, after which date interest ceases

Fourth Call	\$17,400 00
-------------	-------------

The holders are offered the options of payment in cash or of exchange at par for 10-12-year 2 $\frac{3}{4}$ % Treasury Bonds of 1945-1947. These bonds are not callable before maturity and will be dated September 16, 1935, interest payable on March 15th and September 15th. The right is reserved to increase the price above par by notice after September 10, 1935. The bonds called on March 15, 1935, were exchanged for U S Treasury Bonds 2 $\frac{7}{8}$ %, 1955-1960, at par (see Council Letters No 14, pages 426 and 427, and No 16, page 511).

Chairman Philip of the Committee on Finance writes

"With reference to the Fourth Call for Liberty Bonds and the options offered to holders of these bonds, I recommend with the concurrence of Treasurer Holton that those called be exchanged at par for the 10-12-year 2 $\frac{3}{4}$ % Treasury Bonds 1945-1947, and so move. It is unfortunate that the third member of the Committee on Finance, Dr LaWall, is ill. However it will be recalled that he favored the exchange of the bonds called on March 15, 1935, for U S Treasury Bonds 2 $\frac{7}{8}$ %, 1955-1960. I wish to repeat the opinion expressed at that time, that a higher rate of interest, while desirable, should not deter us from considering the greater safety of the Treasury Bonds, and that security of principal during these trying times for money entrusted to our care, is the first and most important consideration."

(Motion No 2) It is moved by Philip, as Chairman of the Committee on Finance, that the Fourth Liberty Loan Bonds listed above be sold and the proceeds be invested in 10-12-year 2 $\frac{3}{4}$ % Treasury Bonds, 1945-1947, or that the bonds be exchanged on an even basis, and that since some of the called bonds are registered, and at this time is required, the following be adopted (see Council Letter No 14 page 427)

Resolved, that C W Holton, treasurer and E F Kelly secretary, are hereby authorized to buy, sell, deal in, assign or negotiate the called Fourth Liberty Loan Bonds which are owned by, or registered in the name of the American Pharmaceutical Association and to that end, to endorse transfer and deliver the same

By direction of the chairman of the Council, a vote on the motion is called for at this time as the exchange should be made by September 10th

E F KELLY, Secretary

RED CROSS ROLL CALL—NOVEMBER 11, 1928

Red Cross service is as wide as humanity's ills meeting all manner of distress on the basis of individual and community need. Its twofold programs of cure and prevention range in scope from ministering to victims of disasters to teaching how to bandage a cut finger. There is scarcely a situation of human suffering which the Red Cross is not called upon to meet. *The Red Cross extends the annual invitation to make its service possible*

THE EIGHTY-THIRD ANNUAL MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, PORTLAND, OREGON, AUGUST 5-10, 1935

ABSTRACTS OF THE MINUTES OF THE GENERAL SESSIONS

Sessions of the Eighty-Third Annual Meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION were held in Multnomah Hotel, Portland, Ore. A list of members in attendance may be found on pages 679 and 680 of the August JOURNAL.

Some of the Committee Reports referred to in the proceedings have been printed in the Council Minutes, pages 681, *et seq* or elsewhere in the August issue, some are included in this number or will be printed in later issues of the JOURNAL under "Committee Reports" or under 'Addresses'.

FIRST GENERAL SESSION

The First General Session of the Eighty-Third Annual Meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION was called to order by President Robert P. Fischelis in the Main Ball Room of Multnomah Hotel August 7th, at 9:00 A.M. The following former presidents of the AMERICAN PHARMACEUTICAL ASSOCIATION were in attendance (In order of seniority) James H. Beal, E. G. Eberle, W. B. Day, F. J. Wulling, S. L. Hilton, H. V. Arny, L. L. Walton, T. J. Bradley, C. W. Johnson, H. C. Christensen, W. D. Adams, R. L. Swan.

President Fischelis said that it was hoped to have Bishop William Procter Remington, son of one of the distinguished former presidents in attendance. He stated that the former is Episcopal Bishop of Eastern Oregon and read a letter he received from him.

I deeply regret my inability to accept the very kind invitation of the AMERICAN PHARMACEUTICAL ASSOCIATION to attend the Convention to be held in Portland, August 5th-10th. Only my need of a real holiday this summer prevents my taking part in your proceedings. May I take this opportunity of extending greetings to an ASSOCIATION which engaged so much of my father's interest? His life work was Pharmacy and to it he gave the best years of his life in teaching and in writing the text-books which bore his name. I always felt that my father's devotion to his work had more in it than a mere interest in the cure of bodily ills through the scientific administration of drugs. It was the human element, the personal relationship with his many students, their ethical standards and their professional attitudes which engaged his best gifts.

He died ten days before I was consecrated a Bishop in the Episcopal church. It was a disappointment to him that none of his three sons followed in his footsteps. However, his work and mine are essentially the same. There is no separation between the ministering of healing to the sick bodies of people and the direct cure of those ills which lie embedded in their maladjustments to life. If I could bring you a message from him at this time I think it would be this: When you dispense drugs, send out with them a new stream of life, courage to the disheartened, new hope to the sick and a charity which may not bring you greater riches but will make a better world.

Wm. P. Remington,
Bishop of Eastern Oregon."

On request of President Fischelis, Secretary Kelly read the following:

From Dr. George Urdang, honorary member of the AMERICAN PHARMACEUTICAL ASSOCIATION, Berlin—

For the Eighty-Third Annual Meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION, I send my best wishes and my regards to all participants.

I regret it very much that I cannot take part in it. But I hope it shall

be possible for me, in one of the next years, to visit the states and then, naturally, I shall try to come to your meeting

"May all your work promote the progress of American Pharmacy and the welfare of their members "

From Secretary W Gnerich Retail Druggists Association, San Francisco—

"Greetings and best wishes from the Northern California Retail Druggists Association for a successful convention All druggists returning via San Francisco are invited to attend veteran druggists' luncheon on Monday, August 12th, at Stewart Hotel, San Francisco "

Secretary Kelly advised that greetings had also been received from the following Minnie and David C Whitney Kansas City, Mo , K B Bowerman, San Francisco, Cal , Robert W Bohmansson, Eureka, Cal , Mr and Mrs J C Peacock, Philadelphia, Pa , Edward W Runyon, San Francisco Cal , Frank L Grennie New York, N Y

A communication from the Ladies Auxiliary of the North Dakota Pharmaceutical Association, Fargo, North Dakota, follows

"Please convey to incoming President Pat Costello congratulations and best wishes for a most successful year "

President Fischelis remarked that these communications are much appreciated and that due acknowledgment will be made He said that in opening the convention he had used a gavel presented to the ASSOCIATION by Mr Jacobs some years ago The gavel was made of wood taken from the home of Dr Crawford Long who first used ether for anaesthesia

Another gavel was presented to him personally made from wood of a tree planted by Richard Stockton He was one of the signers of the Declaration of Independence from New Jersey "These gavels," he said, 'supply a sound historical background "

President Fischelis then introduced the former presidents of the ASSOCIATION (listed in opening paragraphs) He also introduced President Harvey Henry, of the N A R D , and invited him to a seat on the platform

E G Eherle thought it would be opportune to send a telegram of good wishes to the senior former president John Uri Lloyd President Fischelis said 'Without putting it to a vote I will ask the secretary to convey our respects and greetings to him "

President Fischelis asked for a motion, instructing the secretary to send a telegram of greeting to the Canadian Pharmaceutical Association Convention now in session in Vancouver, B C

A motion was accordingly made and carried

On request of President Fischelis the annual report of the House of Delegates was read by Chairman Rowland Jones On motion duly made and voted the report was accepted

President Fischelis requested Secretary Kelly to present an item of unfinished business The secretary stated 'It will be recalled that President Swain last year in his annual address recommended that the By Laws of the ASSOCIATION be amended to provide that the immediate past president should serve as a member of the Council for the year succeeding Also that at the last annual meeting a motion to so amend the By-Laws as to make this recommendation effective was presented I will so move " It was seconded from the floor

President Fischelis explained "It is moved by E F Kelly that Article I of Chapter III of the By-Laws be amended by the insertion of the words 'the immediate Past-President' following the words 'The President' in line three (3) with the object that the retiring president shall be an ex-officio member of the Council for the year following his term as president " He presented the motion to adopt and it was carried by vote

President Fischelis then turned the meeting over to First Vice-President George D Beal, who said "We will now listen to the reading of the President's address by R P Fischelis, President of the AMERICAN PHARMACEUTICAL ASSOCIATION "

President Fischelis in his introductory remarks stated "We have had a busy year Secretary Kelly and I were busy in Washington with a number of things that came up in connection with legislative and other contacts with the Government, so that much of what I have to say to

you this morning covers some of these last-minute activities and some of it had to be prepared at the last minute. Naturally in reporting the activities of a year we are inclined to report them rather fully and I shall take the liberty this morning of paraphrasing some parts of what will appear later in print, to save your time and not try your patience too greatly."

President Fischelis thereupon read the annual address, including seventeen (17) recommendations which he submitted as a part of the address on which action could be taken in detail, later in the meetings.

Chairman Beal said that President Fischelis' interesting and constructive address is by rule referred to the Committee on Resolutions of the House of Delegates (see pages 635-655 August JOURNAL).

President Fischelis resumed the Chair and thanked Vice-President Beal.

There being no New Business President Fischelis, owing to the absence of Chairman H A B Dunning, requested Secretary Kelly to present the Report of the Committee on Maintenance. Secretary Kelly before reading the report, stated:

"I was requested by Dr. Dunning to express his regret at his inability to attend in person and give you a somewhat more definite report of the work of the Committee. You realize of course, that if we attempt to deal with the work of the Committee it would take up a great deal of time. It is the hope of Dr. Dunning that the report will indicate to you the sincere effort being made by the Committee to cooperate."

Secretary Kelly thereupon read the report as follows:

REPORT OF THE COMMITTEE ON MAINTENANCE AMERICAN PHARMACEUTICAL ASSOCIATION

It will be recalled that at the last annual meeting, President Swain recommended that the Committees on Headquarters Building, on Site and on Plans be discontinued since the work of these committees was practically completed with the dedication of the American Institute of Pharmacy and that a Committee on Maintenance be provided to accumulate a maintenance fund both of which recommendations were approved.

Later, President Fischelis appointed H A B Dunning, Baltimore, Md, E F Kelly Washington D C, R L Swain Baltimore Md, S L Hilton Washington D C, and R P Fischelis Trenton N J, as members of this Committee with the writer as its *Chairman*. In the meantime however, invitations to subscribe to the fund had been issued in letters and in an open letter addressed to the pharmacists of the country. Although the response has not been as satisfactory as we had hoped for we are pleased to report the following, and it should be explained that the accounts of the Headquarters Building Fund and the Maintenance Fund are being kept separately.

Three new subscriptions amounting to \$135.00 and several payments amounting to \$160.00 have been received for the Headquarters Building Fund.

The subscriptions to the Maintenance Fund total \$132,036.00 of which \$50,000.00 represents a bequest to be paid later leaving a difference of \$82,036.00. Of this latter amount \$64,436.00 has been paid.

At the time it was dedicated there was approximately \$40,000.00 due on the building, the grounds, the furniture and the fixtures. All of this has been paid with the exception of approximately \$10,000.00 due on planting and the balance on hand in the Maryland Trust Company amounts to \$14,844.56.

The only other obligation against the project is the mortgage of \$36,400.00 held by the George Washington University on account of the lot in the rear, which we were obliged to purchase in order to obtain the necessary frontage for the building. This obligation can be reduced from time to time and is amply protected by the bequest of \$50,000.00 above mentioned.

The operating expenses of the building are very moderate and with the exemption from taxes recently granted there appears to be no reason why the expenses should be materially increased even when the Building is fully occupied.

It is important to bear in mind that the exemption from taxes shall continue so long as the property is used for its present purposes and that occupancy of the Building is limited by the act of Congress to those organizations and institutions serving American pharmacy on a non-profit basis. It seems quite correct to say that with the exemption from taxes the plans we originally

had in mind have been carried out and that the American Institute of Pharmacy is on a sound financial basis and does not represent, in any sense, a threat to the security and safety of our ASSOCIATION

Substantial progress has been made in developing the Library and Museum and it must be evident that the basic work required to collect and place the material at hand has taken much time and effort. Additional funds must be secured to develop these important features of the Institute and it is the purpose of the Committee to continue its efforts in this direction. Contributions of materials are solicited as well as money.

Nothing can be announced about the Research Laboratory at present. When the revisions of our books of standards are completed in the near future, the plans for a laboratory will be taken up with the expectation that it can be developed in keeping with our requirements.

In addition to the subscriptions above referred to, a number of gifts have been made, of which the following are the more important.

The School of Pharmacy, University of Minnesota, presented a valuable exhibit consisting of photographs of the plant gardens and milling equipment of the School and of the medicinal plants grown and prepared therein. The photographs are handsomely mounted in a display stand and have interested many visitors as illustrating an important pharmaceutical activity not generally known to the public. This type of educational exhibit is very helpful—and it is hoped that each school and college will present an exhibit illustrating some outstanding activity of the institution.

Mr. and Mrs. J. C. Peacock, both of whom are life members of the ASSOCIATION, have presented through President Fischelis—a complete projection apparatus for the meeting room which is a valuable addition to our equipment. Several medical and scientific organizations have met in the building and the contacts thus established will be beneficial.

The District of Columbia Pharmaceutical Association recently presented a fund of \$250.00 for a special purpose which has not yet been worked out.

The National Association of Boards of Pharmacy contributed a set of its proceedings. Mr. O. U. Sisson, an enlarged photograph of "The Laboratory."

Miss Esther Barney, a framed and colored picture of the Pharmacy Exhibit at the Century of Progress, Mrs. True and Mrs. Holton, a counter scale and other equipment from the original Sharp and Dohme retail pharmacy as well as a number of photographs, Mrs. Harvey A. Wiley, a number of books and pamphlets from the library of her late husband.

A number of other interesting and valuable gifts might be mentioned but those referred to will illustrate that interest is being taken and no doubt the number and the scope of contributions will increase as the Institute and its purpose becomes better understood.

Reference should be made to the many visitors to the building—no particular effort has been made to invite visitors because the library and museum were being organized. However, the number of visitors, pharmacists and those connected with the drug industry as well as members of the other public health professions, government officials and laymen, is steadily increasing. They come from every section of the country and from many foreign countries. Their comments indicate that the impression created by the building, the location, and the purposes for which the Institute is intended is favorable for pharmacy.

It is difficult to estimate the practical value of the Institute when it is developed and occupied as planned and when it can be thrown open to visitors for certain hours each day. The bureau which conducts the thousands of high school students who annually visit Washington has requested to be advised when our building may be added to the list of institutions to be inspected.

The Committee wishes to record its appreciation of the support given the project during the year and to again invite continued cooperation.

Respectfully submitted,

H. A. B. DUNNING, *Chairman*

Secretary Kelly concluded: "President Fischelis, Dr. Dunning has also asked me to briefly refer to two developments in our immediate neighborhood which it is felt will interest members here, and will indicate our favorable position in the city of Washington, and that we were fortunate in securing our location in the Capitol City at the time we did."

Secretary Kelly thereupon gave a brief report of the two developments in question, and at

the conclusion of his remarks informed President Fischelis that "Dr Dunning asked me to express his greetings to all in attendance"

The references were (1) That the site between Twentieth and Twenty First Streets has been allocated to the Federal Reserve Bank which will erect thereon, beginning this fall a building for its headquarters This site is the only one facing on Constitution Avenue which had not been allocated, (2) most tentative plans for the development of the area to the rear of our site have been published and indicate that this area will be developed in keeping with this important section of the Capitol City

President Fischelis referred to the fine report on the headquarters building

A motion was made by H W Youngken seconded by Mr Frank Mortensen, that the report be received for publication—Carried by vote

The secretary also referred to the plans of the Landmarks Society of Alexandria Va, for the restoration of the building occupied by the Stabler Leadbeater Apothecary Shop since its founding in 1792 The equipment stock, records etc of this pharmacy are owned by the AMERICAN PHARMACEUTICAL ASSOCIATION and will be housed in the restored building as a museum Reference was also made to the exhibition of materials from this pharmacy in the lobby of the hotel

President Fischelis introduced Dr Joseph A Pettit, who delivered an address on "The Practical Value to the Pharmacists of the Activities of the Council on Pharmacy and Chemistry of the American Medical Association" (Copy of the address is to be supplied by Dr Pettit for publication in a later issue of the JOURNAL)

President Fischelis thanked Dr Pettit for his very interesting discussion of the work of the Council

President Fischelis introduced Dr P T Meany of the North Pacific College, Portland who delivered an address on "Dentistry and Pharmacy"

Dr Meany prefaced his address by saying that he was interested in pharmacy In 1900 he contributed to the collection of cascara bark (The address is to be published in a later issue of the JOURNAL)

President Fischelis thanked Dr Meany and expressed appreciation of the coöperation existing between dentistry and pharmacy

On motion, duly seconded, the first General Session was then adjourned

SECOND GENERAL SESSION

The Second General Session of the AMERICAN PHARMACEUTICAL ASSOCIATION was convened in Multnomah Hotel Thursday August 8th at 2 00 P M by President Robert P Fischelis He called for the reading of the minutes of the First General Session these were read by Secretary Kelly and by motion duly seconded and a vote they were approved (These minutes are printed in this issue of the JOURNAL) Secretary Kelly read a communication from Secretary John W Dargavel of the National Association of Retail Druggists it follows

Regret that circumstances beyond my control prevent my attendance at meeting of AMERICAN PHARMACEUTICAL ASSOCIATION Please convey my best wishes for a most successful and constructive meeting and also the appreciation of National Association of Retail Druggists for splendid cooperation and help you have given during past year for benefit of commercial pharmacy It has been a pleasure to work with you and I am sure there is a much better understanding between the two associations than there has been in past years Please be assured that we will do everything possible to see that this feeling is strengthened We are cognizant of the fact that by working together the two associations can be of mutual benefit"

President Fischelis expressed the pleasure of the ASSOCIATION and stated it would take the usual course

The report of the House of Delegates was read by Chairman Rowland Jones and it was approved on motion duly seconded and a vote

An address "The Pharmacopœia of the United States and the Federal Food and Drugs Act" as presented by James H Bial

President Fischelis referred to the fine presentation and asked for discussion of the address, if desired

There was no discussion and on motion of F H Freericks and seconded by Henry F Hein, the address was accepted for publication (It appears in this issue of the JOURNAL)

Local Secretary A O Mickelsen made announcements relative to the entertainment programs

The report of the Special Committee on The Council on "Pharmaceutical Practice," was presented by Chairman E Fullerton Cook, it follows

REPORT ON THE PROPOSED COUNCIL ON PHARMACEUTICAL PRACTICE ¹

At the last meeting of this ASSOCIATION, in the General Session, an opportunity was given for the discussion of a suggestion that the AMERICAN PHARMACEUTICAL ASSOCIATION establish a unit to actively operate in the national field of professional pharmacy both as an inspirational and an evaluating body

After the discussion a Committee of the ASSOCIATION was appointed to give the proposal further study and to report directly to the AMERICAN PHARMACEUTICAL ASSOCIATION Council After considerable correspondence the members of this Committee met at the headquarters building in Washington, reviewed the plans outlined a tentative program and submitted their suggestions to the A P H A Council

The Council subsequently passed the following resolution

"The A P H A Council approves the establishment of a Council on Pharmaceutical Practice to be conducted under the auspices of the AMERICAN PHARMACEUTICAL ASSOCIATION with personnel as recommended by the Special Committee, and the Special Committee is continued for the purpose of developing the plan in conjunction with the Council on Pharmaceutical Practice to report at the Portland Meeting "

The first step has therefore been taken toward the development of a plan of far-reaching significance to American pharmacy, and the Council of this ASSOCIATION is on record as approving the establishment of this new Council

Various members of the Special Committee were assigned specific phases of the question for further study and their reports have been reviewed and the whole question further discussed since reaching Portland this week

The Committee has decided at this time to submit only a tentative report, outlining the general proposal and invite further discussion and suggestions from the pharmacists and physicians of the Country

If the suggestions are approved and a practical plan for its operation can be developed, the "Council on Pharmaceutical Practice" can be organized and its program started It is recognized that to effectively operate the machinery of this organization many difficulties will have to be overcome and an effective executive force established The questions now to decide are whether such a body is needed, whether the AMERICAN PHARMACEUTICAL ASSOCIATION is in a position to effectively handle it and whether the pharmacists of America will support it

But the tentative plan must be given before these questions can even be discussed It will be understood, of course, that whatever cannot be outlined is subject to modification and that it is offered as a basis of discussion, but that it does carry the basic principles of such an organization

The Tentative Plan—Objectives—To develop and improve the practice of professional pharmacy in the United States in at least three divisions, *viz* (1) among retail pharmacists in community practice, (2) in hospital pharmacy, and (3) in pharmacy in Government services

Title of the Directing Body—"The Council on Pharmaceutical Practice "

Representatives on This Council—The Executive Body

A Pharmacist in retail service

A Hospital pharmacist

A pharmacist in Government service

¹ Presented at Portland, A P H A meeting, August 1935

The Chairman of the U S P Revision Committee
 The Chairman of the N F Revision Committee
 A representative of the American Association of Colleges of Pharmacy
 A representative of the National Association of Boards of Pharmacy
 The A P H A President *ex-officio*
 The A P H A Secretary *ex-officio*
 A full time director

In addition to the executive body it is also recommended that one representative from each of the following organizations be invited to participate solely in an advisory capacity, in some of the conferences of the Council

The American Medical Association
 The American College of Surgeons
 The American College of Physicians
 The American Dental Association
 The American Nurses Association
 The American Hospital Association
 The National Association of Retail Druggists
 The American Drug Manufacturers Association
 The Food and Drug Administration
 The Surgeon General of the Public Health Service
 The Surgeon General of the Army
 The Surgeon General of the Navy

The significance of conferences with representatives of these groups is evident. The pharmacist in the hospital must become a part of the medical service and cooperate effectively with the other professional divisions of the hospital. The same is true of the medical departments of the Army, the Navy, the Veteran's Bureau and the Public Health Service.

The standards and duties of the pharmacist in government departments must be developed in consultation with the medical groups if the pharmacist is to render efficient and effective service.

The pharmacist in community life has duties in a wider latitude of operations but the specific phase of his pharmaceutical service, with which this Council is concerned, is that which brings him into close affiliation with the medical and dental professions and provides in this field the opportunity to supply an important and necessary link in the maintenance of health.

There have been repeated evidences that the public is interested in this problem. Individual members of the medical profession and organized medical groups are asking that there may be some indication whereby they can be guided in the selection of pharmaceutical service. Naturally they turn to the AMERICAN PHARMACEUTICAL ASSOCIATION as a material organization established for the purpose of promoting professional pharmacy.

The Functioning of the Council—It is likely that there would first be a thorough study of the present needs in each of these fields of activity followed by an intensive educational program. While basically the same knowledge is needed in all three divisions the detailed plans and their application will have to be different in each group.

These preliminary studies leading to the development of an approved program and the winning of the enthusiastic support of the associated professions must precede what it is believed will ultimately be its most significant feature, namely, the offering of an opportunity to pharmacies and pharmacists in community service to register with this National Council thus establishing their status as professional pharmacists before the community and medical profession.

The basic principle will have to be voluntary registration. Pharmacists who have demonstrated their interest in professional pharmacy by establishing pharmacies well equipped to perform the many duties presenting themselves in this field who are maintaining the professional standards as evidenced by their own practices and consequently have the confidence of members of the medical and dental professions and of the public should have no difficulty in demonstrating these facts and of receiving recognition.

Naturally those who take this step will benefit in many ways and the AMERICAN PHARMA

CEUTICAL ASSOCIATION will be performing a service to pharmacy, to medicine and especially to the public through improved medical service

If this plan is approved the details will have to be developed and a full time director of the program, with suitable secretarial help, will be a necessary feature. The issuance of the many professional helps to those registered with the Council and especially the conduct of the organization needed to check for approval those pharmacies and pharmacists applying for registration, make this a necessity

Discussion of the proposal is invited and it is recommended that the A. P. H. A. Council approve the continuance of this committee to further study the plan before any effort is made to start any of its functions

The Committee,

H. V. Army	E. N. Gathercoal	R. P. Fischelis	Edward Spease
C. B. Jordan	E. F. Kelly	Robert L. Swain	Robert R. Gaw
E. Fullerton Cook, <i>Chairman</i>			

President Fischelis said: "This report is now before you. The Council on Pharmaceutical Practice has been studying this subject for the past year. I know that many of you must be interested in what they are trying to do. This is the time to voice your views on the subject."

DISCUSSION

H. V. Army: "I would like to discuss the subject solely from the standpoint of the registration of prescription pharmacists. This has been dear to my heart for more than twenty-three years. Back in 1912, I read a paper at the Denver meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION on what I called the American Institute of Prescriptionists. This was the first definite proposition made concerning this matter. I read some years ago a statement made in a scientific journal to the effect that any man who makes an outstanding discovery has to wait twenty years before it is realized. It is now twenty-three years since this proposition was brought out. I want to disclaim any precocity for my idea.

'In 1910 my good friend Dr. Walter Bastedo read a paper before the Academy of Medicine, New York, referring to the horrible degree of commercialism among the pharmacists in New York. He knew what he was talking about. He was not only an eminent physician but a pharmacist before he became a physician.

"In that paper of 1910, Dr. Bastedo suggested to the Academy of Medicine that the time would come when it would be necessary for doctors to have a list of certified pharmacists.

"It was just at that time we first heard of certified milk. Milk of all kinds was being sold regardless of standards. As you know, this certified milk authority investigated dairies to find which were safe and that was called certified milk. I see the danger of the certification of pharmacists by the medical group. For that reason I brought the paper to the Denver meeting. I requested that a committee be appointed to study the question, suggesting the matter to a group of outstanding men in our Association at that time. I also suggested that it was too important a matter to handle in that meeting, and asked that the committee report the following year.

'When the report was submitted in 1913 it came from one of the most eminent practitioners of that time. He has now gone to his reward. The report consisted in the decision that it was best to defer action.

'I have since addressed pharmaceutical groups in various cities. We stand now exactly where we stood in Denver in 1912—nothing done. The reason is the apathy of prescription pharmacists. They did not care to have it. I might make two notable exceptions—Dr. Hilton and Dr. Lascoff were willing. Other pharmacists were not willing. Those men who enjoyed high reputations as prescription pharmacists were enjoying a fine business and did not care to share it with others. I state this plainly because it is so. I made my swan song plea before the Academy of Medicine in New York and stated it was the last time I would bring the matter up.

I want to point out that as time has gone on, things have gotten worse and worse so far as commercialism of stores is concerned. I hope that my friends who are commercial pharmacists will not be offended. I even dare to say that only one out of one hundred stores is of the sort where I would want one of my own prescriptions filled. We have statistics which show that there

are 50,000 to 60,000 drug stores in this country, and there is not enough prescription business to support more than 5000 prescription drug stores. The problem is to segregate.

I think Chairman Cook's report is a model of skilful pleading. He has emphasized as much as he could that it has got to be, first of all, a voluntary action on the part of the prescription pharmacists.

If this proposal goes through it will act as a buffer between the prescription pharmacist and the prescribing physician. It will be a voluntary undertaking open to all prescription pharmacists, offering their names and submitting themselves and their pharmacies to an examination and permitting themselves to be enrolled upon the selected list of certified pharmacists. It is up to the prescription pharmacists to accept the invitation and receive the benefits.

"If you do not permit the AMERICAN PHARMACEUTICAL ASSOCIATION to do this service for you the American Medical Association or some similar medical body will do it for you, with the result you will be under medical domination."

R V Robertson. My father and I are in the prescription business in Spokane. To me this is an outstanding move. We haven't a large business. We live and are happy. I do think we have here the start of something that can grow more than we realize. The American Medical Association's success, I believe, has been based largely upon its integrity within itself and its ability to control its own members. I agree with Dr. Arny that if we do not do it ourselves it will be done for us. I trust that wheels will be moved in this meeting that will further this.

S L Hilton. I have had the experience of more than twenty years of conducting a professional pharmacy. I cater almost exclusively to the physician and to the physician's patients. I think it fortunate that at the outset I was invited to become a member of the Medical Association of the District of Columbia. That entitled me to a fellowship in the American Medical Association. I receive every Saturday morning a copy of the *Journal of the American Medical Association*. The first thing I do is go over the copy as I know that before the day passes I will receive one to ten requests from physicians concerning it. I compel my clerks to do the same thing so that in my absence if a request comes from a physician they can comply. I have it on file in a regular filing cabinet where we can turn to it quickly. The result is, physicians at Washington are constantly in consultation with me and my clerks. It has been an advertisement that has been most profitable. I can say that 65-75 per cent of my business comes over the telephone and comes from the best people in Washington. I have felt that it has been one of the best assets I have had, to have cultivated the good-will of the physician and get the business. I have a complete line of bacterial strains, reagents that will keep so we are able to supply the demand promptly. Those that do not keep we make to order. We have one good size closet full of these products. We are constantly making them. We carry quite a stock of chemical glassware, and that is a profitable line. The physician appreciates it. I feel that the more we can do to assist in this movement in our own ranks the better it is for us, because if we do not do it someone else will do it for us and we will have to comply. Thank you.

President Fischelis requested expressions from retail pharmacists on the proposal if deemed not feasible.

Chairman E Fullerton Cook explained that the major objective is to give an opportunity to the professional pharmacists to register with the National Council and, in that way, acquire a distinctive place in the community by informing the public they are qualified to render professional service.

Frank Mortenson inquired whether the National Council will pass on pharmacists who are qualified. Chairman Cook replied in the affirmative and Mr. Mortenson stated that one pharmacist might be approved, another not.

Chairman Cook replied that this is the crux of any proposal of this kind and that it would not be possible for anyone to say at this time how the selection would be made. The pharmacist would apply for the opportunity, he would be requested to fill out a blank with facts concerning his pharmacy. If these are not acceptable the deficiency will be pointed out and an opportunity given him to conform. If the report is in conformity with the questionnaire then some plan of inspection would be followed. The American College of Surgeons has a plan of this kind in operation. They very carefully secure data concerning the surgeons and when accepted by the

Council they are registered. It is a very important factor in the success and standing of the surgeons of the United States. This plan would be operated in a similar manner.

Henry Hein remarked that this is a complicated subject and he was not surprised to learn of the time it has taken to arrive at this point. The cooperation of physicians is essential for effective operation.

President Fischelis asked for the views of a hospital pharmacist on the subject.

William Gray said that a hospital pharmacist has the viewpoint of the physician rather than the pharmacist, his duty is to serve the physician and answer all questions regarding pharmaceutical preparations. He is called upon for information regarding products. Therefore, in that respect a hospital pharmacist is listed in the effort.

H. A. K. Whitney stated he had all the bias of an individual who prides himself on the general practice of pharmacy, and pharmacy, only. Last year he was so attracted by this proposal that he took it upon himself to inquire in his home town, a city of 27,000 people, where there are two pharmacists, at least, who might qualify. Accordingly, he interviewed two of the proprietors and explained the proposition. In each instance the proprietor of the store intimated he would welcome an opportunity to ask for registration and would be pleased to display the emblem.

He approached another pharmacist, in a city of 11,000 people, who has been making an effort to contact the physicians. The results were favorable. Since then he has interviewed others with encouraging results. He believed that this proposal, if accepted, will be happily received by the pharmacists of the United States who are professionally minded.

President Fischelis pointed out that this is not an attempt on the part of the AMERICAN PHARMACEUTICAL ASSOCIATION to divide drug stores arbitrarily into two classes. The opportunity for certification is not limited to exclusive prescription pharmacists. Any store, properly equipped that can render the type of service required by the medical profession to day will be eligible to certification. He desired all to carry away a correct impression, those who have contributed to the deliberations have made it possible for the committee to intelligently study the proposal.

John Culley asked whether a provision for the emblem would show the public and the physician that the pharmacist is registered with the Council.

Chairman Cook felt assured that an emblem would be provided which would indicate its purpose.

C. E. Mollett said he was greatly interested in the proposal, it was one step in advance of that taken by Texas and California. They have tried to develop this idea. He hoped for the success of the movement, for it will be a wonderful thing for the professions. If a pharmacist is capable, if his equipment is proper, and he makes his displays so it is apparent that he practices pharmacy rather than merchandising, then the physician becomes a walking advertisement for him.

Edward Spease "The American College of Physicians and the American College of Surgeons have been mentioned here. They have undertaken certain functions. One is the selection of members. There are only a few members of the American College of Surgeons in each locality.

'One of the additional functions is known as approval of hospitals,' it means a study of each and every department in a hospital and certain regulations. Regulations have never been laid down for pharmacists in hospitals. We have been asked to outline recommendations and to appear before the American College of Surgeons in San Francisco this fall to present the matter and discuss the regulations which they hope ultimately to adopt. One of the first principles will be that every hospital must have pharmacy service, *first*, a resident pharmacist, or, *second*, pharmaceutical service from a proper pharmacy on the outside. That leads to the question. What is this approved pharmacy or proper pharmacy on the outside?"

Dean Spease considered this movement very timely and one that should be given consideration.

A motion was made by him, and duly seconded, that the recommendations of the committee be adopted.—Carried.

The next subject of the program was an address illustrated by lantern slides on "Prescription Department Economics—Some High Lights of the Revised Edition of the Professional Pharmacy" by Frank A. Delgado. (The address will be published in a later issue of the JOURNAL.)

President Fischelis commented favorably on the paper and announced as the next feature of the program a "Symposium on Prescription Pricing," presented by F C Felter

Mr Felter stated that he understood there would be two other speakers on the subject—Leonard Seltzer and G L Seecord neither of them was here to present the papers Mr Seltzer's paper was read by C Leonard O Connell and will be published later Mr Felter presented his paper which is published in full in the *Pacific Drug Review* for September pages 28-34

There being no further business the meeting was adjourned

THIRD AND FINAL GENERAL SESSION

The Third and Final General Session of the AMERICAN PHARMACEUTICAL ASSOCIATION was convened at 8 00 P M Friday August 9th, by President Robert P Fischelis

The minutes of the Second General Session were read by Secretary E F Kelly, and approved President Fischelis stated that in the First General Session a telegram of greeting was sent to the Canadian Pharmaceutical Association in session in Vancouver B C The following message from this body has been received

Reciprocate good wishes for successful Convention Stop May your deliberations result in elevating the status of pharmacy and improving business and professional conditions hearty greetings to your members from Canadian Pharmaceutical Association

(Signed) R B J STANBURY *Secretary*

President R P Fischelis read a telegram from the Senior Past President John Uri Lloyd

Greatly pleased to be remembered by my friends of the AMERICAN PHARMACEUTICAL ASSOCIATION Much regret I could not be present Accept my thanks for your kind message With my best wishes for all

(Signed) JOHN URI LLOYD

President Fischelis read a communication received from Dr Edward Kremers, a former Honorary President of the ASSOCIATION, as follows

Traveling with the AMERICAN PHARMACEUTICAL ASSOCIATION for a lifetime I have seen many a state of the Union, but it has never been my good fortune to join my fellow members when our organization met in the Rockies or beyond When, therefore, the ASSOCIATION decided to meet this year in Portland, I planned to go for I considered it my last opportunity to see the Pacific 'Behuet dich Gott es waer so schoen gewesen,' Behuet dich Gott, es hat nicht sollen sein However unlike the trumpeter of Saeckingen, I do not bemoan my misfortune for I have assurance that I am at the present moment most needed where I am Four candidates for the doctor's degree demand my presence here whereas at Portland there will be many a younger representative of American pharmacy to fill my breach due to my absence

However my thoughts are with the members of the AMERICAN PHARMACEUTICAL ASSOCIATION and more particularly with those members to whom I am attached by personal friendship To one and all I send cordial greetings in the hope that the Portland sessions may prove another step in the advancement of the calling we love and to which we have pledged our best life activities

Sincerely yours,

(Signed) EDWARD KREMERS

President Fischelis said that these communications will take the usual course

The final report of the House of Delegates was read by Chairman Rowland Jones of the House of Delegates

Chairman Jones called upon Mr R L Swain to read the Resolutions approved by the House of Delegates by title After reading them President Fischelis asked for a motion A motion was duly made and seconded that the report of the House of Delegates be adopted—Carried President Fischelis called attention to the fact that the local press has been unusually

generous with reports of the convention The Local Committee made clippings, which were displayed

There being no unfinished business, President Fischelis requested Secretary Kelly to make a presentation He said in part "Among the efforts to secure popular recognition of pharmacy in the United States we recognize the exhibit at the Century of Progress Exposition in Chicago Many of us had the opportunity to visit the exhibit, and many have read about it in the lay press We realize that it created a profound impresson on the large numbers who were privileged to view the exhibit and recognize the great effort in time and attention to make this exhibit possible and to make it an outstanding success It is well known that the work was in charge of and definitely under the leadership of one of our prominent members

"At the meeting of the ASSOCIATION in Madison, two years ago, the Council authorized the secretary to prepare a tribute in suitable form When the secretary was ready to proceed with this very pleasant duty the chairman of the Committee, with his characteristic modesty, insisted that the tribute be paid to the other members, as well as himself With that understanding, the Council has instructed the secretary to comply with the request Now as most of you do not recognize of whom I am speaking I will ask Dr H C Christensen to please come forward Chairman Christensen is a man of parts, a man of distinction To night he stands here to represent not only himself but also the other members of the committee, Mr Julius Riemenschneider and Dr Frank A Kirby Those who visited the exhibit will recall that it was supervised by a very dynamic person, Miss Esther Barney In addition a student from the School of Pharmacy, University of Illinois Mr Niemie, contributed his services to demonstrate pharmaceutical dispensing Chairman Christensen has kindly consented to accept these memorials for himself and for the others in his organization for a most outstanding contribution to pharmacy

"Mr Christensen, I recognize that you have many things to frame in your house and feel sure Mrs Christensen will make room for this additional memorial I take pleasure in presenting to you these very simple but no less sincere tokens of our appreciation of the services of yourself and your associates, with the hope that they will be constant reminders of our appreciation and of the favorable impressions made on the many thousands who saw the exhibit "

H C Christensen spoke in part as follows

"Members of the ASSOCIATION, *Guests and Ladies* I hardly know what to say This was a complete surprise to me I am, however, happy to know that the effort we made to bring to the attention of the public the service which pharmacy renders to that public has been appreciated to such an extent by this wonderful ASSOCIATION, so that they recognize by this memento to me as *chairman*, and to my assistants on the committee for the exhibit, the efforts we made The time is too short to go into any details of the exhibit Those of you who visited it know what it consisted of, and the methods which we used in reaching the public

"This morning I presented what I titled as Part I of a history of the exhibit The first part mentions items regarding the inception, how it was suggested, and how it was finally taken over by the AMERICAN PHARMACEUTICAL ASSOCIATION and delegated to the Committee to carry out It would have been impossible for your Committee to carry out this problem without the assistance which it received so loyally not only from those in the profession but from many associated with the profession in the drug industry generally

"We collected something over \$14 000 00 We still have a little balance on hand which I might say will be used to install a reproduction of the exhibit in the Museum of Science and Industry in Jackson Park, Illinois on the site of the old Fair Grounds of 1893 This building, as some of you know, has floor space of between ten and twelve acres and a proper amount of space has been allotted to pharmacy for this exhibit Pharmacy will be one of sixteen exhibits mostly medical in a department to be known as the Department of Medical Science The pharmaceutical exhibit will be permanent We hope to reproduce the exhibit as it was at the Exposition in Chicago but we have in the contract the privilege to enlarge on the Exposition exhibit and make it permanent I believe you will agree that it is a great thing for pharmacy to be recognized on a basis with other medical science I believe this is the first time in the history of pharmacy that anything of that extent has been known "

Chairman Christensen thanked the ASSOCIATION and said he would convey these mementos to his colleagues in Chicago

There being no new business President Fischelis announced the presentation of the Ebert

Prize by Dr E V Lynn Chairman of the Scientific Section He said "It is my pleasure to formally announce that the Ebert Prize for 1935 has been awarded by the Committee on Ebert Prize to Professor Marvin J Andrews of the School of Pharmacy of the University of Maryland Baltimore, Md, for his papers on 'The Determination of the Reasonable or Permissible Margin of Error in Dispensing' presented to the Section on Practical Pharmacy and Dispensing To our regret, Professor Andrews was prevented from attending and receiving the award in person"

President Fischelis stated that as Professor Andrews is not here he would ask Secretary Kelly a very close friend to the Professor and who will no doubt have an opportunity to present the prize in person, that he do so when opportunity affords We are, of course, very sorry that Professor Andrews is not here to receive it in person

The next order of business was the installation of officers and President Fischelis requested L L Walton, who has in recent years served as installing officer, to come to the speakers' table He also called on William B Day to assume the active duties of Installation of Officers

President Fischelis said that only three new Council members are elected each year, and asked James H Beal, C H LaWall and R L Swain, to come forward Due to serious illness Dr LaWall was not present, the other members were duly installed

The Second Vice-President J Lester Hayman, and First Vice President, Frank A Delgado, were duly presented and installed

Editor E G Eberle and Secretary E F Kelly were presented

Owing to the absence of Treasurer Charles W Holton he was represented by Hugo H Schaefer in the installation

The officers of the House of Delegates, who had been installed were presented Roy B Cook *Chairman*, and C Thurston Gilbert, *Vice Chairman*

The installing officer said it was now in order to mention the most important member of this group, the man to whom the membership of the ASSOCIATION gives the greatest honor within its power and accompanies therewith the greatest responsibility, a man who has served the ASSOCIATION faithfully and well, who has presided over our House of Delegates very patiently and efficiently and to the satisfaction of the members, and who will make a worthy successor to our president—I refer to Patrick H Costello, of North Dakota and ask his presence up here before the assembly

President Fischelis said *President Costello*, you come to this office with a background of considerable experience not only as a pharmacist but as an Executive Officer of the Board of Pharmacy Shortly after I became president of this ASSOCIATION I was talking with a distinguished dean outside the field of pharmacy He was discussing what I might do in this office He said 'I have one piece of advice to give you—be yourself' I am sure if the president elect will 'be himself' we will be furnished with a very fine and efficient administration President Costello, I turn over to you the badge of office I know you will reflect honor on the AMERICAN PHARMACEUTICAL ASSOCIATION I turn over to you the gavel knowing, as do our members that you will use it wisely and well in presiding over the General Sessions "

Mr Costello Thank you Dr Fischelis for the praise you have given me I trust I will carry on in a manner you will approve of I am sure that as you relinquish the duties of president you will continue to give the type of service to the ASSOCIATION that you have in the past with distinction to yourself as a pharmacist "

President Fischelis called upon Mr Patrick H Costello for his address He spoke in part as follows

INSTALLATION ADDRESS OF P H COSTELLO

It is with a deep sense of gratitude and appreciation that I assume the duties and obligate myself to the responsibilities of the office of the President of the AMERICAN PHARMACEUTICAL ASSOCIATION The privilege of serving in the capacity is a distinction which I did not aspire to nor did I expect to be thus honored Only a comparatively few members have received this distinction and in my opinion the selection of my predecessor evidenced the good judgment of the membership

My desire is to serve acceptably and merit your approval—to do so will necessitate calling upon those who have guided and administered the ASSOCIATION wisely thus far for their counsel and advice in directing the affairs of this organization

In assuming my position without taking certain preparatory steps, it is apparent that the lack of information concerning details connected therewith serves as a temporary handicap. Unfortunately, or not, that is the situation, in the light of which it is not for me to make specific recommendations or criticism immediately after my induction into office.

"None are better able or more qualified to make timely recommendations or give direction than our officers, particularly the outgoing president, secretary and the members of the Council, who are continued in office and are thoroughly conversant with all phases of pharmacy and of the Association. Their recommendations, based upon experience and knowledge, serve a useful purpose.

It is for the House of Delegates, representing pharmacy as a delegate body, to consider carefully the recommendations and proposals placed before the members, before they are passed upon, especially those having to do with policy and organization. The House of Delegates is and should be to Pharmacy what Congress is to the Nation. Our profession has many members and individually, we may have many ideas and opinions, and many proposals and theories may be advanced.

"It is necessary that we have a delegate body, representative of pharmacy, to act as a clearing house for the plans and program to be carried out. That is the right way to do things, it is the American way. Between meetings, with your approval, the officers carry on in an understanding way. There is only one more democratic way, that is, to have contact with every one of the men and women who are engaged in Pharmacy. It would be impossible to have all represented at one meeting, and if it were, each could not be given an opportunity to express himself. A near approach to this would be to have the president and secretary of each State Pharmaceutical Association present at the meetings as delegates. They know the thought and the need in their respective states. Such close personal contact and the counsel of these divisional leaders would be valuable.

"During the past year the lack of a definite policy, definite objective and effective form of organization has been voiced frequently as a glaring fault of Pharmacy. This is a challenge to our thinking and our doing. That this organization could have increased the scope of its activities in the past cannot be denied, that it did not, is not to be criticised. Having for its aim and purpose the professional advancement of pharmacy, it is not strange that other organizations were brought into being to deal with the purely commercial side which was becoming an important factor. That situation made it logical for each organization to restrict its scope and function in its own field.

About twenty years ago it was recognized that pharmacy needed a more adequate representative machinery for doing the things, all too long neglected, and a federation of all pharmaceutical organizations was proposed—an affiliation of all State, National, County and Local associations.

"That same need is before us to day, and because we lack a unified force we still remain on the defensive. A fact, which has been repeatedly pointed out—is—that the total number of pharmacists holding a membership in any national organization does not represent a majority of the profession—should cause us to turn our attention seriously to ways and means of correcting that condition.

"I am not certain such a federation or affiliation is feasible, or the best form of organization but, since some State associations look with favor upon it, due consideration must be given it after all the factors pertaining thereto have been analyzed.

'An ideal situation would be one resulting from an awakening of the entire body of pharmacists whereby a majority would become organization-minded and active dues-paying members in our Association and others which serve their interests. To secure the greatest coöperation from pharmacists, we cannot at this time entertain proposals to limit our membership or make it too restrictive. I consider it unwise and impracticable and the means of rendering ourselves less effective as a group, if we avoid our responsibility to all pharmacists or close our doors to their membership. We cannot afford to limit ourselves either in members or influence.

'Fortunately we have recognized our own faults. We have served notice, so to speak, that the AMERICAN PHARMACEUTICAL ASSOCIATION does not approve practices that degrade the standing of pharmacy and will use our influence to keep them out. To do so is our job. We must secure and retain the confidence of the public, the coöperation and aid of those interested in public health and the assistance by legislation. We cannot ignore the conditions which prevail in pharmacy or

disregard our responsibility for some of them. The AMERICAN PHARMACEUTICAL ASSOCIATION should have close contact with all who profess to be pharmacists and represent them. If it is possible to encourage professional practice and ethics among the pharmacists of this country reaching out to them with educational material through a new publication or otherwise it must be done, and it is the duty of this organization to move in that direction.

"No matter what the causes or the compelling forces may be, commercialism is foreign to pharmacy and dangerous to its essential public health purpose. It is altogether possible for the AMERICAN PHARMACEUTICAL ASSOCIATION, with its prestige, its influence and its facilities, to combat it successfully and give direction in the future, if it can have the professional ear and the membership of a majority of those engaged in pharmacy, so it could speak for and through them.

'May we attempt to arouse and awaken sufficient professional interest to accomplish that much?' At no time has there been a greater need for numerical strength to support a worthy cause and at no time have conditions been more unfavorable for securing new members, yet I hold this to be necessary at this time and we should so plan, organize and execute our efforts so that the best results will obtain.

Beyond this, I suggest that no better manual for our guidance can be found than the recommendations which have been presented to the ASSOCIATION by the former presidents in their annual addresses and by the standing committees in reports. For to attempt to do so would be to repeat what has been ably presented. We have only to make a thorough study of this constructive material, coordinate the thoughts and recommendations into a definite program, with a definite policy to meet the demands of to day if it is diligently carried out.

"I have every confidence in the sincerity and the ability of the officers and members of the Council to act wisely and unselfishly. They have served long and well. I am delighted to have the opportunity to cooperate with them and serve you to the best of my ability in the interests of all of Pharmacy.

'In conclusion, may I express to you the hope that a material showing of progressive thought, action and cooperation in all fields of pharmacy may be recorded during the coming year.'

President Costello advised Chairman Day that he had no precedent to go by but would at this time ask Dr. Day to install another member of the Council. Dr. Fischelis automatically became a member of the Council upon his retirement from the presidency. He was duly installed as a member of the Council.

Dr. Rufus A. Lyman addressed the meeting as follows:

I have a token of esteem for presentation to a member from those who know him best. The problem these men had was to find the most proper man to make the presentation. It was desired that the presentation be made by a man who was independent. That was one reason why I was selected because in the seven and twenty years that I have belonged to the AMERICAN PHARMACEUTICAL ASSOCIATION I have never held an office of any kind, not even a chairmanship of a committee.

Continuing Dr. Lyman explained that he is regarded as the Will Rogers of the pharmacy group and he then went on in his traditionally humorous manner to entertain the members by relating additional reasons why he was chosen to make the presentation.

Dr. Lyman at the conclusion of his highly entertaining remarks called upon Dr. Robert P. Fischelis to accept the token which the speaker further explained was presented to Dr. Fischelis by the members of the Mercer County (New Jersey) Pharmaceutical Association. In making the presentation of the beautiful gold watch Dr. Lyman said: Dr. Fischelis when you look into the face of this watch I hope that you will see beyond its hands and the glittering letters the affection of your friends and the admiration of every one who has a connection with pharmacy.

Dr. Fischelis in accepting the gift stated that he was deeply touched by the kindness of the Mercer County pharmacists who had chosen to honor him in this way. He also expressed his thanks to the pharmacists of Oregon and especially the Portland group for many courtesies extended to him and to Mrs. Fischelis during the convention week. The fact that Mrs. Fischelis' grandfather had fought in the Indian Wars in Oregon while he was in the Pacific North West with the forty-niners created a bond of friendship with Oregonians which had been cemented by this meeting.

Dr. Fischelis referred feelingly to the support of many friends in the activities of the past

year and indicated that expressions in correspondence with outstanding pharmacists in all parts of the nation had given him encouragement in undertaking the things he had tried to accomplish. Referring to the necessity for spending much of his leisure time in promoting the affairs of the ASSOCIATION he also paid tribute to the patience and forbearance of Mrs. Fischelis who had been willing to make necessary sacrifices to permit him to serve the ASSOCIATION. Finally he thanked the members and guests in attendance for their part in making the Portland Convention so successful.

Dr. Day remarked that at the time the officers were presented Dr. A. G. DuMez, the editor of the YEAR BOOK, was not present, he invited him to step forward and be presented.

Chairman of the Council, S. L. Hilton, was presented.

Dr. Day believed the cabinet was now complete.

Chairman Fischelis resumed the Chair and called on Secretary Kelly who said: "I wish to express our regret for an unintended, an embarrassing omission, in that the name of a man to whom appreciation is due was not mentioned in the Resolution of appreciation to our hosts and I ask Frank Nau (Portland, Oregon) to rise and let us in theatrical terms, 'give him a hand.' I am sure the president will insist as will all present, that we correct the omission at once by including his name in the published Resolution of appreciation."

Chairman Fischelis, in concluding the session thanked the local pharmacists, particularly Dean A. O. Mickelsen, for the splendid way in which they had handled the details of the convention.

The 83rd Annual Meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION was then adjourned.

It may be necessary to defer the report of the House of Delegates to the next issue of the JOURNAL.

INTERNATIONAL PHARMACEUTICAL CONGRESS, 1885

'A large section of our space is occupied this month with the history of the proceedings of the sixth International Pharmaceutical Congress which held its sessions at Brussels from August 31st to September 5th (1885), inclusive. The event was one of singular interest. *Royalty patronized it*, a chief Minister of State presided over it, *a great City Council feted it*, *foreign governments appointed special delegates to its sessions*, and its proceedings were reported all over Europe. To an English observer all this was, as we have said, interesting and curious, perhaps more interesting and curious to us than to Continental pharmacists who regard their profession from a different standpoint to that which we occupy. The pleasure and advantage of social intercourse, the new ideas suggested and imbibed, and the incidental benefits generally picked up on such an occasion are of the highest value. It is a point for consideration whether the Continental or the English view of pharmacy is the true one — Retrospect of Fifty Years Ago' in *Chemist and Druggist*, September 7th. The report differs from that of this year's Congress but it is interesting to note that in some particulars there is similarity (Italics ours).

DISPENSING IN HOSPITALS

According to *The Australasian Journal of Pharmacy*, the Council of the Pharmaceutical Society of New South Wales has been instrumental in obtaining the cooperation of the New South Wales Branch of the British Medical Association on the question of doctors undertaking dispensing or the supervision of dispensing in public hospitals. The Branch has now intimated its willingness to advise its members that they should not undertake dispensing or the supervision of it in public hospitals where there is a chemist within a radius of two miles from the hospital. This cooperation is particularly gratifying, and may be regarded as the first step in the direction of obtaining dispensing in hospitals for qualified chemists. The position is one which has been causing organized pharmacy a considerable amount of concern for some years. The attitude of the New South Wales Branch is therefore very much appreciated in pharmaceutical circles.

The Australian Trained Nurses' Association has also signified its disapproval of nurses being called upon to undertake the responsibility of dispensing so that, with the active disapproval of both the medical and nursing professions, pharmacists have strong claims for the recognition of their professional qualifications.

EDITORIAL NOTES

LOCAL BRANCHES A PH A

It is hoped to include a revised roster of the A PH A Branches in the succeeding issue of the JOURNAL and the officers are requested to refer to pages XVIII and XIX of the July JOURNAL and mail revisions if necessary to the JOURNAL 2215 Constitution Ave Washington D C—Thank you

REMINGTON MEDAL AWARD AND DINNER

The Remington Medal will be formally awarded to Samuel L Hilton at a dinner which will take place at the Mayflower Hotel Washington D C on the evening of October 19th, at 7 00 P M The function is under the auspices of the District of Columbia Pharmaceutical Association of the District Veteran Druggists Association the District Board of Pharmacy, the members of the faculty of the School of Pharmacy George Washington University, and the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION

Dr A C Taylor 1733 Upshur St N W Washington D C is directing the arrangements and tickets can be reserved for the occasion (The price is \$3 00 per person) A large attendance is expected

TRI-STATE MEETING

The states of Idaho Oregon and Washington held a most successful Tri-State pharmaceutical convention and added immensely to the success of the meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION The duties of the officers did not prevent them from taking part in the meetings but a number failed to register hence it is greatly regretted that their names are not recorded The list of registrants is printed in the August JOURNAL pages 679 and 680 It will please the ASSOCIATION to have their names for record and thanks are extended for the consideration

The name of F C Felter *Pacific Drug Review* was not in the list of record, he was among those in attendance and active in the work of the convention

THE EBERT PRIZE AWARDS

At the Portland meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION Marvin J Andrews was awarded the Ebert Prize

for his work on 'Determination of the Reasonable Permissible Margin of Error in Dispensing' The first Ebert award was made in 1874 to Charles L Mitchell, the Index of the 1874 volume of the PROCEEDINGS does not refer to the Ebert Prize for 1874 nor does the Collective Index 1851-1902 Under "Funds of the ASSOCIATION," YEAR BOOK volume for 1933, it is stated 'The Ebert Prize was awarded for the Year 1874 to Charles L Mitchell' As there was difficulty in finding the report on this, *the first award* search was made with the result that on page 782, of the 1875 volume of the PROCEEDINGS is a comprehensive report and the words of the award are

After full deliberation upon all the above points and considering the labor involved in the experiments of the subject matters of the three papers, the committee awards the Ebert Prize of the AMERICAN PHARMACEUTICAL ASSOCIATION, for the year 1874 to Mr Charles L Mitchell for his essay On the Active Principles of the Official Veratrum

The paper is published in the volume of the PROCEEDINGS for 1874 pages 397-426 Mr Mitchell graduated from the Philadelphia College of Pharmacy in 1872 and in medicine from the Jefferson Medical College, in 1880 He retired from the retail drug business in 1882 and engaged in the manufacture of pharmaceuticals He was one of the founders of Medico Chirurgical College and professor of Chemistry for two years He died in 1910, but his name does not appear under "Obituary" in the Index, these notes therefore may have reference value

The Collective Index for 1851 to 1902 does not list the 'Ebert Prize' under that head and search must be made for the awards under other headings F B Power, PROCEEDINGS for 1878 page 875, J U Lloyd, Volume 31 page 439 The first listing under 'Ebert Prize' is in Volume 55 reference to page 313 Other references may usually be found under—'Committee' Report, or the name of the recipient in connection with the paper presented

USE OF LACTIC ACID FOR NON ALCOHOLIC BEVERAGES

The manufacturers of non alcoholic beverages in Japan will use lactic acid in place of citric acid and tartaric acid both of which

Japan has imported for many years and the demand has been on a steady increase in recent years. This decision has resulted from the recent experiments carried on by Dr. Yasuzo Hattori of the Imperial Hygienic Laboratory at Tokyo at the request of the Japan Non-alkoholic Beverages Association. His conclusion is that lactic acid has a greater power of sterilization and its taste is milder than that of the other two acids.

HUNGARIAN DRUGS

Because of his country's position as the world's largest supplier of botanical drugs, Dr. Peter von Betegh, Hungary, pointed out that officials of the Hungarian government after the war laid down a policy calculated to raise the quality of botanical products. It established agricultural stations under the direction of scientists of high rank, the Hungarian Board of Agriculture maintains a department which is authorized to control the condition and quality of the goods which are in the hands of the collectors as well as those held by the traders. Proper cultivation, collection and preparation of botanical drugs so that they will meet with U. S. P. requirements rests in the hands of a staff of chemists whose services are at the disposal of all branches of the trade. Exports of botanical drugs from Hungary last year totaled 2,300,000 kilos, comprising more than 100 different items—Abstracted from *Oil, Paint and Drug Reporter*, September 9th.

COTTON STRIPPER TESTED IN HARVESTING PYRETHRUM

A cotton stripper altered to harvest pyrethrum will do the work successfully if the flower stalks are reasonably upright, the U. S. Department of Agriculture announced. The Bureaus of Agricultural Engineering and Plant Industry have just finished making tests with such a machine and with a grain binder at points in Maryland and Pennsylvania.

COMMITTEE TO COORDINATE HEALTH ACTIVITIES OF GOVERNMENT

The interdepartmental committee to coordinate health and related welfare activities of the federal government is composed of Josephine Roche, Assistant Secretary of the Treasury, Chairman, Oscar Chapman, Assistant Secretary of the Interior, M. L. Wilson, Assistant Secretary of Agriculture and A. J.

Altmeyer, Second Assistant Secretary of Labor. The president has instructed this committee to include within the scope of its work not only health activities, but closely related welfare activities as well. This Committee is to be composed of physicians and other technically trained persons within the government service to study and make recommendations concerning specific aspects of the government health activities. It is hoped to bring about a complete coordination of the government's activities in the health field.

PERSONNEL CHANGES IN SWEDISH PHARMACEUTICAL CIRCLES

It is announced in *Farm Revy* (Aug. 24, 1935) that King Gustav V has appointed the former head of the apothecary shop "Garnison" in Stockholm, Apothecary C. F. G. Söderberg, to be chief of the Apothecaries' Bureau of the Royal Medicinalstyrelse (the official Swedish medical control). The former bureau chief, Apothecary Ernst Matern, had requested retirement. Mr. Söderberg is a former teacher at the Swedish Royal Pharmaceutical Institute and has been long connected with the State Pharmaceutical Laboratory.

The King has also appointed Apothecary Harold Nilsson as head of the State Pharmaceutical Laboratory. Mr. Nilsson has been a teacher at the Royal Pharmaceutical Institute. Since 1930 he has been an assistant at the State Pharmaceutical Laboratory.

It may be noted that the Swedish pharmaceutical weekly, *Farmaceutisk Revy*, has changed editors, Apothecary A. Welander retiring and Apothecary John Quist taking his place as new editor. Mr. Quist's first issue is the number for the 17th of August (Vol. 34, No. 33).

At a meeting of the Nordiska Specialitetskommission in Stockholm in June it was decided to make up an "extra-pharmacopœia" (in common for the four Scandinavian countries) corresponding to the *Ergänzungsbuch* of the German pharmacopœia and citing test methods for non-official preparations. Among the commissioners are Prof. Baggesgaard Rasmussen, E. H. Madsen and K. A. Jackerott representing Denmark, Apothecary A. Nylander representing Finland, K. L. Schei and F. de Lemos representing Norway and Dr. A. Rising, S. Ernkson and H. Nilsson representing Sweden.—Courtesy Dr. Clifford Leonard and Dr. A. G. DuMez.

PERSONAL AND NEWS ITEMS

In transcribing from *press copy*, inadvertently an error was permitted to pass through uncorrected in this section of the August JOURNAL page 732 name should be Robert Koch While the error will be recognized as such, the occurrence is regretted

The United States has accepted an invitation to be officially represented at a League of Nations Conference on Biological Standardization to convene at Geneva on October 1st. The Department of State has appointed Chairman E Fullerton Cook of the United States Pharmacopœia Revision Committee and Medical Director G W McCoy Director of National Institute of Health United States Public Health Service to represent it at the conference. Chairman Cook advises that responsibilities in connection with pharmacopœial and other duties prevent his acceptance.

The *Industrial and Engineering Chemistry News Edition* of September 10th published a sketch of Dr James H Beal by Julius A Koch. The writer refers to his work in various state and national organizations and in the promotion of legislation construction of the measures and his valuable services in pharmacopœial revision. He speaks of his love of nature and close observation which has resulted in a number of interesting collections, his shells comprise specimens that have made the collection outstanding and known to collectors and students throughout the world. The article refers to his activities in the AMERICAN PHARMACEUTICAL ASSOCIATION. An effort to abstract the sketch would fail in giving due credit hence these brief references are intended only to refer to the published sketch.

President Robert R. Pierce, of W Va Pharmaceutical Association sends his first message as president to the members. The bulletin as usual has been prepared by Secretary J Lester Hayman.

Vice-Chairman C T Gilbert, of the House of Delegates A Ph A visited the American Institute of Pharmacy September 18th he was accompanied by his mother. Among other visitors at the Headquarters recently were Herbert R Woods Evansville Ind. Mr and Mrs T Zimmerman Terra Haute Ind., Mr and Mrs Roger A McDuffie and son Greensboro N C. John S Zinsser, for some time connected with Merek & Co, has been elected president of Sharp & Dohme, succeeding A Homer Smith. John S Zinsser is a son of Frederick G Zinsser—*Courtesy of Mr Smith*

OBITUARY

EDWARD V SHEELY

Edward V Sheely, aged 65 years, druggist and former postmaster of Memphis and guiding light in Memphis plans for the Tennessee Pharmaceutical Association's recent Golden Jubilee Convention was killed August 21st when his automobile was struck broadside by a truck at Huntington, W Va. Mrs Sheely was critically injured, and Edward V Sheely Jr and his wife were severely cut and bruised in the accident. In tribute to the deceased the druggists of Memphis closed their doors for a five minute period during funeral services for Mr Sheely the afternoon of August 24th.

Born in New Oxford Pa, February 14, 1870. Mr Sheely spent his early youth in that city and there received his pre college training. He graduated from the Philadelphia College of Pharmacy in 1892. Two years later he moved to Memphis. During his first three years here he worked for James S Robinson late veteran member of the AMERICAN PHARMACEUTICAL ASSOCIATION and then established a pharmacy at Vance and Lauderdale Streets, which to day after thirty five years is a Memphis landmark.—Data from *Southeastern Drug Journal*

WILLIAM F MICHEL

William F Michel, 61 years old, of Watertown S Dakota died suddenly from heart attack July 20, 1935. The deceased was a force in South Dakota pharmacy circles for many years a former president of the State Pharmaceutical Association and for a number of years its secretary manager. While holding the latter office he established *The Optimist* and continued it until the time of his death. He was fearless in his editorials.

When the AMERICAN PHARMACEUTICAL ASSOCIATION met in Rapid City, Mr Michel took a deep interest in the convention and during recess he was the center of groups of listeners.

SOCIETIES AND COLLEGES.

NATIONAL ASSOCIATION OF RETAIL DRUGGISTS

The National Association of Retail Druggists convenes this week in Cincinnati (week of September 23rd). Among the features are the Drug Show, various conferences, including that on Prescription Economics, U S P and N F Propaganda. U S Senator Millard E Tydings, of Maryland, will be a speaker, others listed are Col Charles H March, of the Federal Trade Commission, R L Swan, E F Kelly, Robert P Fischel. Addresses are scheduled by Dr James M Doran, administrator of Distilled Spirits Institute, and Arthur J Mellott, deputy commissioner of Internal Revenue.

NATIONAL WHOLESALE DRUGGISTS' ASSOCIATION

The prohibition of below cost sales together with other plans for eliminating unfair trade practices, will be among the chief topics of discussion at the convention of the National Wholesale Druggists' Association to be held at the Greenbrier Hotel, White Sulphur Springs, West Va., September 29th to October 3rd. It is understood that Col Charles March of the Federal Trade Commission will attend the convention and may discuss the fair trade practice rules which are being used to govern wholesale druggists.

NEBRASKA

Working in coöperation with the Nebraska Pharmaceutical Association, local druggists, health associations and the local police authorities, state officials are moving to enforce two new drug regulations which went into effect on August 26th. The state department will be able to keep a record of violations under the uniform narcotic law. According to the director, very few druggists have sold narcotics illegally in the state. Another law regulates the sale and dispensation of barbitol, hypnotic or somnific drugs, and will be administered under the state department of agriculture and collections. A plan is being worked out for enforcing the law in cooperation with state pharmaceutical and medical associations.

Will Brookley, of the Nebraska Pharmaceutical Association, was a visitor at the AMERICAN INSTITUTE OF PHARMACY on September 20th.

MONTANA

Montana Pharmaceutical Association elected the following officers: *President*, George W Sparrow, Anaconda, *First Vice President*, Charles A McFarland, Helena, *Second Vice President*, Leonard Morrow, Fort Benton, *Third Vice President*, George M Gossman, Dillon, *Treasurer*, Charles Adams, Lodge Grass, *Secretary*, J A Riedel, Boulder.

WISCONSIN DRUG SHOW

Sponsored by the Wisconsin Pharmaceutical Association and the Milwaukee County Association, a state wide drug show will be held October 28th to 30th, at the Schroeder Hotel to mark the 55th anniversary of organized pharmacy in Wisconsin.

ALUMNI LUNCHEON, PHILADELPHIA COLLEGE OF PHARMACY

The Alumni of Philadelphia College of Pharmacy and Science gathered together at a luncheon on August 9th, at Portland, Ore about fifty of their number were present.

ASSOCIATION OF MILITARY SURGEONS OF THE UNITED STATES

The 43rd annual meeting of the Association of Military Surgeons of the U S will be held at the Waldorf Astoria, New York City, October 3rd-6th. Col J W Grissinger is chairman of the Committee on Arrangements.

INTERNATIONAL HOSPITAL ASSOCIATION

Dr Sidney Lamb, of Liverpool, has been elected *secretary general* and *treasurer* of the International Hospital Association.

HOWARD UNIVERSITY

Howard University, Washington's Government subsidized center of Negro learning and culture, has entered on its 68th year. In course of construction now is a new chemistry building which, when completed and equipped will have cost about \$626,000 00.

The nine divisions of the University are the Graduate School, the College of Liberal Arts, the School of Engineering and Architecture, the School of Music, the School of Religion, the Law School, the College of Medicine, the College of Dentistry and the College of Pharmacy.

LEGAL AND LEGISLATIVE

MARYLAND LEGISLATION

The pharmacy organizations of Maryland have mailed out the following information to physicians through its official publication—*The Maryland Pharmacist*

The Maryland Pharmaceutical Association, in cooperation with the Baltimore Retail Druggists' Association, takes real pleasure in the success of the pharmaceutical legislative program. Several bills were introduced in the General Assembly and passed for the purpose of bettering pharmaceutical service and to more adequately control the manufacture and distribution of drugs, medicines and poisons.

Specifically the new laws accomplish the following:

Veronal, Phenobarbital and other salts of barbituric acid may only be obtained on prescription.

Poisons may be sold only by registered pharmacists in strict conformity with the record keeping provisions of the law. The State Board of Health is empowered to restrict the sale of poisons to prescriptions when the public welfare so warrants.

'All manufacturers of drugs, medicines, toilet articles and dentifrices must operate under a permit issued by the Maryland Board of Pharmacy, and the technical qualifications of persons so engaged must be approved by the Board.

'All drug stores must possess at least the minimum of professional and technical equipment which the Board of Pharmacy prescribes.

'Medicine Shows' and Patent Medicine Shows' are made unlawful. Unsafe and indiscriminate distribution of drug samples is prohibited.

It is the belief of these associations that these new laws will meet with the approbation of the medical profession and that they will contribute greatly to a higher professional standard in the manufacture and distribution of drug products.

HIGHER RETAIL ETHICS

Consolidated Brooklyn Retail Pharmacists Inc. Brooklyn has been chartered by the Secretary of State at Albany as a membership corporation without capital stock. The particular objects and purposes of the corporation as stated in its certificate are:

To work together for the purpose of raising the standards and ethics of retail pharmacists

and druggists, to improve the working conditions of retail pharmacists and druggists, to endeavor to prevent unfair competition and unfair trade practices by retail pharmacists, druggists or others, to propose beneficial legislation for retail pharmacists and druggists and to cooperate with each other for the improvement of business in retail pharmacies and/or drug stores, and to do such further acts or things as may carry into effect the foregoing purpose. George Gottesman, W. W. Sitterley, Percy Goldman, George L. Chudow, J. M. Sarrett, Boris S. Prial, Brooklyn, are the incorporators. Alfred S. Perlstein, 66 Court St., Brooklyn, is attorney for the association.

MONTHLY REPORTS ON RETAIL DRUG STORE SALES

The Department of Commerce expects to publish a series of monthly reports on sales in retail drug and grocery stores. The initial reports in the series will be confined to the states of Illinois, Indiana and Wisconsin, but the department hopes to extend them later to cover every state in the Union. The figures published are expected to reveal general trends, inasmuch as the stores which have agreed to cooperate cover both rural and urban areas.

Director Claudius T. Murchison, of the Bureau of Foreign and Domestic Commerce, delivered an address at the Boston Conference on Distribution, September 24th, on "Research Needs and Activities in Field by Distribution." The remarks of Director Murchison were timely. A few lines from the conclusion of the address are quoted:

Whatever be the immediate aim of given research activities in the field of distribution there should be in all of them implicit recognition of the essential unity of purpose which provides all agencies and all functions in the field of distribution. The increased effectiveness of any agency is a contribution to the welfare of all agencies.

CHINESE DEMAND FOR AMERICAN MEDICAL PREPARATIONS

Chief C. C. Concanon, of the Commerce Department's Chemical Division, states that China is becoming increasingly important as a market for American medicinals. In 1924 China stood seventh among foreign countries as a producer.

BOOK NOTICES AND REVIEWS.

The Structure and Composition of Foods By ANDREW L. WINTON, Ph. D., and KATE BARBER WINTON, Ph. D. This is Volume II of the valuable work—Vegetables, Legumes, Fruits, with more than 300 illustrations. The first volume dealt with Cereals, Starch, Oil Seeds, Nuts and Forage Plants. The publishers are John Wiley & Sons, Inc., the price of Volume II is \$15.00. The following is from the Preface: "The chemical sections of this volume, in addition to conventional analyses, record epoch making discoveries, largely recent, on the occurrence and constitution of lesser known constituents such as organic acids, pectins, natural flavors, colors (notably chlorophyll, carotenoids, lyochromes and anthocyanins), the chemical substances classed as vitamins, and minor mineral constituents. Complete unanimity of conclusions on certain points can hardly be expected, nevertheless, the matter available, on the whole, fills with remarkable completeness the gaps in the literature."

The sections with illustrations on microscopic structure represent the authors' original work in large part here recorded for the first time. The text covers 855 pages, the index 50 pages, careful attention is given to the inclusion of references. This authoritative work will be welcomed by chemists and libraries.

Pharmacists will find *Merck Medical Memoranda*, published monthly of value. It is issued in the form of cards and, no doubt, physicians consider the Memoranda useful references. Twenty five reports are issued monthly. Data from a card will explain, for example, Anemia, Therapy, the treatment is given, the diet and a reference made to articles bearing on the subject. The annual subscription is \$3.00.

Drug Standards Manual. The 1935 revised edition of the Manual, including Tolerances and Methods of Analysis is now ready for distribution.

This compilation, prepared by the combined

pharmaceutical contact committee of the American Drug Manufacturers' Association and the American Pharmaceutical Manufacturers' Association, with the cooperation of the Food and Drug Administration, United States Department of Agriculture, comprises seventeen monographs on "Ampuls," thirty six monographs on "Compressed Tablets," and eighteen monographs on "Hypodermic Tablets." The price of the Manual is \$3.00. It may be obtained from the American Drug Manufacturers' Association and the American Pharmaceutical Manufacturers' Association.

DICTIONARY OF AMERICAN BIOGRAPHY

"The Council of Learned Societies kept in its hope for a quarter of a century the preparation of this work and finally found the way to carry that hope into a fruition that compares favorably with Great Britain's Dictionary of National Biography in the scholarly authority of the articles, in the factual accuracy, in the style of presentation and in the format and letterpress of the volumes. The whole patriotic undertaking is a credit to American learning. The sixteenth volume was published recently and the twenty volumes will be completed next year. The end now in sight praises the beginning of this high venture."

Among many known to pharmacy whose biographies have appeared are Samuel P. Sadtler, Charles Rice.

The AMERICAN PHARMACEUTICAL ASSOCIATION is indebted to Drs. Glenn L. Jenkins and A. G. DuMez for an autographed copy of "Quantitative Pharmaceutical Chemistry."

J. Leon Lascoff has presented the library of the AMERICAN PHARMACEUTICAL ASSOCIATION with a "Physicians' Pocket Manual of Useful Drugs, Chemicals and Preparations," prepared by the U. S. P. and Propaganda Committee of the New York State Pharmaceutical Association.

PHYTO-PHARMACY.

The author, who is Professor at Louvain University, suggests that the pharmacist, by his training in chemistry and botany, is qualified to supply fungicides and insecticides, and give advice on the treatment of plant diseases. He thinks that a study of vegetable pathology, mycology and entomology should enable a pharmacist to replace the seedsman as a more intelligent supplier of certain products for use in horticulture and agriculture.—V. ESTIENNE, *The Pharmaceutical Journal*, August 31, 1935.

NOTICE TO CONTRIBUTORS TO THE JOURNAL AMERICAN PHARMACEUTICAL ASSOCIATION

The following notice has been prepared from comments received from members of the Board of Review of Papers and of the Publication Committee

Manuscripts should be sent to Editor E. G. Eherle, 2215 Constitution Ave., N. W., Washington, D. C.

All manuscripts should be typewritten in double spacing on one side of paper 8 1/2 x 11 inches, and should be mailed in a flat package—not rolled. The original (*not* carbon) copy should be sent. The original drawings—not photographs of drawings, should accompany the manuscript. Authors should indicate on the manuscript the approximate position of text figures. All drawings should be marked with the author's name and address.

A condensed title running page headline, not to exceed thirty five letters, should be given on a separate sheet and placed at the beginning of each article.

The method of stating the laboratory in which the work is done should be uniform and placed as a footnote at end of first page, giving Department, School or College. The date when received for publication should be given.

Numerals are used for figures for all definite weights, measurements, percentages, and degrees of temperature (for example 2 Kg., 1 inch, 20.5 cc., 300° C.). Spell out all indefinite and approximate periods of time and other numerals which are used in a general manner (for example one hundred years ago, about two and one half hours, seven times).

Standard abbreviations should be used whenever weights and measures are given in the metric system e. g., 10 Kg., 225 cc., etc. The forms to be used are cc., Kg., mg., mm., L. and M.

Figures should be numbered from 1 up, beginning with the text figures (line engravings are always treated as text-figures and should be designated as such) and continuing through the plates. The reduction desired should be clearly indicated on the margin of the drawing. All drawings should be made with India ink, preferably on white tracing paper or cloth. If coordinate paper is used, a blue lined paper must be chosen. Usually it is desirable to ink in the large squares so that the curves can be more easily read. Lettering should be plain and large enough to reproduce well when the drawing is reduced to the width of a printed page (usually about 4 inches). Photographs intended for half tone reproduction should be securely mounted with colorless paste.

"Figure" should be spelled out at the beginning of a sentence, elsewhere it is abbreviated to Fig., 'per cent'—2 words.

The expense for a limited number of figures and plates will be borne by the JOURNAL, expense for cuts in excess of this number must be defrayed by the author.

References to the literature cited should be grouped at the end of the manuscript under the *References*. The citations should be numbered consecutively in the order of their appearance (their location in the text should be indicated by full sized figures included in parentheses). The sequence followed in the citations should be: Author's name (with initials), name of publication, volume number, page number and the date in parentheses. Abbreviations for journals should conform to the style of *Chemical Abstracts* published by the American Chemical Society.

(1) Author A. Y. *Am. J. Physiol.* 79: 289 (1927)

Papers presented at the Sections of the AMERICAN PHARMACEUTICAL ASSOCIATION'S annual meeting become the property of the ASSOCIATION and may at the discretion of the Editor be published in the JOURNAL. Papers presented at these Sections may be published in other periodicals only after the release of the papers by the Board of Review of Papers of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

The Editor will appreciate comments from Board of Review and Committee on Publication members, authors and others interested.

On account of Pharmacopoeial, National Formulary and ASSOCIATION matter, the number of pages in this section has been limited, in succeeding issues it is hoped to have the usual number of pages, this applies also to the Roster.

Tri-State Association Banquet at Portland—Idaho Oregon and Washington groups with members of their families and friends

CARL AUGUST ROJAHN

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL XXIV

OCTOBER 1935

No 10

CARL AUGUST ROJAHN, HONORARY MEMBER OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

Prof Dr Carl August Rojahn, who was elected honorary member of the AMERICAN PHARMACEUTICAL ASSOCIATION at the Portland meeting, was born September 23, 1889, in Duisburg, Germany. He served a 3-year apprenticeship in the Pellican Apotheke, Dueseldorf, where he passed the examinations. He studied in Marburg and then in Braunschweig, where he passed further examinations and, in Rostock, those for chemist. Engaged in research on Pyrazol-Ketone, he received the degree of Doctor of Philosophy, with honor.

He was military chemist and then assistant at the Chemical Institute of the University of Frankfurt from 1917 to 1919, later, assistant at the Pharmaceutical Institute in Frankfurt. He continued similar work at the Pharmaceutical Institute of Braunschweig and, thereafter, was named professor and head of the Pharmaceutical Division of the Chemical Institute. He was then called to Freiburg and a year later elected professor and divisional director at the Chemical and Pharmaceutical Institute of the University of Halle, in 1929, he was named director of the Institute.

Dr Rojahn has been very active in research, pharmaceutical analyses and investigations of various galenicals, all of his work is done carefully and thoroughly and is marked by his personality. He is author of the revised edition of Autenrieth and of the volume on Pharmaceutical Practice.

H Beckurts, in the foreword of the German YEAR BOOK for 1924, refers to Dr Rojahn as a former assistant, whom he had secured as co-worker for the division of Chemistry of Foods. Since 1928 he has been editor of the YEAR BOOK and the value of this work has been enhanced by the many sources of general information which Dr Rojahn has at his command. He is constantly interested in what ever serves the profession and German pharmacy is marked by his activities.

Dr Rojahn has been honored with the Prussian life-saving medal awarded for the saving of life and risking his own. Opportunity is taken to welcome the Honorary Member

DEDUCTIONS FROM THE PAPERS OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

MANY papers of the Scientific Section of the AMERICAN PHARMACEUTICAL ASSOCIATION related to Pharmacopœial and National Formulary subjects, not only contributing to the standards, but as preparatory work for establishing and improving them, if possible. A number of the papers were prompted by the conference on the study of opium assays by the Committee upon Uniform Method of Opium Assay, which has been working under the auspices of the Health Committee of the League of Nations since 1931. It is hoped to present some of these in an early issue of the JOURNAL. Quite a few dealt with improved assay and standardizing methods, ergot and antiseptics were among the outstanding subjects. The list shows a studiously prepared program and the phases to which the contributors devote careful study and investigation, there is no desire to place the value of the research of one above the other, but to briefly express appreciation for the work reported at these sessions.

The Section on Practical Pharmacy considered papers on improved methods of preparation and dispensing, and quite a number added interest to the sessions by papers dealing with various phases of hospital pharmacy and prescription practice.

The Section on Education and Legislation gave considerable time to the study of fair methods of practice and business conduct. The public attitude to the retailer and the relationship of other professions with that of pharmacy proved of interest.

The Section on Commercial Interests devoted time and attention to uniformity in prescription pricing, the prescription department, publicity, drug store methods, the effect of Fair Trade Acts, the place of the pharmacist in the community and the commercial training in business and educational institutions.

Seldom has a more interesting program been presented by the Section on Historical Pharmacy. A number dealt with early materia medica and pharmacists of earlier periods, several of the papers have been published and it is interesting to note that a pharmacist, David Henshaw, was a Secretary of the Navy, copy has been made of an early engraving which may be found in this issue of the JOURNAL.

As heretofore stated, there is no desire to valueate the papers, the purpose of the comment is to give credit to all who made the interesting sessions possible, other divisions of the meeting will be given consideration in succeeding issues and in the meantime some of the papers will be published.

EDUCATION OF THE PUBLIC IN FAIR TRADE PRACTICES

IT HAS been said in these columns that the underlying motive of National Pharmacy Week is the education of the public relative to the mission and service of pharmacy. This includes also the possibility of the votaries deriving a living income by rendering service and that the pharmacist should not be subjected to the unfair methods which are practiced by certain activities and have become more or less established, for thereby the professional man and the small dealers, as well

as the community, suffers, advancement in education is essential to good public health service and depends on the success of those engaged in its divisions

Senator Millard Tydings, at the meeting of the National Association of Retail Druggists, voiced a vigorous defense of the demand of retailers for stabilization of the activity. It is evident from his remarks that, in his opinion, regulatory legislation should be enacted.

The subject of fair practices has been studied and the viewpoints discussed by various organizations of the drug industries, but the conclusions and methods for making regulations practical and effective present as great difficulties as the study of the conditions which make legislation necessary. The subject is being carefully studied and a general procedure has been formulated, using as a basis, in part, legislation that has been enacted, and the successful results by the committee will contribute an outstanding service to the public.

The coordinated divisions are concerned in the success. President A. Kiefer Mayer, of the National Wholesale Druggists' Association, said, in substance, "the retailers' interests are our interests as an unwritten by-law of the Association," he emphasized the necessity for sound distributive practices which will give the retailers rightful consideration and show the wholesalers a fair margin for their services. He urged support for manufacturers who are following policies of distribution which are legally sound and recognize both the essential service and the economic necessity of the wholesaler. A circumspection shows the concern of all divisions and should result in a working together with thoughtful consideration of those served. The message of the comment is to work coordinately in educating the public relative to their interest in bringing about honesty and fairness in all activities.

THE RELATIVE POSITIONS IN MATERIA MEDICA OF INORGANIC, SYNTHETIC ORGANIC AND NATURAL ORGANIC SUBSTANCES

President Roy Gardner, in an address to Section "O," Australian and New Zealand Association for the Advancement of Science, said he felt "very definitely that this is a time when a general broadening of outlook in connection with scientific matters is urgently required, and it behooves scientific workers of all ranks and in all divisions of science to make an earnest effort to see their own positions in proper perspective."

Quoting other portions of his address—"Science is very young, but we of the present generation, being ourselves just too young to have taken part in the early struggle of science for recognition, can very easily forget the fact and overlook its implications. It is well for us to remind ourselves occasionally that, for instance, less than two ordinary lifetimes have elapsed since the isolation of the first alkaloid."

Concluding his address he reminded his hearers that "it is vitally necessary to consider not only the growth of science, but also the relationship of science to other aspects of human life. There are not lacking those who blame the growth of science for most of the world's present troubles, on the other hand, we are told that the remedy lies in more science. The truth seems to be that, while science should, and must, continue to go ahead, civilization in its other aspects must adjust itself to that progress—must use the fruits of progress properly—or the result will be chaos." In his opinion "it would be conducive to the necessary adjustment for those who

best understand science—the scientific workers themselves—to interest themselves more in fields of work other than the scientific.” “Pharmacy,” he said, “is an occupation that lies on the border-line between science and commerce. Those pharmacists who take seriously their duty to the world are well placed for obtaining an enlightened view of science on the one hand and of economic and ethical considerations on the other.” He appealed to them to take such a view and to act accordingly. To some, such a remark may appear out of place here, but he did not take that view. Pharmacy as a field of work dealing with health has its own special responsibility, and, in addition, a share of the general responsibility for watching the growth of Science, and seeing that the world makes a right use of it for the benefit of mankind generally.

THOUGHTS FROM AN ADDRESS BEFORE WISCONSIN STATE PHARMACEUTICAL ASSOCIATION BY RALPH M. CARTER, M.D.*

The pharmacist does not carry his large and heterogeneous stock because he wants to but just because the public demands it and the very physician who criticizes the pharmacist the most would in all probability be one of the last ones who would be willing to do without the many services of the ordinary drug store. However on the other hand if a pharmacist really desires prescription business he should take a professional attitude toward this business, and see that his prescription department is thoroughly equipped and conducted in an ethical manner.

Both professions must try to understand each other's problems and by means of inter professional meetings and relationships gradually work out a solution which is satisfactory to both sides. This cannot be accomplished over night but I feel that with earnest effort on both sides it can eventually be done. To fulfil the task requires patience, understanding, tolerant minds, education and last but not least so far as is possible a return to ancient ideals. —*Wisconsin Druggist* for October

* President elect of Wisconsin State Medical Association

This window was arranged by Frank Nau, Pharmacist of Portland; greetings are extended to the AMERICAN PHARMACEUTICAL ASSOCIATION in lower right hand frame. Chronology shown in the center.

(To be revised)

THE QUESTION OF ASSAYING ERGOTOCIN, THE NEW ERGOT PRINCIPLE *^{1 2}

BY EDWARD E SWANSON, CHESTER C HARGREAVES AND K K CHEN

Ergotocin is the new ergot principle isolated by Kharasch and Legault (1) in collaboration with Adair and Davis (2). It melts with decomposition at 155° C, has the probable empirical formula of $C_{21}H_{27}O_3N_3$, and forms easily soluble salts such as the maleate. In a pharmacological paper by Davis, Adair, Chen and Swanson (3), evidence has been presented that the action of ergotocin is different from that of ergotamine or ergotoxine, and it should therefore be standardized by newly developed methods. The substance has a specific and prompt oxytocic effect upon the postpartum human uterus, and offers therapeutic possibilities in obstetrical practice. The present paper is concerned with the comparison of six different methods used in our laboratories for the examination of ergotocin—the polarimetric, the colorimetric, the U S P cock's comb, the isolated rabbit's uterus, the postpartum dog's uterus, and the postpartum human uterus. In all instances, ergotocin maleate was employed. As shown in Table I, a total of 35 lots were assayed. Those numbered 1, 2 and 3 were repeatedly purified and set aside as laboratory standards, those numbered 5, 7, 14, 15, 16, 17, 18, 19, 21, 24, 25, 27, 31, 33, 34 and 35 were factory lots for marketing, and the remaining ones were made by modified processes and subjected to similar tests. The majority of the samples were assayed by three or four methods, only four lots being standardized by the six methods. The authors owe their indebtedness to Drs Fred L Adair and M Edward Davis, Department of Obstetrics and Gynecology, University of Chicago, for the clinical assay which was carried out by a method developed in their clinic (4), to Dr E C Kleiderer for the polarimetric examination, and to Mr A N Stevens for the colorimetric determination.

RESULTS

1 Isolated Rabbit's Uterus Method—Unlike ergotamine and ergotoxine, ergotocin stimulates the isolated rabbit's uterus in dilute concentrations. The response of the mature organ appears to be proportional to the dose, which fact may be utilized for the quantitative evaluation of the product, just as the isolated guinea pig's uterus has been used for the assay of posterior pituitary extracts. Figure 1 shows a typical example of the experiments. It may be interesting to mention here that all the lots showing 100 per cent potency by this method proved to be clinically satisfactory.

In a previous communication (3), it has already been emphasized that ergotocin does not antagonize or inhibit the action of epinephrine, so that the well-known

* Scientific Section A PH A Portland meeting 1935

¹ From the Lilly Research Laboratories, Indianapolis

Eli Lilly and Company introduced this new ergot principle under the name of *Ergotrate*

Broom-Clark method (5) is useless in determining its potency. On the contrary, the effect of ergotoein is diminished after the previous application of ergotamine, such as on the isolated rabbit's intestines. The same can be demonstrated on the

isolated rabbit's uterus after ergotamine, as shown in Fig 2. In fact, ergotocin can almost take the place of epinephrine in the performance of the Broom-Clark test.

2 U S P Cock's Comb Method—Using ergotocine ethane sulphonate as the standard, the first three lots of ergotoein proved to be 24 to 43 per cent more potent, but subsequent factory lots showed the same activity as the standard, with the exception of one (lot No 34) which was 12 per cent in excess. In no instance was ergotoein maleate found to be weaker than ergotocine ethanesulphonate, gram for gram.

3 Polarimetric Method—In aqueous solution, ergotoein maleate is dextrorotatory and has a specific rotation $[\alpha]_D^{25}$ of about $+52^\circ$. From Table I, it may be noted that lots having a specific rotation $[\alpha]_D^{25}$ less

than $+50^\circ$ were correspondingly low in physiological potency. The highest reading ever recorded was $+55.4^\circ$. Only in one case (lot No 6) did the optical rotation deviate from the biological assay.

4 Colorimetric Method—The Smith colorimetric method (6) with *p* dimethyl amino-benzaldehyde can be similarly applied to ergotoein. The readings by this method, as shown in Table I, check within 10 per cent with the results obtained by

Fig 1—An example of ergotocin assay by the isolated rabbit's uterus method

Fig 2—Absence of inhibitory action of ergotocin over epinephrine on isolated rabbit's uterus and diminution of ergotocin action by previous use of ergotocine

the isolated rabbit's uterus method, only in one case (lot No 14) the difference is greater, that is 17 per cent.

5 Postpartum Dog's Uterus Method—The technique of this method has been described by one of us (E. E. S.) (7). The results obtained designate the minimal

effective dose given either by vein or by a stomach tube. In the few tests carried out, the data are on the whole confirmatory of those by other methods (Table I)

TABLE I—ASSAY OF ERGOTOCIN MALEATE BY VARIOUS METHODS

6 *Postpartum Human Uterus Method*—This constituted the ultimate and specific test for each lot of ergotocin. Although an amount of 0.4 mg. by mouth frequently produced more than the minimal response, this arbitrary dose usually gave rise to definite results in those individuals who were less suitable to the drug. A typical response meant a prompt tetanic contraction in 7 to 8 minutes, followed by rhythmic contractions with an increase in tone, lasting for more than 2 to 4 hours. According to Davis, Adair and their associates (2), about one-half of the multiparous patients can serve as testing subjects.

DISCUSSION

In all respects, the isolated rabbit's uterus method yields numerical figures which are most helpful to the chemist. The oxytocic action typifies ergotocin and eliminates ergotamine and ergotoxine, and the prolonged rhythmic contractions distinguish it from histamine and tyramine, both of which cause brief responses. One can, therefore, regard the isolated rabbit's uterus method, the simplest laboratory test, with considerable degree of specificity. To insure fully the therapeutic value of the product, a clinical assay should be carried out. The postpartum dog's uterus method appears to be less sensitive than the clinical method. The remaining three tests are essential for confirmatory purposes, although they are of secondary importance on account of their lack of specificity. From the above data, it may be suggested that every lot of ergotocin should be first examined polarimetrically, assayed colorimetrically and physiologically by the isolated rabbit's uterus method, and finally, tested clinically. This will result in a uniform product for medical use.

The authors believe that the same methods, in addition to the analytical and chemical, will settle the question of identity or difference between ergotocin on the one hand and the other newer substances from ergot on the other, such as sensibamine of Chinoin Gyógyszer és Vegyeszeti Termékek Gyára, R. T. (8), ergoclain of Kussner (9), ergometrine of Dudley and Moir (10), ergostetrine of Thompson (11), and ergobasine of Stoll and Burckhardt (12) and Jacobs and Craig (13). Comparisons should be made, of course, with the same salt and under the same conditions.

SUMMARY

Thirty-five lots of ergotocin were compared by six methods of testing: the isolated rabbit's uterus, the U. S. P. cock's comb, the polarimetric, the colorimetric, the postpartum dog's uterus and the postpartum human uterus methods. With a few exceptions, the results by the different procedures appear to confirm one another.

Ergotocin may be assayed by the isolated rabbit's uterus method, supplemented by the clinical method. Polarimetric and colorimetric tests may furnish preliminary information concerning the purity of the product, but should always be confirmed by physiological and clinical experiments.

In the light of our present knowledge, the U. S. P. cock's comb method is not specific enough for the assay of ergotocin. The Broom-Clark method is entirely useless for the same purpose.

DRUG EXTRACTION V THE EXTRACTION OF BELLADONNA ROOT WITH GLYCERINIC MENSTRUUA *¹

BY WILLIAM J HUSA² AND LOUIS MAGID

Tests were carried out to determine the efficiency of various glycerin-alcohol-water mixtures in the extraction of belladonna root

EXPERIMENTAL PART

100 Gm portions of belladonna root in No 40 powder were percolated by Type Process B with four different menstrua: (A) alcohol 5 vol—water 1 vol, (B) alcohol 425 vol—water 100 vol—glycerin 75 vol, (C) alcohol 325 vol—water 200 vol—glycerin 75 vol, and (D) alcohol 200 vol—water 100 vol—glycerin 100 vol. The preceding menstrua constituted Menstruum I, 100 cc being used, a mixture of alcohol 5 vol—water 1 vol was used as Menstruum II. In each case the drug was moistened with 60 cc of Menstruum I, and allowed to macerate for 6 hours before packing. The drug moistened with Menstruum A occupied 250 cc after packing while with Menstrua B, C and D the volume after packing was 265 cc. After packing, maceration was allowed to proceed for 24 hours. The percolates were then collected in three fractions, 80 cc, 100 cc and 300 cc, respectively. The first 80 cc was collected at the rate of 10 drops per minute and the remainder of the percolate at 20 drops per minute.

TABLE I—EFFECT OF VARIOUS GLYCERINIC MENSTRUUA ON THE EXTRACTION OF POWDERED BELLADONNA ROOT

Percolate	Grams of Alkaloid in Various Fractions of Percolate Menstruum			
	A	B	C	D
80 cc	0.429	0.420	0.372	0.337
100 cc	0.052	0.066	0.088	0.092
300 cc	0.000	0.000	0.018	0.042
Totals	0.481	0.486	0.478	0.471

DISCUSSION OF RESULTS

The results in Table I show that glycerin retards the extraction of the alkaloids of belladonna root. The retardation increases with increasing concentration of glycerin and with decreasing concentration of alcohol. The results of the tests with glycerinic menstrua uphold the general opinion that glycerin does not aid in the extraction of alkaloidal drugs. Firlas (1) has stated that the presence of glycerin in the menstruum does not affect the amount of alkaloids in fluid extracts of cinchona, hydrastis and ergot. Scoville (2) showed that glycerin in the men-

* Scientific Section, A. P. H. A., Portland meeting 1935

¹ This investigation was aided by a grant from the AMERICAN PHARMACEUTICAL ASSOCIATION Research Fund

² Head Professor of Pharmacy, University of Florida

Distillation of the phenol from 2.5-Gm samples and titration of an aliquot of the distillate yielded

5.34 and 5.37 per cent phenol w/w

CAMPHORATED PHENOL

A sample of camphorated phenol (14) was prepared to contain 32.71 per cent phenol by weight. Suitable assay samples when extracted and assayed in the same manner as phenolated oil yielded

32.49, 32.31, 32.46, 32.38 and 32.35 per cent phenol w/w

PHENOL OINTMENT

An ointment of phenol (15) prepared to contain 2.47 per cent phenol by weight yielded results as follows when samples were assayed as described under phenolated oil

2.34, 2.32, 2.35 and 2.38 per cent phenol w/w

Samples assayed by the method proposed for inclusion in the U. S. Pharmacopœia XI (16) which consists of heating weighed samples at 115° C for 1½ hours and calculating the loss in weight as per cent phenol yielded

3.39, 3.16, 2.55 and 4.42 per cent phenol by weight

Two samples heated for an additional hour at 115° C continued to lose weight. Samples of ointment base heated under the same conditions lost weight as follows

0.44, 0.075, 1.04 and 0.35 per cent

It is evident that some of the base volatilized on heating, and that the method proposed for inclusion in the Pharmacopœia is unsatisfactory.

SUMMARY

1. A number of official phenols containing preparations have been assayed by a modified Koppeschaar method.

2. Glycerate of phenol and phenolated solution of iodine can be assayed directly for phenol after dilution without separating the phenol.

3. Camphorated phenol, phenolated oil and ointment of phenol can be assayed satisfactorily after extraction of the phenol with water.

4. The method of assay for ointment of phenol proposed for inclusion in the U. S. Pharmacopœia XI is subject to variations due to the volatility of the constituents of the ointment base.

DATURIC ACID^{1,2}BY RALPH W. CLARK³

The name daturic acid was first applied by Gérard in 1890 to an acid obtained from the oil of the seeds of *Datura Stramonium* L. to which he assigned the formula $C_{17}H_{34}O_2$ (1). The pronouncement was received with skepticism because the existence of a homologue of acetic acid with seventeen carbon atoms, though previously made, had also been denied.

Thus Chevreul as early as 1811 had isolated an acid, m. p. 50–60°, from lard to which he assigned the name *acide margarique* (2). However, he admitted that the existence of this acid was not as certain as that of either stearic acid or oleic acid (3). Liebig, in 1840, expressed the view that margaric acid is a combination of oleic and stearic acids (4). Varrentrapp (5), in the same year, obtained like analytical results. Like Redtenbacher (6), he prepared his margaric acid by distillation of stearic acid.

Fremy (7), in 1840, also claimed that the margaric acid obtained by Felouze and Boudet in 1839 from palm oil was identical with a new acid obtained by him from palm oil which he named palmitic acid. This viewpoint was supported by Stenhouse (8). Laurent and Gerhardt (9) held stearic and margaric acids to be different physical modifications of the same acid, $C_{17}H_{34}O_2$, comparable to "l'acide tartrique" and "l'acide metatartrique."

New direction was given in 1851 to the investigation of fatty acids by Heintz (10) who effected a separation of the free fatty acids by fractional crystallization. He claimed to have isolated margaric acid, m. p. 60°, from human fat. A year later (11) he reported margaric acid, m. p. 60°, as principal constituent of spermacei. However, in the same year, 1852, he pointed out in connection with his investigation of mutton-tallow (12) that palmitic and stearic acids yield mixtures with the properties of new acids. These mixtures, could not be resolved into the individual acids by recrystallization, but only by fractional precipitation by means of magnesium or barium acetate. He therefore regarded margaric acid as a mixture of one part stearic acid with nine or ten parts of palmitic acid. He even went so far as to express the opinion that fatty acids with an uneven number of carbon atoms did not occur in natural fats. All occurrences of margaric acid previously reported he regarded as mixtures of palmitic and stearic acids. The so-called margaric acid found by Collet (13) he recognized as palmitic acid (14).

Such was the state of affairs with reference to a fatty acid with seventeen carbon atoms when daturic acid was discovered. Hence its existence as a chemical individual was questioned.

A new chapter in the history of daturic acid was opened up in 1912 when Meyer and Beer (15) (after Meyer and Eckert (16) had obtained daturic acid from coffee bean oil), pointed out that their daturic acid, obtained upon fractional crystallization of the lithium salts of the fatty acids of datura oil, was identical with Krafft's synthetic margaric acid. The melting point of their acid, 59.5°,

Fig 1 —Melting points of fatty acids and their methyl esters. Curve I Fatty Acids Having an Even Number of Carbon Atoms, II Odd Number, III Methyl Esters of Fatty Acids Having an Even Number of Carbon Atoms, IV Odd Number. The Curves were prepared from data obtained from Reid College Organic Chemistry 223 and 290 (1929) Lowkowitz Chem Tech Fats Oils and Waxes 1 117 (1921) Levenne and Taylor *J Bio' Chem* 69 921 (1924) Beilstein Handbuech der Org Chem ' 2 7-186 (1929) and earlier editions International Critical Tables. A great variation in melting points was observed in the literature mentioned above. The curves were prepared from most frequently appearing melting points and averages of melting points from the five sources.

remained unchanged when a mixed melting point was taken. In the introduction to their report, the authors review the literature concerning acids with an odd number of carbon atoms reported since the pronouncement by Heintz. They point out that upon repetition of most of the work, careful fractionation of the reported acids resulted in the separation of acids with higher as well as lower melting points. Hence no confidence can be placed in the occurrence of heptadecylic acid in either animal or vegetable kingdom.

Boemer and Limprich found daturic acid to agree with synthetic heptadecylic acid in all its properties (17). Ruttan (18) also prepared heptadecylic acid artificially. In 1916 Jacobson and Holmes (19) obtained from alfalfa seed oil an acid which melted at 59.6° to 59.8° , and had a neutralization value of 207.5, hence corresponding with daturic acid of Meyer and Beer and the synthetic margaric acid of Krafft.

Lewkowitsch (20), therefore, considers the existence of daturic acid as proven.

Since then Dieterle in 1926 obtained from *Datura alba* an acid which, after fractional crystallization and precipitation, melted at $55-56^{\circ}$ and which, in other respects corresponded with daturic acid (21). However, Heiduschka and Luft (22) claim that the solid acid, from *Oenothera biennis*, which resembled the so-called daturic acid, could be resolved into palmitic acid and an acid with a higher number of carbon atoms. More recently Dieterle and co-workers (23) in an attempt at the better characterization of daturic acid, obtained from ergot, have prepared not only the magnesium salt and the methyl and ethyl esters but also the hydroamic acid.

Such is the situation with reference to daturic acid. It is the more unsettled since Shriner, Fulton and Burks, Jr. (24) point out that the equimolecular mixture of palmitic and stearic acid may be mistaken for margaric acid and that mixed melting points are not conclusive evidence for identification.

MELTING POINT

The fatty acids are important chemical compounds and have been the subject of an almost endless number of investigations. It has been customary to determine the melting point for their characterization. So many melting points have been reported in the literature in many cases that the value of the property is greatly lessened. Because of the variation in melting points the writer has prepared curves of the melting points of fatty acids and their methyl esters.

The melting points of the fatty acids having an even number of carbon atoms (Curve I) are somewhat higher than those with an odd number (Curve II). The data, in the case of the methyl esters, are not as complete as those of the acids except in the lower esters. The melting points of the esters of acids having an even number of carbon atoms (Curve III) are also higher than those with an odd number (Curve IV). In both cases when the curves are plotted side by side they are nearly parallel, approaching or crossing at about thirty carbon atoms.

The melting point of daturic acid is generally reported as 59.9° , varying, however, from 54° to 60° . This point does not fall on the curve. According to the curve this melting point should be about 61° . The melting points of palmitic and stearic acids reported in the literature vary somewhat and several writers

report a melting point below the curve, but several also report a melting point which falls on the curve, namely, 64° and 71° , respectively

The melting point of the methyl ester of daturic acid is reported as 29° to 30° . This point is slightly above the curve and probably should be nearer 28° unless that portion of the curve is plotted too low, due to lack of sufficient data. The melting point of the methyl ester of palmitic acid is reported as from 27° to 30° by several observers. The curve passes between these two points. The methyl ester of stearic acid is reported as from 38° to 40° . The curve also passes between these two points. Probably these melting points of the esters of palmitic and stearic acid reported are very nearly correct while that of daturic acid methyl ester is somewhat high. Round numbers have been used for the melting points of substances in this discussion for the purpose of illustrating the values of the curves.

EXPERIMENTAL

Ground seeds of *Datura Stramonium* purchased from S. B. Penick and Company were exhausted with 95 per cent alcohol. The alcohol was recovered by distilling under reduced pressure. The extracted material was shaken out with petroleum ether which was recovered leaving the fatty oil.

The oil was then saponified using a 10 per cent excess of KOH in 70 per cent alcohol. The alcohol having been recovered the non saponifiable material was removed by means of ether. The non saponifiable portion was studied by Givold (25) who reported that it contained sitosterol.

The liquid fatty acids were separated from the solid fatty acids by means of the Lead Salt Ether method (26). In this manner 1483 Gm. of solid fatty acids were obtained from 6550 Gm. of oil extracted from 35.4 Kg. of *Stramonium* seeds representing 22.6 per cent of the oil used or 4.2 per cent of the seeds used.

Negative results were obtained in attempts to separate the solid fatty acids by fractional crystallization from alcohol, fractional precipitation of the magnesium salts and vacuum distillation of the methyl esters.

CONCLUSIONS

The methods of separation referred to above are the ones formerly used and the negative results obtained point to the need of application of the studies in the identification of synthetic fatty acids by means of other derivatives such as were used by Reid (27) and his co-workers, Whitby (28) and others. The work of Francis, Piper and Malkin (29) in which they give the results of X-ray examinations of various fatty acids, synthetic and natural, could also be used with interest in the study of daturic acid, the identity of which is not yet firmly established in the minds of all investigators.

The writer wishes to express his appreciation to Professor Edward Kremers for his guidance in this work.

STUDIES ON BARBITURATES XI FURTHER CONTRIBUTIONS TO METHODS OF BARBITAL RESEARCH *

BY CHARLES R LINEGAR, JAMES M DILLE AND THEODORE KOPPANYI ¹

In a previous publication (1), we discussed different methods of extraction of barbiturates from urine, blood and tissues and also colorimetric methods for the estimation of barbiturates. From time to time we have received requests from other laboratories relative to certain difficulties encountered during the process of extraction of barbiturates, and although little difficulty is usually encountered in using the methods described in previous publications it was deemed advisable to improve this part of the procedure. This paper embodies the results of investigations devoted to the problem of the extraction of barbiturates.

URINE

Methods of Clarification—Chloroform extracts of pathological and even normal urine specimens are sometimes highly colored with urochrome and other pigments ². These materials may interfere with the colorimetric readings as described in the quantitative procedure of Koppanyi, *et al* (1). Ordinarily, if it is not necessary

* Scientific Section, A Ph A, Portland meeting, 1935

¹ From the Department of Pharmacology and Materia Medica, Georgetown University, School of Medicine, Washington, D C

² The interfering colored residues found in the evaporated chloroform extract need not represent urinary pigment, but may be due to some colored impurities present in the chloroform. In order to prevent this the chloroform used for extraction should be checked for such impurities by evaporating 100 to 200 cc to dryness. If these impurities are present the chloroform can be purified by distillation.

to concentrate the chloroform extract, colorimetric determinations may be carried out without removal of the pigments. However, in certain urines so much pigment is extracted that it is impossible to carry out colorimetric readings either directly or after concentration. Also, when the barbital content of the urine is very low and it is necessary to evaporate the extract to dryness, the amount of pigment which is taken up with the small amount of chloroform to carry out the test may be enough to prevent a satisfactory estimation of barbital and its derivatives.

Various procedures have been tried for clarifying highly colored urines before extraction with chloroform. The first requirement of any one of these methods is that it must not change the actual concentration of barbiturates in the urine, i. e., precipitate, adsorb or destroy these compounds. Secondly, it must remove sufficient pigment so that the final color development is not obscured, and it should not yield end-products, such as acetic acid from lead acetate, which have a deterrent action on the subsequent color development.

Our methods of extraction of barbiturates from the urine described previously (1, 3) fulfil these requirements for ordinary purposes, and only highly concentrated urine samples show pigments with the alkaline copper sulphate precipitation method. We believe that the difficulties with this method arise largely from the fact that copper sulphate and sodium hydroxide are not used in sufficient amounts to produce a heavy precipitation of the mixture. The heavily precipitated urines yield little if any pigments. We have endeavored, however, to improve even upon this alkaline copper sulphate precipitation method and have experimented with a number of other methods in an attempt to more completely remove the pigments from the urine without destroying or removing the barbiturates.

In this investigation, sodium barbital was added to pathological, highly pigmented normal urine specimens, and urines which had been concentrated on a water-bath. These urines were cleared by one of the methods described below and aliquots of the filtrate extracted with ten volumes of chloroform, the chloroform extract filtered and evaporated to dryness. Control urines, i. e., urines not cleared or urines cleared by other methods, were similarly treated in each case and the amount of the urinary pigment remaining in the evaporating dish after the evaporation of chloroform noted and compared. This residue was then dissolved in small volume of chloroform and the amount of barbital extracted was determined by the colorimetric procedure. Thus every method was checked not only as to its ability to remove pigment but also as to its efficiency in preserving the original barbital content of the urine.

The following new methods were used to clear the urine for the determination of barbiturates.

A Sufficient amounts of *bichloride of mercury* are added to urines until heavy white precipitation occurs. The precipitate is filtered off and an aliquot of the filtrate extracted with chloroform. Although considerable pigment was removed by this method, it did not prove to be practical because large amounts of barbital were precipitated and probably destroyed by this method.

B Enough *zinc sulphate* and *sodium hydroxide* is added to urines to produce heavy precipitation of zinc hydroxide. Although this method did not affect the barbital content of the urine, it was found to be rather ineffective in removing pigments.

C Two grams of *sodium molybdate* are added to every 25 cc of urine and sufficient *strong sulphuric acid* (20 to 30 per cent) to produce a heavy green precipitate. The precipitate is filtered off and the filtrate extracted, as usual, with chloroform. This method did not destroy the barbitol added to the urine, and was found to be effective in removing pigments from certain concentrated urine specimens. However, it was inferior to the method finally chosen and described below.

D Five cc of a 10 per cent *copper sulphate* solution are added to 25 cc of urine which is then made alkaline with 10 cc of a 10 per cent *sodium tungstate* solution. After mixing thoroughly, the mixture is filtered and 5 cc of 5 per cent *sulphuric acid* solution is added to 30 cc of the filtrate. This is mixed, allowed to stand for about twenty minutes and again filtered. Twenty-five (25) cc of this filtrate, which is equivalent to 13.39 cc of the original urine, is extracted with chloroform. More pigment will be removed by this method if the amounts of reagents used for the 25 cc of urine are doubled. This latter procedure has the disadvantage, however, of requiring a much longer time for filtration.

This method was compared with the original alkaline copper sulphate precipitation method and was found to be its equal in lightly colored urines. However, in highly colored urine specimens this method removed more pigment than any other method. No barbitol was removed during this procedure.

Extraction of Diethyl Barbituric Acid from Alkaline Urine—In a previous publication, we stressed the fact that urines or the cleared filtrates must be acidulated before extraction. This was a necessary precaution because the alkaline salts of barbituric acids are insoluble in chloroform. However, we observed repeatedly that alkaline urines not acidulated before extraction showed the presence of barbituric acids in the chloroform extracts. This led us to suspect that some of the excreted barbiturates are present as acids even in alkaline urines. A typical experiment demonstrating the above fact is described below.

Dog Female, 11.4 Kg, given by femoral vein, 1650 mg per Kg of sodium barbitol in divided doses with picrotoxin. Died 1 hour and 25 minutes after the last injection.

The urine excreted during this period was secured by catheterization of the bladder and its p_H was found to be 7.5 by indicators.

Ten cc of the urine was extracted directly without acidulation with ten volumes of chloroform. The colorimetric determination showed that the extract contained 0.4 mg of barbitol per cc.

Another 10 cc of the same urine was acidulated with dilute sulphuric acid and extracted with ten volumes of chloroform. The colorimetric test showed in this case the presence of 0.6 mg of barbitol per cc of the extract.

We endeavored to duplicate these results by adding various amounts of sodium barbitol (an alkaline salt) to portions of alkaline rabbit and human urines which had a p_H of 8.0 as determined by the use of indicators. Ten-cc portions of each concentration were extracted directly, without acidulation with 100 cc of chloroform and this chloroform was then tested for barbitol. The results of one of these experiments on rabbit urine are summarized in Table I.

It can be seen that the amount of barbitol recovered is inversely proportional to the amount of sodium barbitol added to the urine. Sodium barbitol added to

distilled water which was adjusted to p_H 8.0 was not changed into barbital and the chloroform used to extract this solution gave negative tests for barbiturates throughout the experiment

BLOOD

The modified Folin-Wu method for blood precipitation gives such uniform results and clear extracts that no further improvements are deemed necessary. However, we have never extracted volumes of blood larger than 20 to 30 cc and thus have not tested the pigment removing capacity of the Folin-Wu method for large amounts of blood. Two hundred cc of freshly drawn oxalated dog blood were precipitated by adding 200 cc of 10 per cent sodium tungstate and 400 cc of $\frac{2}{3}$ normal sulphuric acid solutions. The filtrate (485 cc) was evaporated on a water-bath until it reached a volume of 75 cc and was then extracted with ten volumes of chloroform. This chloroform extract evaporated to dryness showed no pigments.

Incidentally we endeavored to check the specificity of our barium hydroxide and lithium hydroxide tests on this evaporated extract¹. The evaporated residue of the total blood extract was taken up in 10 cc of chloroform and tested colorimetrically. Negative results in all three ranges of the micro (lithium hydroxide) and in the first range of the macro (barium hydroxide) tests were noted.

TISSUES

The alkaline copper sulphate precipitation method and the liquid air method described previously (1) suffice for the study of the barbital concentration of organs. We want to emphasize again, however, that with the alkaline copper sulphate precipitation method the best results are obtained if the proportions of copper sulphate and sodium hydroxide solutions are such as to change the liquefied tissues to a heavy, massive, semi-solid mixture.

The liquid air method, as emphasized elsewhere (1), gives the best yield of barbiturates. However, this method cannot be applied to the extraction of barbiturates from the central nervous system, because as already observed (2) the

¹ The colorimetric test for barbiturates cannot be carried out in ether. The addition of the reagents to an ether extract produces dirty precipitates of miscellaneous hues but no clear cut blue colors. Therefore if ether is used as the extractive medium, it must be evaporated off and the residue taken up in chloroform for testing.

lecithins and cephalins of the central nervous system are easily soluble in chloroform and interfere with the development of color in the test for barbiturates

Recently, we found a simple method which allowed us to estimate the barbiturate content of the brain by using the liquid air method. Brain tissue is frozen in liquid air and pulverized. This powdered brain tissue is shaken with chloroform, the chloroform extract is filtered and evaporated to dryness on a water-bath, and the residue taken up again in a small volume of chloroform to which acetone is added drop by drop. A heavy precipitation of phospholipids occurs in the solution. The precipitate is filtered off and acetone is added again to the filtrate to ascertain whether the phospholipids have been completely removed. The solution in which no more precipitation occurs with acetone is again evaporated to dryness, and the residue taken up with chloroform and tested. In properly treated extracts, the test can be carried out without interference.

DISCUSSION

The additional methods described for the clarification of urine will probably be useful to those who are working with pathological or highly concentrated urines. It is recommended that before discarding a urine sample as unsuitable for colorimetric estimation of barbiturates all three methods for clarification, namely, the copper sulphate, the sodium molybdate, and the copper sulphate-sodium tungstate methods, should be tried. There will be very few urines, indeed, which when appropriately cleared could not be used for the quantitative estimation of barbiturates.

We have shown that the urine has the capacity even at a relatively high pH of converting sodium barbital into the acid form. The amount of sodium barbital added to alkaline urines and recovered as diethyl barbituric acid is inversely proportional to the amount originally added. It is evident that there is a buffering action of the urine which changes a portion of sodium barbital to barbital, thus making it available for extraction with chloroform. This buffering power of the urine is almost constant since the percentage of barbital formed from the alkaline salt decreases as the amount of added sodium barbital increases. This characteristic of the urine has not been previously observed as far as barbiturates are concerned, but we have described the same phenomenon concerning the blood (3). We conclude, therefore that both blood and urine have the capacity to convert sodium barbital into barbital.

We have shown that even large amounts of blood can be extracted with chloroform without the slightest trace of pigments in the extract. We have also shown that even such large volumes of blood, if the extract is evaporated to dryness and then taken up in a very small volume of chloroform, contain no substance which reacts in our macro or micro tests to give a blue color. These tests, therefore, can be safely used in the diagnosis of barbiturate poisonings.

The liquid air extraction method for other tissues is now extended to the brain, if the phospholipids are removed with acetone. This not only provides a very convenient and rapid method for the extraction of barbiturates from the central nervous system, but also shows that our assumption expressed in the previous communication (2) that lecithins interfere with the colorimetric estimation of barbital, was correct.

This not only provides a very convenient and rapid method for the extraction of barbiturates from the central nervous system, but also shows that our assumption expressed in the previous communication (2) that lecithins interfere with the colorimetric estimation of barbital, was correct.

SUMMARY

1 Two practical methods of clearing highly colored urines for the purpose of quantitative estimations of barbiturates are described

2 The urine has a limited buffering capacity manifested in the conversion of sodium barbital into the acid form even in alkaline urines. The amount of barbital so converted is inversely proportional to the amount of sodium barbital originally added to the urine

3 Large volumes of blood (after Folin-Wu precipitation) may be extracted with chloroform without obtaining interfering materials in the chloroform extract even after concentration

4 The liquid air method of direct extraction of barbiturates can now be applied to the central nervous system after removing the phospholipids from the chloroform extract with acetone

A PLAN FOR PHARMACY INTERNSHIPS AT THE UNIVERSITY OF MICHIGAN HOSPITALS *

BY HARVEY A K WHITNEY¹ AND E C WATTS²

Pharmacy as a profession is unquestionably suffering influences that are tending toward pronounced changes. It will not be argued here that pharmacy is or is not wholly conscious of the drift. Certain it is, however, that the authors feel their incapability of intelligent argument or prediction.

Since words have been spoken and written it has been charged that many things are wrong with pharmacy. It has been said that the profession requires fewer and better pharmacists, fewer and better pharmacies and fewer and better schools of instruction. Professional mediocrity does exist within the rank and file of pharmacists and likewise professional morals and business standards are frequently unobserved. This condition reflects to the disadvantage of the public and the physician. Others have claimed that colleges of pharmacy should not and cannot be required to turn out a finished professional and business product. This reflects to the disadvantage of the pharmacist. For comparison it is argued that medical men do not expect such finished products to be graduated from medical schools. However, there are those in the medical profession who recognize this deficiency and consequently make some provision toward a remedy. One needs only mention the general requirement of service as intern before the graduate physician is licensed to practice medicine. It is because the authors sense the same deficiency in pharmacy that the outline of service that follows is proposed for our hospital group.

* Section on Practical Pharmacy and Dispensing A Ph A Portland meeting 1935

¹ Chief Pharmacist

² Assistant Chief Pharmacist

A competent and well-organized pharmacy is an essential part of every large modern hospital. In operation it becomes necessary that the hospital pharmacy properly appreciate its duties and privileges in the matter of pharmaceutical and medical education. Medical education, yes, for pharmacy still remains a branch of the practice of medicine. Moreover, and especially if a unit of an important teaching institution, the rôle of the hospital pharmacy attains a superior position in such endeavors. It is therefore the further purpose of this plan to provide at once for the hospital pharmacy as an efficiently functioning service unit and an educational unit for training such graduates in pharmacy as may be interested in postgraduate practical and professional services. Some experience with this proposed plan has been had in the past through the unannounced policy of engaging for duty only recent graduates of the University College of Pharmacy. These individuals have been appointed after being encouraged to believe it would be possible to gain considerable valuable experience. Generally successful efforts have resulted from the subsequent attempts to find permanent places for such experienced "interns."

It is therefore proposed that the personnel of the Hospital Pharmacy be constituted and appointed in accordance with the following scheme

A Permanent (Staff) Employees		No	B Temporary (Term) Employees		No
1	Chief Pharmacist	1	1	Pharmacist, Master Grade	2
2	Assistant Chief Pharmacist	1	2	Pharmacist, Senior Grade	2
3	Pharmacist-Secretary	1	3	Pharmacist, Junior Grade	2
			4	Pharmacy Assistants, nonregistered	0

It may be taken for granted that the functions and duties of the permanent employees will be well understood. It is anticipated the term employees will be selected from a list of approved applicants. An approved applicant is defined as a recent graduate of one of the member schools of the American Association of Colleges of Pharmacy. It may be further understood that applicants from the University of Michigan will be shown first favor. Such an applicant when accepted will receive an appointment as Junior Grade Pharmacist, enduring for one year. If this probationary period is successfully passed the candidate will be re-appointed for a second year as Senior Grade Pharmacist. At the completion of the internship, he may, if he so desires, apply for the third year of postgraduate instruction leading to the award of Master Hospital Pharmacist. It is anticipated further that candidates receiving the certificate of Master Hospital Pharmacist will merit the respect of the entire staff of the University Hospital and that this institution will offer all possible help, that he may put to practical use the information and experience acquired during his residence.

The experiences and services offered to the pharmacy intern will be of that order peculiar to the hospital pharmacy and representative of the highest order of professional practices. Since the hospital pharmacy in fact and influence reaches into practically every department of the hospital it is a matter of considerable concern that this department's operative skill and "end-products" be flawless and faultless. In many instances the responsibility centered in the chief pharmacist will of necessity be divided to some degree among the junior staff members, generally in extent compatible with their grade. The major departmental work

is divisible by the number of grades in the term group and is separable into particular endeavors for rotating service. Such segregations may include, for example, magistral pharmacy, galenical and official preparations, colloidal, isotonic and parenteral solutions, and analytical and control work. Particular attention is also given to bacteriological procedures, sterilizing processes, hydrogen-ion concentration, laboratory reagents and solutions, surgical dressings and preparations and the modern materia medica (including clinical evaluations of experimental material).

Further, since it is the prescription that unites the pharmacist and the physician in the medical arts, particular stress is laid upon the interpretation of such orders. Prescriptions may be properly interpreted upon the basis of intent, bringing into consideration all known facts pertinent or relating to the drug and the patient. It is further contemplated that service will include a directed program of extramural work. Such efforts, essays, reports and reviews will be regularly presented to all members of the staff in regular meetings. Material regarded, by the staff, as of importance to the other departments of the hospital will be submitted thereto for disposition.

It necessarily follows that the adoption of such a plan should also include a definite schedule of remuneration for the individual. It is obvious, despite the attractiveness of the type of work, the graduate student will regard such employment as competitive, and to meet the competitive phase and to maintain the attractiveness of the offer provides no small problem. It is quite generally agreed, to attract graduates of a higher order, that current professional wage scales will have to be paid. In this respect comparisons with medical internships offer a severe change.

A CHEMICAL STUDY OF SULPHUR OINTMENT

BY LEWIS C. BRITT *

The industrial, biological and medicinal importance of sulphur have made its quantitative determination a common laboratory procedure. Sulphur has been used as a remedial agent since antiquity and still enjoys popular recognition. Notwithstanding the medicinal importance, little attention seems to have been given to the quantitative determination of sulphur when combined with a fatty base.

Among samples submitted for analysis at the Oregon Board of Pharmacy Drug Laboratory were several of sulphur ointment. These samples were obtained through counter purchases (not prescriptions) made by inspectors in drug stores, which were variously located in the state. A survey of the literature revealed no satisfactory method for a gravimetric determination of sulphur in this preparation. Elsdon (1) has recommended the oxidation of the sulphur to sulphur trioxide by a mixture of bromine and nitric acid, removal of the fat from the resulting mixture by ether extraction, and a gravimetric determination of the sulphur trioxide in the aqueous solution by barium chloride precipitation. The details for conducting the method and data for known samples were not given. The

* Assistant Professor of Pharmaceutical Analysis, Oregon State Agriculture College, School of Pharmacy, Corvallis, Ore

method was said to give satisfactory results but the reader is not informed as to the significance of this statement. An attempt to determine the accuracy of the method was abandoned due to inability to control the offensive and dangerous bromine vapors.

Volumetric methods for the determination of sulphur in organic combination and mixtures are more numerous. Upton (2), Castiglioni (3) and Allport (4) have suggested volumetric methods and since the completion of this study Fleck and Ward (5) have suggested yet another.

The following method has been found to give dependable results for the determination of sulphur in sulphur ointment.

Treat about one Gm. of the well-mixed and accurately weighed ointment with 50 cc. of 10 per cent potassium hydroxide solution, boil gently until the lard is saponified and the sulphur converted to soluble sulphides (usually about one half hour). Add 50 cc. of solution of hydrogen peroxide and digest slightly below the boiling point for thirty minutes. Make slightly acid with hydrochloric acid free of sulphur trioxide, heat to boiling, cool, filter and wash the vessel used in the saponification and the filter paper with distilled water. Determine the sulphur trioxide in the filtrate by barium chloride precipitation in the usual way. Correct the resulting weight of barium sulphate by a blank run on the solutions of hydrogen peroxide and potassium hydroxide and multiply the final weight of barium sulphate by 0.1373 to obtain the equivalent weight of sulphur.

After the oxidized solution has been made acid it must be heated to boiling to drive the fatty acids to the surface of the liquid and then thoroughly cooled to allow them to solidify, so they may be removed by filtration. If the fatty acids are allowed to enter the filtrate they will form insoluble barium salts which will cause the result of the analysis to run high.

A blank must be conducted to determine the sulphur trioxide in the alkali and peroxide solutions. If the method is run frequently, considerable time may be saved by standardizing the reagents in quantity and omitting the blank with each sample. The possibility that lard should be included in the blank was suggested and tests were run to ascertain the possibility of error from this source. The samples of benzoinated lard (U. S. P.) examined were found to average 0.0002 Gm. of barium sulphate per Gm. of lard, equivalent to 0.0000275 Gm. of sulphur. This amount is considered negligible and it is not thought to be necessary to include lard in the blank.

The accuracy of the method was determined from analyses conducted on sulphur ointments of known strength. The sulphur used in these preparations assayed 99.576 per cent pure by the U. S. P. X method. The efficiency of the method may be judged by the results in Table I.

Satisfactory results were also obtained with the method by students who ran an analysis of sulphur ointment as a laboratory experiment in courses in drug analysis.

EXAMINATION OF COMMERCIAL OINTMENTS

A total of thirteen samples of sulphur ointment, collected by drug inspectors from various stores in Oregon, have been examined. With the exception of two, all samples were prepared extemporaneously in the stores. Only three of the samples were found to contain from 14.5 to 15.5 per cent sulphur by weight in benzoinated lard, which were considered to be U. S. P. requirements. In the remaining samples

the amount of sulphur was found to vary from 13.0 to 22.467 per cent by weight and six of these were made with petrolatum base

TABLE I

Sample No	Wt of Sample	Per Cent Sulphur Added	Per Cent Sulphur Found	Difference
1	1.6076	7.673	7.666	0.007
1	1.8044	7.673	7.763	0.090
2	1.6741	8.916	8.921	0.005
2	1.7561	8.916	9.029	0.113
2	0.8499	8.916	8.918	0.002
3	0.7670	14.489	14.491	0.002
3	1.1902	14.489	15.505	0.016
3	0.7748	14.489	14.628	0.139
4	1.0785	16.348	16.446	0.098
4	1.0511	16.348	16.350	0.002
4	0.9964	16.348	16.366	0.018

CONCLUSIONS

1 A workable method, suitable for the gravimetric determination of sulphur ointment, has been devised

2 The number of samples of sulphur ointment examined indicates a tendency on the part of retail pharmacists to substitute petrolatum for benzoated lard, as 46 per cent of those examined were made with petrolatum base

3 If the ointment requires petrolatum or wax to render it stable, their effect on the therapeutic value of the preparation should be determined, to allow for their addition if possible

4 A study of the stability of the official ointment and ointments prepared with varying amounts of petrolatum and wax would be of interest

MEDICINE DROPPER TO DELIVER ONE MINIM (APOTHECARY'S MEASURE) PER DROP *

BY R A KONNERTH, R E SCHOETZOW AND F W NITARDY ¹

In prescribing potent galenicals such as Tincture of Digitalis, the physician frequently refers to drops when directing dosage. This practice subjects the dose actually administered to wide variations which depend upon the size and shape of countless varieties of droppers on the market

* Section on Practical Pharmacy and Dispensing, A. Ph. A. Portland meeting 1935

¹ Chemical and Pharmaceutical Laboratories E. R. Squibb & Sons Brooklyn New York

In designing a dropper which will deliver one minim per drop as nearly as possible, the factors which govern the formation and size of drops must be considered

The maximum volume of a drop of a given liquid which can form is dependent upon the surface tension of the liquid and its specific gravity. Such a maximum drop can form only when a flat surface of sufficient area is available.

The surface tension of hydro-alcoholic mixtures (as used in the preparation of Tincture of Digitalis) is such that at room temperature (25° C) the maximum drop is just less than one minim. A dropper, which will yield this maximum drop of such a hydro alcoholic solution, has been designed. It consists of a straight glass tube 8 cm. in length and having an internal diameter of 3.8 mm. One end is attached to a rubber bulb, while the other end is formed into a flange as shown in Fig. 1.

Slight modification in the dimensions of the dropping flange will furnish a dropper suitable for minim per drop delivery of other liquids.

For Tincture of Digitalis the diameter of the dropping surface is 10.7 mm and the delivery end of the tube is constricted leaving an orifice of 3.8 mm to prevent leakage and increase accuracy. In order to obtain the maximum drop this dropper must be held in a vertical position and the drops expelled slowly from the full tube.

The accuracy of this dropper is shown by the following results obtained using Tincture of Digitalis at 25° C in thirty-five samples of the droppers selected at random from stock.

Fig. 1

Minims per Drop	Number of Droppers Delivering This Amount
0.990-0.995	5
0.970-0.989	3
0.950-0.969	12
0.930-0.949	10
0.910-0.929	3
Less than 0.910	2

The largest volume delivered was 0.995 minims per drop, while the least was 0.901 minims per drop.

Prof. Harold Urey, discoverer of heavy water and Nobel Prize winner, has been awarded the Ernest Kempton Adams Research Fellowship in chemistry for 1935-1936. Columbia University announced October 10th. The announcement said Prof. Urey would be enabled to enter a new field of research.

A portrait of the late Prof. Charles F. Chandler—one of the founders of the American Chemical Society and member of the American Pharmaceutical Association from 1867 until his demise in 1925—was presented to Columbia University.

DAVID HENSHAW—FROM "DRUGGIST" TO SECRETARY OF THE NAVY *¹

BY GEORGE E. ÉWE

A record of the life activities of a man who started out as a "druggist" and later rose to the highest political office ever attained by an erstwhile member of the drug business, as far as known, should prove of interest to pharmacists in general and be worthy of retention in the archives of the profession

While David Henshaw is most generally put down as politician, promoter and author, his five years of apprenticeship followed by about thirteen years of joint proprietorship in the drug business, with which he started his business life, places him definitely as one of the drug calling

David Henshaw was a descendant of Joshua Henshaw of Lancashire, England, who settled in Dorehester, Mass., in about 1653. Henshaw's ancestors later moved

to Leicester, Mass., and were among the original proprietors of the town. His father was a patriot of the Revolution and a highly respected magistrate.

David Henshaw was born on April 2, 1795, in Leicester, Mass., the fifth son of David and Mary (Sargent) Henshaw. He was related to Artemus Ward, Commander-in-Chief of the Massachusetts forces during the Revolutionary War, who was in nominal command at the battle of Bunker Hill. Henshaw spent his boyhood days on his father's farm attending, during this time, the free schools and academy of his native town.

At sixteen years of age he became druggist's apprentice with the firm of Dix and Brinley who carried on a "drug, paint and dye-stuffs" business

DAVID HENSHAW

located in the old Faneuil Hall Building in Boston, Mass.

"On coming of age, although his employers were desirous of still retaining his services, yet they were unwilling to offer him more than $\frac{1}{8}$ of the business profits. They, as many Boston firms both before and since, made a mistake. The smart, enterprising and self-reliant young man thought he could do better, and he did. He determined to be his own master and without a dollar of capital set up for himself. Hiring, at a cheap rent, the store opposite the old State House in State Street (Boston), lately occupied as the office of the 'Boston Daily Advertiser,' he filled it up, but, with the exception of a barrel or two of ochre and possibly a few bottles, etc., he had no stock to put in. His old employer Mr. Brinley, often called as he was passing to his own store under Faneuil Hall, ostensibly to see how 'David' as he always called him, got along. His invariable salutation was 'Well, David, how's business?' David could not, with truth say it

* Section on Historical Pharmacy, Portland meeting, 1935

¹ Research Laboratories, Tailby-Nason Company, Boston, Mass.

was good, as he had nothing to do business with, but the young man had not, in the meantime, been idle. He knew that most of their (his old firm's) goods came from the old house of David Taylor and Son, London. He had written them, stating all the circumstances of the case and at the same time enclosing a list of articles that he wanted, and promised, if they were sent to him, to remit the pay within a certain time. As there were no ocean steamers or telegraphic means of communication then, it took a long time for an answer, but it came at last in the shape of an ample stock for the long empty shelves. Old Mr. Brinley, during all this long time, had been constant in his calling on young David, possibly hoping that the valuable apprentice might be glad to go back to his old place again. But young David, though always honest, was sharp and far seeing—he had kept his business with Taylor and Sons to himself. Last of all he would have mentioned the matter to his old employer, who opened his eyes very wide with surprise one fine morning on beholding the almost magical change in David's amount and variety of stock."¹

Henshaw's business prospered mightily under his vigorous policies and seriously cut into the business of his former employers. In 1814, he allied himself with one David Rice, an expert paint man and glazier, as "Rice and Henshaw" and located in new quarters at 33 India Street (Boston). The business proved very successful and was further expanded. John Henshaw, a younger brother of David Henshaw, was admitted and the name of the firm was changed to "Rice, Henshaw and Co." Upon the retirement of Mr. Rice in 1825, Chas. Henshaw, an older brother, was admitted as partner and the firm's name was again changed—this time to "David and John Henshaw and Co."

Henshaw's firm also had a chemical works at South Boston and the following incident in connection with these works, taken from the aforesaid newspaper clipping seems worthy of recounting:

"The Messrs. Perkins receiving a large quantity of crude camphor which came on the deck of one of their ships from the East Indies, wanted Mr. Henshaw to buy it at 37¢ per lb. It came to \$45,000.00 quite a large amount of money for those days of comparatively small transactions. 'Mr. Perkins,' said Mr. Henshaw, 'we will take the camphor, if you can see your way clear to accept the note of our firm—we can give you nothing else.' Perfectly satisfactory," replied Mr. Perkins. This camphor was probably a safe purchase in any event, but it proved to be a very profitable investment. It was taken to their chemical works at South Boston, which, as they were largely engaged in the manufacture of spirits of turpentine, were, a part of them, burnt up on an average once a year and refined. Soon after the cholera first made its appearance in this country and the people having got it in their heads that camphor was a good thing to ward off its attack, their great stock of it was soon all gone at \$2.50 per pound."

But while the drug business was very profitable and successful it did not claim all of Henshaw's time and energies and he was interested in other ventures. He gave up the drug business in 1829 after about thirteen years of operation, presumably because of the pressure of his other activities.

Before he was 23 he had become a banker and had established an insurance company. By 1828 he had actively furthered a project for a railroad through the Berkshires to Albany, New York. Later, he became an incorporator of the "Western Railroad," which, with the "Boston and Worcester" of which he was also a director, completed the interstate line to Albany.

Henshaw possessed a keen knowledge of men and affairs, read much and was a vigorous author. He made frequent contributions to the *Boston Post* and other

¹ From a newspaper clipping of unknown date or origin kindly furnished by Miss Mahel W. Henshaw, Cambridge, Mass. Incidentally, this clipping affords many other anecdotes illustrating the humanness, liberality and sagacity of David Henshaw.

periodicals and wrote the important "Letters on the Internal Improvement and Commerce of the West "

In 1821, he and his associates established the *Boston Statesman* which opposed John Quincy Adams for president, but Henshaw later made terms with President Adams and gained election from Suffolk County to the Massachusetts State Senate in 1826 on President Adams' party ticket. Henshaw waged an active political life covering local, state and national affairs and became in turn Collector of the Port of Boston, Democratic "boss" of Massachusetts, State Legislator and Secretary of the Navy under President Tyler.

He was appointed Collector of the Port of Boston in 1829 by President Jackson and held this office for nine years to the acceptance of all who had occasion to do business with that department. He had great practical experience with high executive ability and brought these successfully to bear upon the orderly and systematic management of the affairs of this office.

His Navy Secretaryship dated from July 23, 1843 to Feb 19, 1844, when the Senate rejected his appointment in deference to Webster and other Whigs. But he had charge of it long enough to convince eminent talents and qualifications for the place. While Secretary he introduced a system of strict accountability for funds and materials of the department far beyond previous custom and also advocated the annexation of Texas as preliminary to the acquisition of California.

Henshaw's democracy was conservative. He was a capitalist, a Mason, an opponent of prohibition, a friend of slaveholders. A political rival characterized him as "a shrewd, selfish, strong-minded (but I believe corrupt-hearted) man" who directed his party "with a rod of iron" and would "see it damned ere others should."

Henshaw's will to rule was unmistakable, but there is little reason for questioning the sincerity of his convictions. "An ardent politician of the Jeffersonian school and true to its principles as the needle to the pole" (from inscription on Henshaw's tombstone). Incidentally, an inspection of this tombstone disclosed that it is inscribed with an extensive account of Henshaw's activities embracing a total of 232 words. He was a self-made man who achieved for himself wealth, political influence and power and an unquestioned reputation for mental vigor and energy of purpose, of no ordinary character. While the innate qualities of David Henshaw presaged success in the enterprises in which he engaged, one is disposed to feel that the studiousness, diplomacy, knowledge of people and organizing ability inculcated by his fairly extensive experience in the "drug" business materially aided in the attainment of this success.

Although he never married he dispensed a generous hospitality at his country home in Leicester, Mass. Henshaw died on Nov 11, 1852. Mr D H McKenna, Town Clerk of Leicester, Mass, states in a personal communication

"I am told his (Henshaw's) body is interred in 'Pine Grove Cemetery,' Pine Street, Leicester, in, presumably, the first cast iron casket in New England. About 1912 the old homestead (Henshaw's) was connected with our public water supply. In course of the work excavating for that purpose, several old cannon balls were unearthed. These relics are now in possession of William Montgomery who occupies the house at the present time."

In explanation of the finding of these cannon balls it may be of interest to note that in Henshaw's childhood a fort was situated directly opposite the Henshaw homestead and Henshaw, as a boy, was often lodged in the fort over night for pro

tection from marauding Indians. However, a pilgrimage to the Henshaw homestead disclosed that no relics of Henshaw are on deposit there, apparently the only relics extant being an oil painting and a tinted tintype of Henshaw in the possession of Miss Mabel W. Henshaw, Cambridge, Mass. Incidentally, these are the only likenesses of David Henshaw encountered in this study.

Henshaw's homestead, now much reduced in spaciousness, by demolition of various sections, to suit the needs of the present day, is located in Henshaw Park, Leicester, Mass., and is the oldest house in the town.

Acknowledgment is due Miss Mary D. Thurston, of Leicester, Mass., whose line of forebears was the same as that of David Henshaw, for contributions to the data embodied in this account.

The references listed herewith afford voluminous data which will be appreciated by the especially interested. Many anecdotes suitable for pharmaceutical eyes are also to be found among these references. But space-saving dictates the omission of these anecdotes, which are of the type utilized above in this account to illustrate the remarkable abilities and character of David Henshaw who made the "drug" business one of the stepping-stones to the high office of Secretary of the Navy.

HOW TO HELP THE PHARMACIST COMMERCIALLY *

BY E. C. BROKMEYER

It is so self-evident that the pharmacist must be qualified professionally to succeed that further comment as to this is unnecessary.

If the American people appreciated and supported professional pharmacy to the same extent that the English people do, there would be no place on the program of this convention for the presentation of a paper on the subject of "How to Help the Pharmacist Commercially." Whether wisely or not, the American people have seen fit to develop the American drug store along commercial rather than professional lines. It is true that here and there pharmacists have scored distinct successes in the conduct of strictly professional or ethical pharmacies, but unfortunately they are the exceptions rather than the rule.

When the writer of this paper discusses "How to Help the Pharmacist Commercially" it must not be understood that he in the least fails to appraise professional pharmacy at its true and proper value—the highest. The profession of pharmacy

* Section on Education and Legislation, A. P. H. A., Portland meeting, 1935

is and must continue to be equal in importance with all other professions, including medicine and law. Its relationship and responsibility to the public are equally important and serious. The only justification for a paper on "How to Help the Pharmacist Commercially" is the fact that as conditions confront the American druggist to day his problem is to become solvent in thousands of cases and to remain so. This is no less a serious problem for the American people, but unfortunately they either do not know it or, if they do, they are in the main indifferent.

The pharmacist may be helped commercially in a number of ways. Under the National Industrial Recovery Act, NRA encouraged the adoption of scientific cost accounting methods where not used and where impossible. Unfortunately the average pharmacist does not have the necessary capital to enjoy the benefit of such methods by engaging qualified accountants, but nevertheless he may call in a qualified accountant and have him place his books and accounts and system of conducting his business in proper order and from time to time check up his store. A pharmacist at all times should know accurately his cost of doing business, including every factor that enters into its determination, in order to ascertain the price at which he must sell his merchandise and his service so as to net him a reasonable profit on his investment, including his professional training.

A pharmacist may be helped commercially by emulating as far as possible the example of the modern enterprising and progressive chain and department stores. Although the limited capital of the average pharmacist is a serious handicap, the fact remains that he can improve the appearance of his store and his display windows and make more of an appeal to the public. He will lose nothing by going out of his way to be accommodating and see that his clerks are. He must inspire confidence in his patrons. He must note fast- and slow-moving merchandise and govern himself accordingly in handling it. He should cultivate his patrons as much as possible, both in person and occasionally by mail, if not by local advertising, including the radio. The pharmacist should above all things exercise extraordinary care in compounding physicians' prescriptions and take pains to see that his registered clerk does. There should be no shortage or excess in the quantities of the ingredients prescribed. A preparation compounded upon a physician's prescription should be neither adulterated nor misbranded under the law. The pharmacist will help himself commercially by exercising extraordinary care in compounding prescriptions and getting the benefit of a reputation for doing this.

A pharmacist can help himself commercially and his fellow pharmacists by resorting to fair trade practices at all times and under all conditions, however trying. The National Industrial Recovery Act failed of successful administration because of the lack of full and proper cooperation on the part of many units in the industries and professions in observing the rules adopted by them and approved by NRA.

Finally, the pharmacist may be helped commercially by legislation and honest and efficient administration of the laws needed for his protection against unfair competition. To obtain these needed laws and proper enforcement pharmacists must be organized into forceful and intelligently directed city, state and national associations. This is not enough—pharmacists must sell their profession and their business to the public. Until they do they cannot reasonably expect the laws needed to protect them against unfair competition, which in most cases means destructive competition.

THE PHARMACIST STUDIES LAW *

BY CHARLES G. AJAX

As students, we learned that pharmacy is an ever-unfolding science, that we can conceive of no cessation in the study of the laws of nature. And that necessity captured our imagination. We looked forward to practicing our profession, at the same time, as initiates into the mysteries of nature, we understood that there could be no formula in a compromise with truth.

It soon became evident that in the economy of pharmacy other laws were involved which, in accordance with social phenomena, are likewise in a continuous state of evolution—a biological interpretation of law, as it were. These are trade regulations which, in accord with the common practice of the biological science, reach a balance or equilibrium at times in the whim of the consumer—and man is satisfied—for the time being. It is thus apparent that these laws are in constant flux. While the law of supply and demand remains unalterable, its varying manifestations bring new problems to us daily in the interest of *fair play*.

And now, if we are to keep up with the procession, another type of law must be studied. We must understand so-called Constitutional Law. The American system of law-making is a thing, fearfully and wonderfully built. From the village constable up to the nation's President, from Congress at Washington down to the Council of Podunk, each unit of legislative or judicial authority is hedged with perplexing limitations. Our government has been called a system of checks and balances. Our bewildered brains whisper, "Ah, yes, plenty of checks—a check on every forward-looking effort. But nothing is balanced."

When a mariner is adrift in a stormy night his fears are calmed by study of the charts, which his good judgment planned during fair weather. May I question if, in the darkness and stress of to-day, we have a compass and chart for guidance? Let us look at fundamental law and ascertain.

The most basic factor to comprehend is that the constitutionality of law is not a subject for exact laboratory technique. It has less exactness than our laboratory sciences, for it is purely a human means—so liable to fallibility since social values are personal. Were each of us in this room handed a specimen of an unknown substance to determine whether it was acid, alkali or neutral, an identical laboratory report would be obtained from all. Not so with jurisprudence, whether it be a law of Congress, or of city council. A body of attorneys, handed a new mandate for legal analysis, might submit multitudinous interpretations. But the large majority will respond in a manner well calculated to preserve dignity in the final verdict of the Supreme Court. Regardless of that decision, most of these will have been so ambiguously phrased that each may proudly announce, "I told you so!"

I have no quarrel with juridical science, since our very system of government makes this state of affairs inevitable. Nevertheless, when we pharmacists see lawyers and judges forever in disagreement, when we perceive respected experts on either side of every question, *failing to take cognizance of social justice*, may we not feel justified in analyzing for ourselves in the molding force of legal progress?

The question has more than academic interest. It is not my purpose to amuse you with aimless reflections on our system of law-making. There are certain defi-

prevents fire, pestilence, insurrection, the sale of impure foods and obscene literature, is the same power of the people which now undertakes to safeguard *the owner* of a twenty-million dollar trade-mark, as well as the little merchant who sells a tube of toothpaste so costly trade-marked

It cannot be over-emphasized that Fair Trade laws aim to serve the small shopkeeper with his small stock, just as much as they are intended to *protect owners* of million dollar trade-marks. And conversely, Fair Trade laws will protect the consumer, not merely indirectly by enabling the independent merchant to remain solvent and to maintain his position as a sustaining citizen, but by eliminating a multitude of fraudulent practices which follow "loss leader" advertising. These abuses are too well known among ourselves to require discussion, but the public's education on this subject has never received deserved attention.

Do you not get the right prospective?—A nation of almost 130,000,000 people, including a conservative estimate of 120,000,000 fair-minded citizens—Forget for the moment the 10,000,000, and bear in mind that there are 120,000,000 of us, *little folks*. We are The People. Aren't we, The People, entitled to determine under which laws we'll live? Now you and I have *the requisite power*. *Let's use it*. If we do not, I foresee cataclysmic upheavals because of our very stupidity.

When the glib salesman of an unfair manufacturer or a sleek competitor gabs about constitutional law and talks of Fair Trade laws as the bunk, don't discuss the matter. You need not get on the defensive. Simply state "I'm sorry, Mister, but I've studied law myself, and I'm too busy to argue with anyone who hasn't."

The Greeks had a word for it, and let me refresh your memory—no people better understood the value of local rule in relation to law, for which they had profound respect. Government was The People. In fact, Athens was termed a "City State." Can you not hear the echoes of the cheering audience as the Athenian in the play rebukes a stranger with these words:

"It is a city and *free*
The *whole folk* year by year, in parity of service
is *our King*"

DEVELOPMENT OF PHARMACY IN WEST CHINA

BY E. N. MEUSER *

"Four Thousand Years of Pharmacy" gives an exceedingly interesting account of the ancient history of Egyptian and Babylonian pharmacy. Comparatively little mention is made, however, of the pharmacy of ancient China. The author states "We know less about the pharmacy of ancient China than we do of that of either the Egyptians or Babylonians. This is probably because the Chinese have always been uncommunicative and secretive to an unusual degree, and because there has been less research into the ancient literature of the living nations than into the literature of races that have disappeared." This is, unfortunately, only too true, and the fact constitutes a challenge, or opportunity for those with the time and inclination in this direction, to delve into what the writer considers an

* Chengtu, W. China, Feb 16, 1935

nite principles which we must remember in order to better our condition by means of new legislation or by application of existing laws. Otherwise, our efforts may be wasted, for time spent in chasing rainbows is opportunity lost.

All power to make regulations for government lies in the people themselves, except such rights as the people have yielded in reconciliation of conflict. Much power has been delegated, yet far more has been retained than generally believed. The use of extraordinary powers by Congress during war time has led us to forget that Congress, after all, is a body of definitely limited authority. *Congress has only such power as the people have given it.* All the rest of the original power—call it what you will, natural, or divine—still resides in the people. This control the people have entrusted to the legislatures of their states, and within certain clearly defined limitations, the legislature is the voice of the people. Congress is not.

Too long has the national constitution been regarded as a God-given Mosaic law. It can serve the individual only by permitting *free* research in our local legislative laboratories. Only in this way can we realize that this country belongs to the living, that the dead have no power over it. By respecting the will of the state our national constitution will have fuller moral force and support.

Of what practical use to the pharmacist is this fundamental principle? Simply this: let us not, in our zeal for national legislation to correct existing evils, overlook the fact that the legislature of each state has at hand numerous methods for every one available to Congress. Consider the Police Power of the State. Every moment we feel its direct impact. By what right does the state tell us how poisons may be dispensed, where to park our automobiles, when to segregate infectious diseases, plus the many minor restrictions over our own home property—accumulation of refuse or prohibition of holiday explosives. All of these regulations certainly conflict with what a rugged individualist might consider inalienable rights. Yet even such an individualist, when his home is burning, heartily approves of the right of way to fire-engines. Again, the right to free speech is curbed. By what title are you restrained from spreading rumors concerning the status of a bank or a trust company? On inquiry we find that man may not talk as he pleases—that certain expressions of individualistic thought are antagonistic to social welfare—hence illegal. These legal norms rest upon the will of the people, an outgrowth of custom, expressed first in police regulations, later codified in state legislation.

With increased population and the development of modern machinery and newer methods of distribution and amusement, heretofore unheard-of dangers arise, and the people retain the right of pronouncement with respect to these hazards. For example, do we wish speed or safety in travel?

A generation ago speed laws were a joke, twenty-five years ago flying licenses were not required, twenty years ago no law-limited radio programs, ten years ago, despite the fact that many trade practices were in disrepute, no law prohibited their use. At present 99 per cent of us agree that such laws are essential. Five years ago, a Fair Trade law was a theory. We smiled and said, "Oh, yes, some day, mayhap, but not yet, lest we interfere with free exchange of goods." And yet to day, approximately one-half of the population of these United States is under a Fair Trade law. Nine states have tardily enacted a *modern type of statute*. Ten legislatures, within two years, have clearly seen that the legal force which protects the health of their children and the stability of our great financial institutions, which

prevents fire, pestilence, insurrection, the sale of impure foods and obscene literature, is the same power of the people which now undertakes to safeguard *the owner* of a twenty-million dollar trade-mark, as well as the little merchant who sells a tube of toothpaste so costly trade-marked

It cannot be over-emphasized that Fair Trade laws aim to serve the small shopkeeper with his small stock, just as much as they are intended to *protect owners* of million dollar trade-marks. And conversely, Fair Trade laws will protect the consumer, not merely indirectly by enabling the independent merchant to remain solvent and to maintain his position as a sustaining citizen, but by eliminating a multitude of fraudulent practices which follow "loss leader" advertising. These abuses are too well known among ourselves to require discussion, but the public's education on this subject has never received deserved attention.

Do you not get the right perspective?—A nation of almost 130,000,000 people, including a conservative estimate of 120,000,000 fair-minded citizens—Forget for the moment the 10,000,000, and bear in mind that there are 120,000,000 of us, *little folks*. We are The People. Aren't we, The People, entitled to determine under which laws we'll live? Now you and I have *the requisite power*. Let's use it! If we do not, I foresee cataclysmic upheavals because of our very stupidity.

When the glib salesman of an unfair manufacturer or a sleek competitor gabs about constitutional law and talks of Fair Trade laws as the bunk, don't discuss the matter. You need not get on the defensive. Simply state: "I'm sorry, Mister, but I've studied law myself, and I'm too busy to argue with anyone who hasn't."

The Greeks had a word for it, and let me refresh your memory—no people better understood the value of local rule in relation to law, for which they had profound respect. Government was The People. DEVELOPMENT OF PHARMACY IN WEST CHINA

BY E. N. MEUSER *

"Four Thousand Years of Pharmacy" gives an exceedingly interesting account of the ancient history of Egyptian and Babylonian pharmacy. Comparatively little mention is made, however, of the pharmacy of ancient China. The author states: "We know less about the pharmacy of ancient China than we do of that of either the Egyptians or Babylonians. This is probably because the Chinese have always been uncommunicative and secretive to an unusual degree, and because there has been less research into the ancient literature of the living nations than into the literature of races that have disappeared." This is, unfortunately, only too true, and the fact constitutes a challenge, or opportunity for those with the time and inclination in this direction, to delve into what the writer considers an

* Chengtu, W. China, Feb 16, 1935

exceedingly fascinating study of Chinese pharmaceutical lore reaching back into forgotten ages. The written history resulting from such a study would be a very valuable contribution indeed. The ancient type of Chinese medicine shop conducted by a combined pharmacist-physician continued fairly general until the arrival in China of the medical missionary and the representatives of Western pharmaceutical manufacturing houses. With the introduction of Western medicines there has been a gradual transformation of the old-time, small, floorless drug shop with its miscellaneous assortment of crude native drugs of animal and vegetable origin cluttering the walls, ceiling and counter, to the modern type of drug store—larger, cleaner, bright and airy, and with a great variety of drugs, chemicals,

The first class of pharmacists to graduate from any University in China—June 1934 of the Department of Pharmacy of the West China Union University Chengtu, W China

Second row Dr Beech Chancellor of University, Dr Djang President of University, Miss Foster, Dean of Woman of University, Dr Meuser Head Department of Pharmacy of University, Mr Chang Dean of Science of University

surgical supplies, chemical apparatus and patent medicines on display, and with quite up-to-date drug store fixtures and furnishings

Unfortunately, in most cases these drug stores are in charge of people who have not had pharmaceutical or medical training, and there is, therefore, the promiscuous buying and selling of Chinese and foreign drugs, potent, poisonous and otherwise. This obviously constitutes a real danger to public health. The Chinese Government Ministry of Health, realizing this danger, has prepared considerable legislation governing the practice of pharmacy in China. It provides for the sale of medicines and the dispensing of prescriptions by pharmacists only who have the necessary qualifications. It also endeavors to provide for efficient dispensing of medicines in hospitals by stipulating that there shall be qualified pharmacists on the staff of all hospitals.

Because of the great amount of medicine required in so vast a population as that of China, and the fact that China produces such a tremendous variety and abundance of crude drugs, the task of research in these crude drugs and the subsequent manufacture into modern medicines calls for the services of many trained pharmacists

Obviously, without schools of pharmacy in which to train these pharmacists, neither this important work of research and manufacture nor the enforcement of the laws of the Central Government, as just mentioned, can be carried out for the time being. However, in order to try to meet these needs a few schools of pharmacy have been opened in different parts of China during the past three years. Not the least important among these schools recently opened is the Department of Pharmacy in the West China Union University, Chengtu, W. China. In this Department a course of four years of instruction is given leading to the degree of Bachelor of Science in Pharmacy (B. S. in P.).

When the Department of Pharmacy of the W. C. U. U. was opened in the Fall of 1932, there was an enrollment of sixteen students in the first year. In addition to these, there were four other splendid students who had already completed two years of studies in Science and who transferred from other departments and registered in the third year of pharmacy. In June 1934, therefore, these four students, having finished their studies, had the unique distinction of being the first class of pharmacists to graduate from any University in China. This is but the beginning of other and larger classes to follow. These graduates are now doing splendid work in their respective positions.

In 1934 the Central Government of China, at Nanking, showed its general interest in the development of pharmacy in China, and its special interest in and recognition of the Department of Pharmacy of the West China Union University by making a grant of five thousand dollars (\$5000.00 Chinese) toward the purchase of equipment for the department. This, naturally, was highly appreciated, as it enabled us to secure some of the apparatus most urgently needed.

Then, also, the department was the recipient of a further gift of what is expected to be an annual sum of money from a well-known firm of pharmaceutical chemists in Germany toward equipment and salary of an assistant teacher. This, too, was much needed and was gratefully received.

While these grants have given pharmacy in West China a good start, further financial cooperation will be constantly needed for maintenance.

As an industrial profession, modern, scientific pharmacy has a real, vital, missionary service to render to China. In its various phases of work, such as research in crude drugs, manufacture of medicines, hospital dispensing and private practice, it offers in a very practical way a workable solution for some of China's economic problems by giving pleasant and remunerative employment to those engaged in the profession, while at the same time rendering a materially helpful service to the public.

The future prospects for the Department of Pharmacy of the West China Union University are quite encouraging, and those of us engaged in this work count it a privilege to have a share in this phase of God's great work in China. We shall be glad to hear at any time from friends interested in our work here.

THE DEPARTMENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

C B JORDAN—CHAIRMAN OF EXECUTIVE COMMITTEE, A A C P, EDITOR OF THIS
DEPARTMENT

Your Editor is pleased to offer to the College Section the following paper by Professor Walter Crosby Eells, a well known and authoritative writer on the center of population of various phases of education. All of us expected the center of population of pharmaceutical education to move westward as more colleges of pharmacy were established west of the Alleghenies, but I doubt that any of us expected the sharp reversal as indicated in the past decade.

In Professor Eells' contribution there is food for thought for every executive and teacher of Pharmacy—C B JORDAN, *Editor*

THE CENTER OF POPULATION OF PHARMACEUTICAL EDUCATION, 1870-1930

BY WALTER CROSBY EELLS *

The *center of population* is defined by the United States Census Bureau as "the point upon which the United States would balance, if it were a rigid plane without weight and the population distributed thereon, each individual being assumed to have equal weight and to exert an influence on the central point proportional to his distance from the point." In other words it is the center of gravity of the weighted plane or a two-dimensional average of the population.

The determination of this point at the regular decennial census intervals is the best method that has been devised by the Census Bureau to trace compactly the rate and direction of general movements of the population. The first official computation of this point was made under the direction of Francis A. Walker, superintendent of the ninth census, for publication in the first statistical atlas of the United States published in 1874.¹ At that time the position of the center of population was computed for each census year since 1790.

So convinced has the Census Bureau become of the value of this mode of summarizing population trends that in later years it has made much more extensive use of the same method. In 1910 the positions of the center of population since 1880 for each state were computed. In 1920 the method was further extended to include centers of foreign-born population, of Negro population, of urban and rural population, and even to determine centers of agriculture, of manufacturing, of number of farms, of farm area, of improved acreage, of value of farm property, and of the production of corn, wheat, cotton and oats.²

* Professor of Education Stanford University

¹ Walker, Francis A. (Compiler) 'Statistical Atlas of the United States Based on the Results of the Ninth Census.' Washington, 1874, page 5. For an earlier unofficial computation and other information regarding history of the center of population see Eells, Walter Crosby, "The Center of Population—a Prophecy and Its Fulfilment," in *The Scientific Monthly* 20 78-84, January 1925.

² Sloane Charles S. (Compiler), 'Center of Population and Median Lines and Centers of Area, Agriculture, Manufactures and Cotton.' (Fourteenth Census of the United States, 1920) Washington, 1923, pages 12-41.

Why not then educational centers of population as well? A method which has proved so valuable in summarizing movements of general population should be equally valuable in studying the movements of the higher educational population—the student enrollment in the colleges, universities and professional schools of the United States ¹ The object of this paper is to report and discuss the results of computations which have been made by the author to determine the *center of population of pharmaceutical education* for each census year from 1870 to 1930

METHOD OF COMPUTATION

The data upon which the computations are based were taken from the official reports of the United States Office (formerly Bureau) of Education ² These statistics are not perfect, but they probably are as accurate and reliable as are available The method used was the same as that of the Census Bureau, with the substitution of "states" (with their centers of population as computed by the Census Bureau) for "square degrees" as the unit of computation ³ The number of students of pharmacy involved for each census year is as follows

1870	440
1880	1,347
1890	2,871
1900	4 042
1910	6 226
1920	5,026
1930	10,906

It is noteworthy, although not directly pertinent to this study to observe that the reported number of students of pharmacy more than doubled between 1920 and 1930

LOCATION OF CENTERS

The latitude and longitude and approximate location of the center of pharmaceutical education for the seven different decennial years, 1870–1930, are shown in Table I and on the map of Fig 1 The map also shows the location of the general

¹ For two such studies, see Walter Crosby Eells, "The Center of Population of Higher Education" *School and Society* 24, 339–344 (September 11, 1926), and "The Center of Population of Engineering Education 1900–1930," *Journal of Engineering Education*, 25, 662–669 (June 1935)

² Reports of the Commissioner of Education 1870, page 524, 1880, page 154, 1889–1890, page 1023, 1899–1900, 2, page 1973, 1910, 2, page 1034 Biennial Survey of Education, 1918–1920 (*Bulletin*, 1923, No 29), page 294, Biennial Survey of Education, 1928–1930 (*Bulletin*, 1931, No 20), pages 349–350

³ "In making the computations for the location of the center of population it is necessary to assume that the center is at a certain point Through this point a parallel and a meridian are drawn, crossing the entire country The product of the population of a given area by its distance from the assumed parallel is called a north or south moment and the product of the population of the area by its distance from the assumed meridian is called an east or west moment In calculating north and south moments the distances are measured in minutes of arc, in calculating east and west moments it is necessary to use miles on account of the unequal length of the degrees and minutes in different latitudes The population of the country is grouped by square degrees—that is by areas included between consecutive parallels and meridians—as they are convenient units with which to work"—SLOANE, CHARLES S, *loc cit*, page 5

center of population of the country for the same dates. The abbreviation "C S" in Table I indicates that the town named is the county seat of the county in which the given center is located.

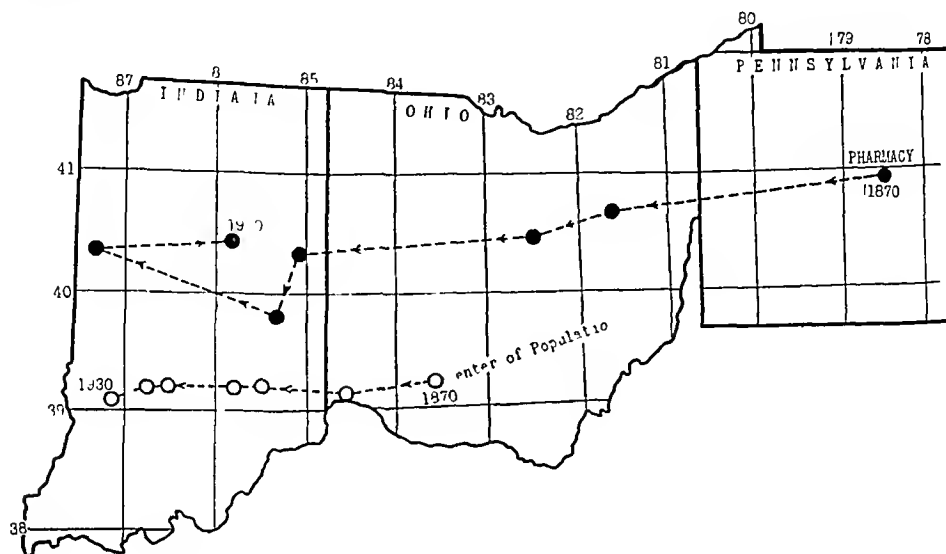

Fig 1—Movement of centers of population of pharmaceutical education and of the general population, 1870-1930

TABLE I—LOCATION OF CENTERS OF POPULATION OF PHARMACEUTICAL EDUCATION, 1870-1930

Year	Latitude North	Longitude West	State	County	Distance from Important Cities and Towns
1870	40° 56'	78° 33'	Penna	Clearfield	84 miles N E of Pittsburgh 8 miles S W of Clearfield, C S
1880	40 39	81 39	Ohio	Holmes	31 miles S of Akron 15 miles N E of Millersburg C S
1890	40 24	82 30	Ohio	Knox	39 miles N E of Columbus 1 mile N W of Mt Vernon, C S
1900	40 21	85 02	Indiana	Jay	22 miles N E of Muncie 6 miles S W of Portland, C S
1910	39 50	85 20	Indiana	Henry	23 miles S of Muncie 7 miles S E of Newcastle, C S
1920	40 21	87 20	Indiana	Warren	58 miles N of Terre Haute 4 miles N W of Williamsport C S
1930	40 25	85 49	Indiana	Grant	48 miles N E of Indianapolis 12 miles S W of Marion, C S

The most outstanding fact shown is the rapid shift westward during the half century from 1870 to 1920 of the center of population of pharmaceutical education—a total of 463 miles in only fifty years. This movement carried it from a point in Western Pennsylvania across Ohio and Indiana almost to the Illinois line. It is surprising to note, however, the sharp reversal of a half century's trend in its sudden movement eastward from 1920 to 1930 of 80 miles back into the eastern part of Indiana. The trend has been steadily southward for the first forty years, but in the past two decades it has shifted northward again although still more than 30 miles south of its 1870 position. The movement of the center of population for education in pharmacy, in miles for each decade, is summarized in Table II.

TABLE II—MOVEMENT OF CENTER OF POPULATION OF PHARMACEUTICAL EDUCATION, 1870-1930
(In Miles during the Preceding Decade)

Year	From Point to Point in a Straight Line	Northward	Southward	Eastward	Westward
1880	162 9		16 7		162 0
1890	47 1		14 7		44 8
1900	133 5		3 2		133 5
1910	35 0		31 2		15 9
1920	110 6	31 2			106 1
1930	80 0	3 9		79 9	
Totals (net)			30 7		382 4

Reference to the map of Fig. 1, shows that the center of population of pharmaceutical education has always been north and with one exception (1920) has also always been east of the center of general population for corresponding years. While the center of general population has moved westward only 190 miles in six decades, the center of pharmaceutical education shifted westward 462 miles in the first five decades. Even if the 80-mile eastward shift of the last decade be taken into account, the 1930 position is more than twice as far from its 1870 position as was the case for the general population. Westward the Course of Empire has taken its way, but far more rapidly for students of pharmacy than for the general population. The north and south distance between the two centers, which was 120 miles in 1870, had decreased to 93 miles in 1930. Relative to the distribution of the general population, there always has been a much greater emphasis on education in pharmacy in the North than in the South, and except in 1920 in the East than in the West. Viewed as a whole, however, the East has lost much of its earlier primacy in the field of pharmaceutical education.

What the situation will be in 1940 is problematical. The general center of population will doubtless be at or near the Indiana-Illinois line. Whether the pharmaceutical center will continue eastward, or will reverse itself again and continue its general westward trend is an open question. It seems doubtful, however, whether it will move entirely out of Indiana by 1940.

Such facts as are presented in this paper, summarizing long time trends, may furnish food for thought and speculation on the part of those responsible for the education of the pharmacists of the future.

MEDICAL MILE-STONES

"The Medicine Man of the American Indian and His Cultural Background" is the rather lengthy but arresting title of a recent study by Dr. William Thomas Corlett, professor emeritus after long service on the Faculty of Medicine of Western Reserve University. The Indian tribes included in the study inhabit or have inhabited the lands from the Arctic Circle

to Terra del Fuego and from the Atlantic to the Pacific Oceans. Although some of the information in the volume has been acquired by the author through first-hand contacts, much of it is the result of careful study and research into records, histories and other documents. A valuable bibliography covers eighteen pages and includes publications in six languages dated from 1510 to 1934.—From *Medical Milestones*, September 4th

THE DEPARTMENT OF THE NATIONAL ASSOCIATION OF BOARDS OF PHARMACY

H C CHRISTENSEN SECRETARY 130 NO WELLS ST CHICAGO, ILL

SYNOPSIS OF PROCEEDINGS OF THE THIRTY-SECOND ANNUAL CONVENTION OF THE NATIONAL ASSOCIATION BOARDS OF PHARMACY HELD IN PORTLAND, OREGON, AUGUST 5-6, 1935

The thirty second annual meeting of the National Association of Boards of Pharmacy made an exceptionally good attendance record for the first meeting to be held in the Pacific Northwest—32 states were represented by 59 delegates, with 7 honorary members (former board members) in attendance

President Charles Hall Evans (Georgia) appointed the following Credentials Committee E E Magee (Oregon) *Chairman*, A L I Winne (Virginia), John K Clemmer (Florida)

The following delegates responded to Roll Call

Alabama L C Lewis	Nevada R W Fleming, E B Loring, H M Skeels
Colorado, Arthur D Baker, Wm J Bishop	New Hampshire, P J Callaghan, George A Moulton
Connecticut, Edward J Murphy, Hugh P Bierne, George Blackall, Charles Gustafson, Wm J Dunphy	New Jersey, R P Fischelis
District of Columbia, C J Fuhrmann or Samuel L Hilton (proxies)	New York, F C A Schaefer, Hugo Schaefer
Florida, W M Hankins, John K Clemmer	North Dakota, P H Costello, E P Martin
Georgia, Charles Hall Evans	Ohio, M N Ford, F H King
Idaho F L Christenson	Oklahoma W D Patterson, Ned Milligan
Indiana Edgar A O'Harrow	Oregon E E Magee John F Allen, M E McKee M C Kaegi, Frank C Berg, Linn E Jones
Iowa, George W Gillman, George Judisch	Pennsylvania L L Walton
Kansas, Joe Paradowsky, Mac Childs, Frank Milne, Pat Mulligan, Walter Varnum	Puerto Rico H C Christensen (proxy)
Kentucky, J W Gayle	South Dakota, H J Schnaidt, E C Severin
Maine, Leon H Marr, Adolphe L Rivard	Tennessee Geo W Lamar
Maryland, Robert L Swain	Texas Roy Phillips
Minnesota Wm C Muesing, Edw J Prochaska	Virginia A L I Winne
Massachusetts Timothy S Shea	Washington, Peter H Brady
	West Virginia Roy B Cook
	Wyoming R C Shultz

One hundred per cent attendance from Connecticut Kansas, Oregon

Honorary Members Albert Zimmermann, F Mortenson, Chas J Clayton, W P Porterfield, Chas H Avery, John Culley, C T Gilbert

John Culley introduced Secretary W M Fulton of the California Board of Pharmacy

Vice-President Shultz assumed the Chair during the reading of the Presidential Address

(See page 673, August JOURNAL, A PH A)

The following Committee on President's Address was appointed by Vice President Shultz R W Fleming (Nevada) *Chairman*, A D Baker (Colorado) Ned Milligan (Oklahoma)

SECRETARY'S REPORT

Secretary Christensen reported a cash balance in his accounts of \$2815 27 as of June 30, 1935, also the issuance of 613 reciprocal applications during the fiscal year The report included a review of the work of the central office in the legislative and examination fields, a study of repeat failures in board examinations, a description of the new administrative set up in Rhode Island, a complete report of the Nebraska situation where all reciprocity had been temporarily suspended on order of the N A B P Executive Committee early in June, a suggested plan under which

experience *since* registration can be counted when the applicant is short *prior* time, the details of the plan being submitted in resolution form and were referred to the Resolutions Committee

Treasurer J W Gayle reported funds totaling \$5389 86 in his accounts

EXECUTIVE COMMITTEE REPORT

Chairman A L I Winn read the report The mid year meeting had again been omitted on account of the expense

The report included a statement of income and expense from May 1, 1934 to June 30, 1935 (fourteen months), showing a cash increase of \$2339 58, with total cash assets of \$8205 13 as of July 1, 1935 The budget report showed that only \$13,848 14 had been spent of the \$14,400 00 appropriated—a saving of \$551 86

The question of date of removal of the offices of the Association to the American Institute of Pharmacy in Washington was considered and a motion adopted that the date be left entirely to the discretion of Secretary H C Christensen Certain financing is necessary to cover the cost of removal, refurnishing of the new offices, etc , also Secretary Christensen is needed in Chicago to superintend the installation of the Pharmacy Exhibit of the World's Fair in the Rosenwald Museum of Science and Industry in Chicago as a part of the new Department of Medical Science which is being planned, therefore a definite date could not be set at this time

The Executive Committee approved the resumption of reciprocal relations with Nebraska on the basis outlined in a letter received from Dr P H Bartholomew, Acting Director of the Nebraska Department of Health, which provides that the N A B P preliminary blank is to be mailed out by his Department on all inquiries with a special letter (as per copy submitted by him) explaining the Nebraska situation under the present law, with the understanding that the Nebraska law is to be amended at the next legislative session so that the usual N A B P procedure can be legally carried out

A budget totaling \$15,250 00 was adopted by the Executive Committee for the ensuing fiscal year 1935-1936

COMMITTEE REPORTS

The *Advisory Examination Committee* report dealt primarily with statistics that had been collected by the Chairman H C Christensen, on the repeat failure problem His conclusion, based on this information was that the problem was not serious enough in pharmacy, on account of the high entrance requirements for the board examinations, to warrant limiting the number of permissible failures to three

Mac Childs (Kansas) presented a *Legislative Committee* report that covered 47 states—a record in completeness He expressed himself as being personally opposed to the principle of limiting the sale of barbituric acid derivatives and other hypnotics to physicians' prescriptions, a type of restriction now gaining popularity He deemed registration of the sale by the pharmacist, with a precaution against misuse, a sufficient public safeguard

R L Swain (Maryland) delivered a most comprehensive report on the *National Legislative* situation covering in detail the Copeland bill S 5 to amend the Federal Food and Drugs act, a proposed act regulating the practice of pharmacy in the District of Columbia, and several bills with regard to the Medical Department of the U S Army which are of interest to pharmacy A recommendation approving S 5 was included in the report, which was referred to the Resolutions Committee

Chairman W M Hankins (Florida) of the *Grievance Committee* reiterated the report of previous years—no grievances reported

Secretary H C Christensen in his report as chairman of the *National Certificate Committee* briefly reviewed previous attempts to establish a national certificate and then outlined a plan for future consideration by the boards which he believed workable Details will be published in the proceedings

Roy Bird Cook (West Virginia) as Chairman of the *Committee on Pharmaceutical Jurisprudence* had contacted all the boards on the subject of making this a written and compulsory examination subject The answers revealed that few boards were now giving this as a written subject, that others preferred to keep it as part of the oral quiz, and that many were not in favor of making it compulsory R P Fischelis (New Jersey) a member of the committee, did not agree

with the conclusions of the committee so his separate statement was read The report of the committee was accepted, however, and the committee continued

R L Swain (Maryland) reported for the *Committee on Code Matters*, which had had little opportunity to function on account of the unconstitutionality of NRA In view of the fact that a skeleton organization of NRA is being retained, he recommended that the committee be continued in case something should come up later that requires action

Unfortunately A C Taylor (District of Columbia) chairman of the *Committee on Minimum Standards of Technical Equipment for Pharmacies* was not present at the meeting He sent in a detailed report, however, covering the two years of activity of the Committee The report concluded with a recommendation that the N A B P endorse the establishment of such standards and urge member boards to adopt them The recommendation was referred to the Resolutions Committee

As Chairman R W Fleming of the *Committee on President's Address* had been called home from the meeting by wire Arthur D Baker (Colorado) delivered the report, highly complimenting the president on his splendid address

DISTRICT REPORTS

Very interesting reports on the work of the various districts were delivered by Vice-President George Moulton (No 1), Acting Chairman Mac Childs (No 6), and Vice-President Shultz of District No 7 reported that a conference of the Western boards would be held on Wednesday morning after the close of the N A B P sessions at Portland In the absence of Vice President Woodside R L Swain reviewed the work of District No 2

R L Swain as Director of the Department of Education urged continuation of the Department, although no funds were available during the year just completed for that work

L C Lewis (Alabama) delivered a very moving tribute to the memory of Dr W E Bingham, much loved secretary of the Alabama Board and the first honorary president of the N A B P who had passed on to his reward during the year

RESOLUTIONS COMMITTEE

As none of the standing members of the Resolutions Committee were present at the meeting and only two members of the Committee on Constitution and By-Laws President Evans combined these committees and asked L C Lewis, R W Fleming and R L Swain to serve

The report of the Committee, with the exception of one resolution which was deleted, was accepted The following are the adopted resolutions

No 277 *Resolved*, that in the interest of bringing about closer cooperation between states, every board of pharmacy should be represented at the annual N A B P convention Where the state treasury allows no such budget, the state pharmaceutical association should make some provision for sending a board delegate to represent the interests of the pharmacists of that state Where neither the state treasury nor the pharmaceutical association can assume this expense, some consideration should be given to the willingness of board members personally to make such a sacrifice when the appointment lists are made up but not overlooking the fact that fitness as an examiner should be the first consideration

No 278 *Resolved* by the National Association of Boards of Pharmacy that the Federal Food and Drugs Act is not sufficiently broad to afford the public the necessary protection in the matter of foods, drugs, and cosmetics, and that there exist pressing reasons for new legislation on this subject,

Resolved further, that it is the opinion of the N A B P that the present draft of Senate Bill No 5 meets the existing situation in a reasonably satisfactory manner and the passage of the bill is urged at this session of Congress

No 279 *Resolved*, That all member boards be urged to send copies of all bills introduced in the respective state legislatures which affect pharmacy either favorably or unfavorably to the central office of the N A B P so that they may be studied as well as being made available to the boards of all states

Be it further resolved, that all legislation sponsored by boards be submitted for suggestion and criticism so that state legislation bearing upon pharmacy may be made as uniform as possible

No 280 *Resolved* by the National Association Boards of Pharmacy that in the interest

of public health, all pharmacies be required to possess the equipment and apparatus necessary to proper compounding of physicians' prescriptions as well as the general practice of pharmacy and that each member board be urged to secure legislation authorizing it to prescribe the minimum for such technical equipment and

Resolved further, that a Committee be continued in the N A B P to advance the purposes of this resolution and to act as advisors in the matter to the various state boards

No 281 Recognizing the necessity for a full understanding of the conditions under which pharmacy is practiced in the various states as furnishing the soundest basis for pharmaceutical legislation as well as giving the strongest support to a program for pharmaceutical betterment, *resolved*, that the National Association Boards of Pharmacy sponsor a study of economic and professional conditions in each state, the study to consist of a questionnaire to be prepared by the central office and to be issued in each state by the respective board of pharmacy for the purpose of establishing reliable data upon the following (1) the number of drug stores in the state, (2) population of the state, (3) ratio of drug stores to population, (4) volume of drug business, (5) amount of prescription work, (6) the number of new drug stores opened within the year, (7) the number of registered pharmacists, (8) the number of unregistered employees, (9) the number of students of pharmacy in state, (10) ratio of students to the number of existing stores, (11) a statement of those registered by examination over a ten-year period so that trend in registration may become known, (12) defects in existing pharmacy laws and suggestion for their improvement, (13) and all such other data as may be considered helpful,

Resolved further, that the scope of this study may be extended or restricted as the judgment of the President and the Secretary of the N A B P may dictate,

Resolved further, that the president is authorized to appoint a special committee to carry out this study if he deems it desirable

The report of the Standing Committee on Resolutions, which had been prepared in advance covering the district resolutions, was then read and received on motion No action was taken on the individual resolutions therein contained, as none of the committee members were present and few of the district chairmen to lead in the discussion of the matters presented

PRESENTATION OF PLAQUES

Chairman J A J Funk (Indiana) of the Committee on Plaques was not present at the meeting therefore the presentation was made by Mac Childs of Kansas, who originally made the suggestion that the N A B P present a scroll or plaque to each of the four officers of the Committee on Pharmacy Exhibit (Chicago World's Fair, 1933-1934) to show its appreciation of the work done by these men in bringing the message of pharmacy to the public so effectively

The recipients were H C Christensen *Chairman*, Julius H Riemenschneider, *Treasurer*, Frank B Kirby, *Secretary*, and Dr A S Burdick, *Vice President* (deceased), presentation to be made to the widow

AMENDMENT OF THE CONSTITUTION AND BY-LAWS

As required a suggested amendment to the Constitution and the By-Laws was read at the first session by Chairman L C Lewis, which was later changed in wording by motion at the final session and adopted as follows

ARTICLE IV, CONSTITUTION

Section 1A The officers of the Association shall be an *Honorary President*, a *President*, eight *Vice-Presidents*, a *Secretary* and a *Treasurer*, elected annually and who shall hold office until their successors shall be elected and shall have qualified

ARTICLE II, BY-LAWS

Clause (e) He must have passed an examination in at least Pharmacy, Chemistry, Materia Medica, Pharmaceutical and Chemical Mathematics and Practical Work, obtaining not less than 75% on Practical Work and not less than 75% general average with not less than 60% in any one branch (Effective June 1936, as previously adopted)

ELECTION

A L I Winne (Virginia) reported for the Credentials Committee that the roll and the credentials had been examined and found in satisfactory order

The Nominating Committee, which consisted of George A Moulton (N H) *Chairman*, Walter Varnum (Kan), Linn E Jones (Ore) R C Shultz (Wyo), and W M Hankins (Fla) delivered the following report for consideration *Honorary President*, F H King, Delphos, Ohio *President*, Mac Childs, Eldorado, Kan, *Secretary*, H C Christensen, Chicago, Ill, *Treasurer* J W Gayle Frankfort Ky, *Member Executive Committee* Chas Hall Evans, Warrenton, Ga, *Member Syllabus Committee*, Walter H Cousins, Dallas, Tex, *Member Resolutions Committee* Arthur D Baker, Denver, Colo *Vice Presidents* District No 1, George A Moulton, Peterboro, N H, No 2, John M Woodside, Philadelphia, Pa, No 3, John K Clemmer, Miami Fla, No 4, Earl Durham, Corunna, Mich No 5, Wm Muesing, New Ulm, Minn, No 6 E E Weaver Ft Worth, Tex No 7 R C Shultz, Worland Wyo, No 8 John F Allen, Corvallis Ore These officers were duly elected by the unanimous ballot of the Association cast by George Judisch (Ia) who had been particularly selected for the honor, inasmuch as the secretary was a candidate himself

After installation of officers the meeting adjourned (Report of Joint Session with Colleges will be published in annual proceedings, details not yet available)

ASSOCIATION BUSINESS

AD INTERIM BUSINESS OF THE COUNCIL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 1935-1936

Office of the Secretary 2215 Constitution Ave Washington, D C

LETTER NO 3

September 21 1935

To the Members of the Council

20 *Resignation of E Fullerton Cook as a Nominee for the Presidency* In addition to the letter addressed to the Secretary on September 14th by Dr Fischelis copies of which were sent to members of the Council, a letter has been received from Dr Arny of which copy is attached (To members of the Council)

There is also attached copy of a letter addressed to Dr Fischelis on September 18th, submitting information about the action taken with respect to previous requests from nominees (To members of the Council)

Because of the necessity for an early decision if the ballots are to be sent out within the time required by the By Laws, the secretary discussed the situation with Professor Cook over the telephone on September 20th and Professor Cook repeated the request that the resignation be accepted for the reasons given in his letter

The chairman of the Council requests that the announcement be made that a vote will be called for on Motion No 1 on Saturday, September 28, 1935

21 *Sale and Exchange of Liberty Bonds* Motion No 2 (Council Letter No 2 page 804) has been carried and the Liberty Bonds referred to have been deposited for exchange at par for Treasury Bonds, 2 $\frac{3}{4}$ %, 1945-1947 dated September 15, 1935

Dr Fischelis commented as follows in writing Yes as a temporary expedient, effort should be made to find more remunerative investments as soon as possible

22 *Minutes of the First Meeting of the Council* Copies of the minutes of the First and Second meetings of the Council at Portland are being sent under separate cover

(Motion No 3) *It is moved by Eberle that the minutes as given in Council Letter No 1 be approved*

23 *Report of Committee on Resolutions* A reprint of this report as it appears in the August issue of the JOURNAL, is being sent under separate cover for the convenience of the members of the Council

Attention is directed to those recommendations and resolutions which were referred to the Council for consideration or action These will be referred to in later Council Letters

24 *Applicants for Membership* The following applications properly endorsed and accompanied by the first year's dues have been received

No 1, Everett Carl Crist, Mission City, B C, Canada, No 2, Justus C Ward, 526 Customs House, Denver, Colo, No 3, Arthur H Neumann, 4821 W North Ave, Milwaukee, Wis, No 4, E O Klein, Farmington, Missouri, No 5, Hamilton Cameron, 5406 Connecticut Ave, Washington, D C, No 6, C R Brogan, 600 W Pico, Los Angeles, Calif, No 7, Geo A Moulton, Peterborough, N H, No 8, Ferdinand Benjamin Zienty, 4861 Cornelius Ave, Chicago, Ill, No 9, August Ulrich, 4715 McCasland Ave, East St Louis, Ill, No 10, Mariko Nishio, Box 667, Milwaukee, Oregon, No 11, Joseph H Ammirat, 6295 Third St, San Francisco, Calif, No 12, Edgar P Martin, Hazen, N Dak, No 13, Paul Reznek, 1228 Eyc St, Washington, D C, No 14 Aaron Engel, 19 Cumming St, New York, N Y, No 15, Stanley G Halley, Star Lake Ave, Bloomingdale, N J

(Motion No 4) *Vote on applications for membership in the American Pharmaceutical Association*

E F KELLY, *Secretary*

LETTER NO 4

September 28 1935

To the Members of the Council

25 *Resignation of E Fullerton Cook as a Nominee for the Presidency* In accordance with the notice given in Council Letter No 3, preceding letter, a vote is called for on Motion No 1, Council Letter No 2, page 804 No additional comments have been received since the issuance of Council Letter No 3

26 *Minutes of the First Meeting of the Council* Motion No 3 (Council Letter No 3, page 876) has been carried and the minutes are approved as published

27 *Election of Members* Motion No 4 (Council Letter No 3, page 876,) has been carried and applicants numbered 1 to 15, inclusive, are declared elected

28 *Applicants for Membership* The following applications properly endorsed and accompanied by the first year's dues have been received

No 16, Carroll Cornwall, 1927 Jackson St, San Francisco, Calif, No 17, Everett S Ostrum, 1432 Fifth Ave, San Francisco, Calif, No 18, Herbert H Gerding, 3414 Fairfield Ave, Ft Wayne, Ind, No 19, Max L Miller, 415 W Durham Rd, Philadelphia, Pa, No 20, Fred E Lehman, 6758 Paschall Ave, Philadelphia Pa

(Motion No 5) *Vote on applications for membership in the American Pharmaceutical Association*

E F KELLY, *Secretary*

LETTER NO 5

October 5, 1935

To the Members of the Council

29 *Resignation of E Fullerton Cook as a Nominee for the Presidency* Sixteen of the eighteen members of the Council have returned voting cards on Motion No 1 (Council Letters Nos 2 page 804, 3 page 876, and 4, page 877) Eleven voted "yes," three voted "no" and two did not vote The motion has therefore, been carried and the resignation is accepted

The following notation will appear on the ballot as was done previously in similar cases "Note by the secretary—Professor E Fullerton Cook of Philadelphia, Pa, was nominated for president but his name was withdrawn at his request and by permission of the Council"

The ballots will be dated October 15, 1936

30 *Election of Members* Motion No 5 (Council Letter No 4, preceding letter) has been carried and applicants numbered 16 to 20, inclusive are declared elected

31 *Appointment of Committees, etc* President Costello has made the following appointments (see A PH A JOURNAL, August 1935, page 707)

Committee on Pharmacy Corps in U S Army—F L McCartney, Chicago, Ill, is added to membership *Committee to Draft Model Act Restricting Distribution of Drugs and Medicines to Pharmacists*—F E Mortenson, Los Angeles, Calif is added to membership *Committee on Development of Pharmacy Laws*—R L Swain, *Chairman*, Baltimore, Md, R P Fischelis Trenton,

N J, Geo W Mather, Albany, N Y, H C Christensen, Chicago, Ill, Rowland Jones Jr, Washington, D C, M W Fulton, San Francisco, Calif, P H Dirstine, Pullman, Wash *Committee on Transportation*—R A Kuever, Iowa City, Iowa, replaces H C Newton *Councilors to American Association for the Advancement of Science*—John C Krantz, Jr, Baltimore, Md, and A F Schlichting, Ferguson, Mo *Committee on Endowment Fund*—Dr J H Beal has requested to be relieved as a member and as Chairman of the Committee Dr Wm B Day is designated as *Chairman* and Dr F J Wulling Minneapolis, Minn, as a member of the Committee *Committee to Study Constitution and By Laws*—R L Swain, *Chairman*, Baltimore, Md, W B Day, Chicago, Ill, J H Beal, Fort Walton, Fla, R P Fischelis, Trenton, N J, E F Kelly, Washington, D C *Committee to Study Courses in the History of Pharmacy*—C O Lee, *Chairman*, La Fayette, Ind, E J Ireland, Madison, Wis, Lloyd E Harris, Norman, Okla *National Committee on Professional Information Pertaining to Dental Pharmacy*—George C Schicks, *Chairman*, Newark, N J, A O Mickelsen Portland Oreg, R W Clark Madison Wis, A R Bliss, Birmingham Ala, R E Terry, Chicago, Ill
E F KELLY, *Secretary*

UNITED STATES PHARMACOPŒIA

ABSTRACT OF PROPOSED CHANGES WITH NEW STANDARDS AND DESCRIPTIONS

ELEVENTH REVISION

Copyright 1935 by the Board of Trustees of the United States Pharmacopœial Convention *
All Rights Reserved

PART V—BOTANY AND PHARMACOGNOSY

The Pharmacopœial Convention of 1930 recommended that 'abstracts of changes proposed for the U S P XI and new standards and descriptions' be published before final adoption, that those who are not members of the Revision Committee may have an opportunity for comment and criticism

In compliance with this recommendation the following abstracts are submitted The nomenclature and the exact wording does not necessarily represent that to be finally adopted

Changes in assays and strengths will be found in Part II, on Proximate Assays

Comments should be sent to the chairman of the Revision Committee

E FULLERTON COOK,
43rd and Woodland Avenue,
Philadelphia, Pa

Acacia—The standard for purity has been changed by the addition of an ash requirement—'not more than 4 per cent of total ash and not more than 0.5 per cent of acid insoluble ash'

Under "*Powdered Acacia*" the sentence on solubility has been altered—'at room temperature' being inserted after 'cold water' and 'resulting' inserted before 'solution'

In the "*Test for identity*," the nature of the precipitate has been changed from 'gelatinous' to 'flocculent or curdy, whitish' A polariscopic test has been added, viz, "A 10 per cent aqueous solution of *Acacia*, when examined by the polariscope, shows but slight laevorotation"

Under the *Tests for purity* the starch and dextrin tests have been amplified by specifying the strength of the *acacia* solution and requiring it to be boiled and cooled before the addition of iodine T S

A test for the water insoluble residue has been added

Aconitum—The description has been broadened so as to include subspecies and varieties of *Aconitum Napellus*

Agar—'Fam *Florideæ*' has been added after "*Gelidium*" in the definition

The moisture content in the purity rubric has been increased to 18 per cent

The description has been altered to specify Japanese *Agar* as the kind containing frustules of *Arachnoidiscus Ehrenbergii*

* Permission to reprint for purposes of comment can be had on application to the Chairman of the Board of Trustees, James H Beal Fort Walton, Fla

Tests for identity A solubility and jelly test have been made a part of the "Tests for identity" "The color of the fragments treated with iodine T S" has been amplified to read "with some areas reddish or violet"

A new picric acid test for gelatin has been added

Aloe—Cape Aloe has been dropped from this monograph

Althæa—There is an added requirement that *Althæa* contain "not more than 1 per cent of foreign matter" Under 'Unground *Althæa*' the old statement "due to mucilage cells" has been changed to read "with mucilage cells"

Amylum—Under "Description and physical properties," "lenticular" has been changed to read 'circular'

Aspidium—The phrasology under *structure* has been somewhat altered, including the change from 'glandular hairs' to "oleoresin glands," from "bundles bicollateral" to 'bundles xylocentric,' from 'tracheæ' to "tracheids"

Belladonna Folium—The titles of the drug have been changed from the plural to the singular number throughout

Changes under 'structure' including the following "usually with 3 neighboring cells" changed to read "with 3 or 4 neighboring cells," 'crystal cells large, filled with microcrystalline calcium oxalate' changed to read, "cells filled with microcrystals numerous," "Stem with long, thin walled, slightly lignified bast" changed to read "Stem, with long, thin walled, slightly lignified porycyclic fibers, bicollateral fibrovascular bundles, parenchyma interspersed with crystal cells, etc"

Powdered Belladonna Leaves Description slightly changed by introducing 'ellipsoidal' before "bordered pores" and deleting the terms 'bast' and 'wood' before fibers

Under the "*Tests for purity*" the test has been broadened to read "Rosette aggregates and raphides of calcium oxalate are absent in *Belladonna Leaf*, when present, adulteration is indicated"

Belladonna Radix—Under "*Powdered Belladonna Root*" the "bast fibers" have been changed to 'pericyclic fibers'

Benzoinum—The definition has been changed to specify '*Styrax tonkinensis* (Pierre) Craib ex Hartwich' as one of the sources of Siam Benzoin

The character of the odor of Unground Sumatra Benzoin is changed to read 'the odor suggests cinnamates or storax'

In the potassium permanganate test, "strong odor of benzaldehyde" replaces 'odor of benzaldehyde' The benzoic acid test has been altered in part to read "the residue is not less than 12.5 per cent"

Cannabis—The description of the structure of the stem and of the powdered drug have been made clearer by elaboration The term 'cystolith' replaces "calcium carbonate" in the description of the non glandular hairs

Cantharis—The description of the insect has been elaborated by changing 'legs with 5 tarsal joints' to 'the first and second pairs of legs with five tarsal joints, the hind pair with four tarsal joints, all with two distal claws' The description of the antennæ has been amplified also

Under Powdered *Cantharides* the dimensions of the spicules is changed to read "0.020 mm in width at the base"

Cardamomi Semen—External color of unground drug changed from 'reddish gray-brown' to "pale orange to dark brown" The words 'and slightly bitter' were added to the description of the character of the taste

The description of the structure of the seed is amplified to include the loosely attached membranous arillus and the more detailed description of the stone cells whose lumina contain silica

The powdered drug description is slightly amplified by clarifying the last clause relating to few pericarp fragments as allowable admixture

Carum—Caraway Fruit has been added as an additional synonym The description of the unground drug has been slightly altered by including a clause concerning the secondary ribs which occur between the primary ribs on the dorsal surface The description of the powdered drug has been slightly amplified to include the presence of few fragments of slightly lignified fibers

Caryophyllus—Unground Clove The description has been somewhat altered to conform

with the accepted modern interpretation relative to the stemlike portion of the clove bud which is now called the receptacle and which contains the inferior ovary

Cascara Sagrada—A requirement has been included that it contain not more than four per cent of foreign organic matter *Unground Cascara Sagrada* The color of the outer surface has been amplified to include purplish brown "

Structure The description of the cork has been changed to read "Cork yellowish brown, purple or reddish brown, up to 10 or more rows of small cells" Bast fibers in small bundles surrounded by crystal fibers" has been changed to read "bast fibers in small bundles, more or less surrounded by crystal fibers"

Tests for identity The wording of both tests has been slightly altered the colors resulting being respectively described as occurring in or of the mixture

Celaceum—*Definition* "A fatty substance" has been changed to read "A waxy substance"

Description The wording of the sentence dealing with solubility has been made more definite

Cinchona—The *definition* is changed to include both stem and root barks of Red and Yellow Cinchonas

The *description* is changed so as to include diagnostic features of root bark as well as stem bark

Cinnamomum—The purity standard is extended to permit not more than 2 per cent of foreign organic matter

Structure The description has been slightly altered, particularly in reference to the region of the pericycle where the term pericycle fibers has replaced "bast fibers"

Powdered Cinnamon "Bast fibers" has been changed to "fibers" and the waxy character of these is indicated, "fragments of somewhat lignified cork" has been added

Digitalis—*Standards of potency* This has been changed The potency of *Digitalis* shall be such that 0.1 Gm shall be equal to not less than 1 U S P digitalis unit It contains not more than 2 per cent of brown leaves stems flowers or foreign organic matter, not more than 8 per cent of moisture and yields not more than 5 per cent of acid insoluble ash Under all conditions of storage and transportation the drug should be kept in water proof and air tight containers A note has been introduced making it mandatory to dispense *Digitalis Pulverata*, when *Digitalis* is prescribed

Powdered Digitalis This subcaption has been changed to "Ground Digitalis" The description of the ground drug has been slightly changed The terminal cell of the uniseriate, non-glandular hairs is indicated as being pointed or occasionally rounded

Digitalis Pulverata A new article has been introduced, viz a standardized powdered digitalis

Definition *Digitalis* dried at a temperature not exceeding 60° C and reduced to a fine powder The strength of this article is to be such that 0.1 Gm shall be equal to not less than 1 and not more than 1.1 U S P digitalis units Powdered *Digitalis* of a higher potency is to be reduced to the official standard by admixture with the exhausted marc remaining when preparations of *Digitalis* have been prepared the marc being dried and finely powdered before mixing It contains not more than 5 per cent of moisture

Description Same as for Ground *Digitalis*

Storage Preserve *Digitalis* in water proof and air-tight containers

Ergot—*Purity standard* The standard of assay has been changed to read, "Ergot when assayed by the method directed below, possesses a potency, per gram, equivalent to not less than 0.5 mg of ergotoxine ethanesulfonate" An 8 per cent moisture limit has been introduced

Description and physical properties Under "Unground Ergot" the thickness has been changed to read "up to 5 mm thick" External features altered by addition of "occasionally transversely fissured" and color changed to "externally nearly black or purplish brown—internally white sometimes tinged with pink or gray"

Structure The description has been slightly amplified by adding "hyphal" before cells

Storage A paragraph has been introduced requiring Ergot to be kept in water proof and air-tight containers under all conditions of storage and transportation

Powdered Ergot The word "hyphal" has been inserted before "cells"

Eriodictyon *Definition* The author citation has been changed by dropping "Bentham"

Description Under "*Unground Eriodactylon*," the color of the upper surface has been amplified to read "yellowish to greenish brown." The character of the lower surface is changed to read "greenish to yellowish gray with greenish yellow or brown veins." The taste is changed to read "taste balsamic, bitter, becoming sweetish and slightly acid."

Under "*Structure*," "*Loose mesophyll*" has been changed to "*spongy parenchyma*." The character of the hairs occurring on the lower surface has been amplified.

Galla — *Definition* Changed to read "Nutgall is the excrescence obtained from the young twigs of *Quercus infectoria* Olivier and other allied species of *Quercus* (Fam. *Fagaceae*)."

Tests for identity have been added.

Gentiana — The purity requirements have been extended to include not more than 10 per cent of moisture, and not more than 2 per cent of foreign organic matter.

The description has been slightly altered to indicate the longitudinal wrinkling of the rhizomes and the twisted character of some segments of the rhizome and roots. The external color has been changed from yellowish brown to "generally dark brown occasionally light brown." The internal color has been changed to yellowish to orange brown.

The description of the powdered drug has been amplified to include fragments of cork and hypodermal cells.

A microsublimation test has been added.

Glycyrrhiza — The description of the internal structure has been partially rewritten and made more complete. Under Powdered *Glycyrrhiza* the width of the tracheæ is cited as "up to 0.200 mm in diameter." A new method has been introduced in the test for fatty matter.

Hyoscyamus — Under "*Structure*" calcium oxalate has been deleted following "micro-crystals." Under powdered *Hyoscyamus*, the description of the heads of the glandular hairs is changed to "multicellular."

Ipecacuanha — The Nicaraguan or reddish brown variety of Cartagena Ipecac has been added and changes made in the definition and description so as to include this commercial variety of the drug. The external color description of Cartagena Ipecac has been changed to grayish, grayish brown or reddish brown.

Kino — The rubric paragraph has been changed to read "Kino yields not less than 60 per cent of alcohol soluble extractive." The Bickford-Bennett method is used in assaying this drug.

Limonis Cortex — The botanical variety name in the definition has been changed from *Limonum* (Risso) Hooker filius to "*Limon* Linné." The description has been amplified by adding "membrane crystals" as occurring in some of the parenchyma cells.

Myrrha — The following tests for purity have been added: "Myrrh becomes purplish to violet when treated with nitric acid." "An ethereal solution becomes violet red when treated with bromine vapors."

The Bickford-Bennett method is indicated for alcohol soluble extractive.

Nux Vomica — Under description the thickness has been changed to from 3 to 5 mm.

Podophyllum — The purity requirement has been changed to specify not less than 35 per cent of the resin of podophyllum, and a limit of 3 per cent of foreign organic matter has been added.

The description of the unground drug has been partly rewritten and amplified, the internal characteristics being changed to read, "the bark yellowish to grayish, the wood showing a circle of small yellowish xylem bundles, the pith large and grayish."

Under the structure of the rhizome, the outer portion is found to consist of "one to four layers" of suberized cells.

Under Powdered *Podophyllum* tracheæ "mostly" has been inserted before "with simple pored, etc.," and "cork" has been changed to "suberized."

Prunus Virginiana — In the description of the unground drug the outer surface of both young and older unroasted bark is described, the grayish black color of older bark being added. The structure paragraph has been completely rewritten. Under Powdered Wild Cherry, the color is changed to "light brown to reddish brown." "Calcium oxalate prisms or rosette aggregates numerous" is changed to read "calcium oxalate chiefly in monoclinic prisms but also in rosette aggregates."

The drug is directed to be protected from moisture as well as from light.

Pulvis Glycyrrhizæ Compositus—The description has been augmented by adding "washed sulfur fragments" to the other microscopical elements

Rheum—In the structure portion of the description "vascular bundles with internal sieve and cambium" is changed to compound vascular bundles in the rhizome portions with internal sieve and cambium "

The test for the presence of rhapontic rhubarb has been deleted

Santalum Rubrum—The taste now reads "slightly astringent "

Sarsaparilla—The rubric paragraph has been altered so as to make it mandatory to remove the rhizome and crown portion if in excess of 4 per cent, before the root is ground or powdered

The histological portion of the monograph has been slightly altered by inserting "fibro " before vascular bundles adding pericambium" as a part of the central cylinder and by changing "groups" to strands '

Scilla—The description of the powdered drug has been amplified by adding "fragments of red pink or purple epidermal or parenchyma bulb scale tissue absent (*Red Squill*) "

Senna—The limit on Senna stems is reduced to eight per cent

The paragraph on structure has been amplified to include the histology of the midrib region

Serpentaria—The description of the internal appearance of the unground drug has been changed to read 'internally bark brown, wood yellow and composed of broad eccentric wedges, pith whitish "

Sinapis Nigra—Under Powdered Black Mustard a portion of its seed coat is permitted to be removed to facilitate the powdering

Stramonium—In the description of the powdered drug, "rod like crystals" is changed to "prisms" and 'sphenoidal microcrystals of calcium oxalate' is omitted

Tragacantha—The test for foreign gums has been deleted

Valeriana—Under the description of the structure of the root portion, the thickened radial walls of the endodermal cells and the radial fibro vascular bundle have been introduced

Veratrum Viride—The description of the histology of the root has been amplified to include the large, irregular cavities in the outer region of the cortex

Zingiber—Jamaica Ginger is now the only variety recognized

UNITED STATES PHARMACOPŒIA

ABSTRACT OF PROPOSED CHANGES WITH NEW STANDARDS AND DESCRIPTIONS

ELEVENTH REVISION

Copyright 1935 by the Board of Trustees of the United States Pharmacopœial Convention *
All Rights Reserved

PART VI—ORGANIC CHEMICALS

The Pharmacopœial Convention of 1930 recommended that abstracts of changes proposed for the U S P XI and new standards and descriptions" be published before final adoption that those who are not members of the Revision Committee may have an opportunity for comment and criticism

In compliance with this recommendation the following abstracts are submitted The nomenclature and the exact wording does not necessarily represent that to be finally adopted and doses have not been appended

Comments should be sent to the Chairman of the Revision Committee

E FULLERTON COOK, *Chairman*,
43rd and Woodland Avenue,
Philadelphia, Pa

Acidum Aceticum Dilutum—Contains in each 100 cc not less than 5.7 Gm and not more than 6.3 Gm of $\text{HC}_2\text{H}_3\text{O}_2$ The acid is prepared by mixing 158 cc of Acetic Acid with enough distilled water to make 1000 cc, a change from a gravimetric to a volumetric formula

* Permission to reprint for purposes of comment can be had on application to the Chairman of the Board of Trustees James H. Beal Fort Walton Fla

Acidum Acetylsalicylicum—The melting point is not below 135° C when determined by placing the sample in a bath at 130° C and heating at a rate of 3° per minute

The test for carbonizable substances is standardized in terms of color See Jour A Ph A , 22, 956-961 (1933)

Acidum Citricum—In the colorimetric test for lead, the volume of lead nitrate solution used for comparison is reduced to 2 cc , a reduction of 50 per cent in lead tolerance

Acidum Oleicum—Congealing temperature, not above 10° C Acid value, 188 to 200 Iodine value 85 to 95 The cloud test has been omitted

Acidum Salicylicum—Dissolve 1 Gm in 30 cc of hot distilled water, cool in ice and filter 15 cc of filtrate shows no turbidity (*sulfate*) upon the addition of 2 drops of hydrochloric acid and 5 drops of barium chloride T S

The test for carbonizable substances is standardized as to color

Acidum Stearicum—Defined as a mixture of solid acids obtained from fats, consisting chiefly of palmitic and stearic acids

Congealing temperature, not below 54° C Iodine value, not more than 4 A powdered form of the acid is also recognized

Acidum Tartaricum—In the colorimetric test for lead, the volume of lead nitrate solution used for comparison is reduced to 2 cc , a reduction of 50 per cent in lead tolerance

Acriflavina—A new admission A copy of the monograph may be obtained from the Chairman of the Committee of Revision

Acriflavina Hydrochloridum—A new admission A copy of the monograph may be obtained from the Chairman of the Committee of Revision

Adeps—Solidification point of the fatty acids, 36° to 42° C

Adeps Lanae—The free acids in 10 Gm require not more than 1 cc of tenth normal sodium hydroxide for neutralization

Iodine value, not less than 18 and not more than 36

Ether—This title is reserved for anesthetic ether

A new test for aldehydes is introduced Place 20 cc of Ether in a colorless, glass stoppered cylinder and add 7 cc of a mixture of 1 cc of alkaline mercuric potassium iodide T S with 17 cc of a saturated aqueous solution of sodium chloride Stopper the cylinder and shake it vigorously for ten seconds, then set it aside for one minute the aqueous layer shows no turbidity (*aldehydes and ketones*)

A 1 in 10 solution of potassium iodide replaces cadmium and potassium iodide as the reagent for peroxides

Ethylum—A new admission A copy of the monograph may be obtained from the Chairman of the Committee of Revision

Ethylhydrocupreinae Hydrochloridum—A new admission A copy of the monograph may be obtained from the Chairman of the Committee of Revision

Ethylus Oxidum—This is the title for the newly introduced Solvent Ether It is to be used for all purposes except anesthesia

The test for peroxides is identical with that under *Ether*, with the exception that only one minute is allowed for the reaction

The test for aldehydes is identical with that under *Ether* in U S P X

In all other respects Ethyl Oxide must satisfy the requirements under *Ether*

Alcohol—The litmus paper test has been replaced by a direct titration for acidity 50 cc of alcohol diluted with 50 cc of recently boiled distilled water shall require not more than 0.9 cc of fiftieth normal sodium hydroxide for neutralization, using phenolphthalein as indicator

A new test for *organic impurities aldehydes, etc.*, replaces the silver nitrate test Place 20 cc of Alcohol in a glass stoppered cylinder that has been thoroughly cleaned with hydrochloric acid, then rinsed with distilled water and finally with the Alcohol to be tested Cool the contents to approximately 15° C and add by means of a carefully cleaned pipette, 0.1 cc of tenth-normal potassium permanganate noting the exact time of addition Mix at once by inverting the stoppered cylinder and allow it to stand at 15° C for five minutes the pink color must not entirely disappear

The test for *acetone* is replaced by the following To a mixture of 1 cc each of Alcohol and distilled water add 3 cc of distilled water and 10 cc of mercuric sulfate T S and heat on a bath of

boiling water no precipitate forms within three minutes (*acetone, ketones, isopropyl alcohol and tertiary butyl alcohol*)

The details of the test for *methanol* have been modified to some extent

Aminopyrina (Amidopyrina U S P X)—To 0.1 Gm. of Aminopyrine add 0.1 Gm. of vanillin, 5 cc. of distilled water and 2 cc. of sulfuric acid and heat the mixture to boiling it develops no more color than is obtained by adding 5 cc. of distilled water and 2 cc. of sulfuric acid to 0.1 Gm. of vanillin and heating the mixture to boiling (*antipyrene*)

Amyls Nitris—*Assay* Place about 20 cc. of aldehyde free alcohol in a 100 cc. glass stoppered volumetric flask and weigh accurately. From a pipette add from 3 to 4 cc. of Amyl Nitrite, stopper the flask, again weigh accurately and calculate the weight of the Nitrite taken for assay. Add enough aldehyde-free alcohol to make a volume of 100 cc. at 25° C., stopper the flask and mix thoroughly. Proceed as directed for the *assay of nitrites*, using 10 cc. of the alcoholic solution. One cc. of tenth normal sodium thiosulfate is equivalent to 0.01171 Gm. of $C_6H_{11}NO_2$.

Assay of nitrites—The gasometric assay of organic nitrites has been deleted and replaced by an iodometric assay. An acidified solution of potassium iodide reacts with a nitrite as expressed by the following equation $2KI + 2HCl + 2C_6H_{11}NO_2 = 2KCl + 2C_6H_{11}OH + 2NO + I_2$

The liberation and titration of the iodine must be carried out in an oxygen free atmosphere in order to prevent oxidation by atmospheric oxygen of NO to N_2O_3 with subsequent liberation of additional iodine. It is only necessary to bubble carbon dioxide through the mixture contained in a flask as described below to prevent this oxidation, and the carbon dioxide may be supplied from a cylinder of compressed gas or from any laboratory type of gas generator.

Apparatus Fit a 300 cc. Erlenmeyer flask (or wide mouth bottle) with a 2 hole rubber stopper. Through one hole pass an aeration tube leading to the bottom of the flask and constricted to an internal diameter of about 1 mm. at the lower end. Through the other hole pass a glass tube of at least 6 mm. internal diameter, which will extend about 1 cm. above and below the stopper. Connect the aeration tube with a cylinder or generator of carbon dioxide.

Method Place 10 Gm. of potassium iodide in the flask and add 40 cc. of boiling deaerated distilled water. Insert the stopper in the flask and pass a stream of carbon dioxide through the flask at a rate of five bubbles per second until the solution has cooled to room temperature. Add 10 cc. of dilute hydrochloric acid (1 in 2) and continue the stream of carbon dioxide for at least three minutes. If any iodine is liberated as shown by the appearance of a yellow color, cautiously add tenth normal sodium thiosulfate from a burette, through the outlet tube, until the color is just discharged.

Decrease the flow of carbon dioxide to about 2 bubbles per second and add the directed volume of the nitrite solution to be assayed with a transfer pipette passing the pipette through the outlet tube until the tip is just above the surface of the potassium iodide solution. Touch the tip of the pipette to the outlet tube to remove adhering nitrite solution, then rinse the outlet tube with a fine jet of aldehyde free alcohol from a wash bottle. At once titrate the liberated iodine with tenth-normal sodium thiosulfate introducing the tip of the burette through the outlet tube.

One cc. of tenth normal sodium thiosulfate is equivalent to

Amyl nitrite, $C_6H_{11}NO_2$	0.01171 Gm.
Ethyl nitrite, $C_2H_5NO_2$	0.007505 Gm.
Glyceryl trinitrate, $C_3H_5(NO_3)_3$	0.0113 Gm.

Caution When assaying amyl nitrite, the alcoholic solution of the nitrite must not be used later than thirty minutes after its preparation. If more time has elapsed a fresh solution must be prepared.

Antipyryna—A new test for identity is given. To 0.1 Gm. of Antipyryne add 0.1 Gm. of vanillin, 5 cc. of distilled water and 2 cc. of sulfuric acid and heat the mixture to boiling. It develops an orange-yellow precipitate.

Apomorphina Hydrochloridum—The identity test with sodium bicarbonate has been replaced by the following. To 5 cc. of an aqueous solution of Apomorphine Hydrochloride (1 in 100) add a slight excess of a solution of sodium bicarbonate (1 in 20). A white or greenish white precipitate is formed. Add 3 drops of tincture of iodine and shake the mixture vigorously. An emerald green solution is produced. Add 5 cc. of ether and after vigorous shaking allow the

layers to separate the ether solution is colored deep ruby red, while the aqueous layer retains its green color

Argentum Proteincum Forte (Argento Proteincum Forte U S P X)—The yeast test is replaced by the following Dissolve 1 Gm of Strong Protein Silver in 10 cc of distilled water Add, all at once, 7 Gm of reagent ammonium sulfate and stir until coagulation takes place Filter and to the clear filtrate add 3 drops of hydrochloric acid a white precipitate is formed (distinction from mild protein silver)

Argentum Proteincum Mile (Argento-Proteincum Mile U S P X)—The yeast test is replaced by the following Dissolve 1 Gm of Mild Protein Silver in 10 cc of distilled water Add, all at once, 7 Gm of reagent ammonium sulfate and stir until coagulation takes place Filter, and to the filtrate add 3 drops of hydrochloric acid no precipitate is formed (distinction from strong protein silver)

Arsphenamine—The following tests for purity have been introduced Dilute 10 cc of Arsphenamine solution (1 in 100) in a small flask or beaker with 50 cc of distilled water Add 5 drops of phenolphthalein T S and titrate with tenth-normal sodium hydroxide, watching the supernatant liquid for the end point not less than 3.9 cc and not more than 4.2 cc of tenth normal sodium hydroxide will be required

Add 0.6 Gm of Arsphenamine to 20 cc of distilled water in a small flask or cylinder and agitate gently a complete solution results within fifteen minutes

Expose the ampuled product to a temperature of 56° C for a period of forty eight hours it shows no marked change in color, consistency or solubility

The following caution is appended The solution must be alkalinized with 0.85 cc of normal sodium hydroxide for each 0.1 Gm of Arsphenamine prior to injection

Atropina and Atropina Sulfas—The carbonization test with sulfuric acid is standardized in terms of color

Balsamum Tolutanum (Tolu U S P X)—The test for rosin is modified Shake about 2 Gm of Tolu Balsam with 20 cc of carbon disulfide allow it to stand for thirty minutes, filter the liquid and evaporate the filtrate to dryness Triturate the residue with 10 cc of petroleum benzine and filter the solution into a dry test-tube Add 5 cc of a sulfuric acid solution (made by mixing equal volumes of sulfuric acid and distilled water and cooling the mixture), shake vigorously, allow the mixture to settle and add acetic anhydride drop by drop no red, violet or purple band is formed (rosin, rosin oil or copaiba)

Barbitalum—The identity test with mercuric nitrate T S is changed slightly, as follows A saturated aqueous solution of Barbital yields with mercuric nitrate T S a white precipitate which is soluble in ammonia T S

The carbonization test with sulfuric acid is standardized in terms of color

Barbitalum Solubile—The carbonization test with sulfuric acid is standardized in terms of color

Benzinum Purificatum—It is directed to determine the residue upon evaporation at 40° C in a glass or porcelain dish

Betanaphthol—The volume of ammonia T S used in the solubility test is increased from 25 cc to 30 cc

Caffeine—The temperature for the drying of Caffeine is changed from 100° C to 80° C

The carbonization test with sulfuric acid is standardized in terms of color

Caffeina Citrata—The temperature for the drying of Citrated Caffeine, and the caffeine residue therefrom, is changed from 100° C to 80° C

Slight changes are made in the assay for caffeine The volume of sodium hydroxide T S is reduced to 8 cc and the caffeine is extracted with three or more 20 cc portions of chloroform

Caffeina cum Sodii Benzoate (Caffeina Sodii-Benzoas U S P X)—The temperature for the drying of Caffeine with Sodium Benzoate, and the caffeine residue therefrom is changed from 100° C to 80° C

The carbonization test with sulfuric acid is standardized in terms of color

Colcin Iodobehenas—The tests for identity have been amended by deleting the test for iodine with sulfuric acid and chloroform, and by introducing a test for calcium in the ash

Camphora—Synthetic Camphor is recognized as well as the natural product

The specific rotation $[\alpha]_D^{25}$ of synthetic camphor is between +5° and -5°

Mix 0.1 Gm of finely divided Camphor with 0.2 Gm of sodium peroxide in a clean, dry hard glass test tube of about 25 mm internal diameter and 20 cm in length. Suspend the tube at an angle of about 45° by means of a clamp placed at the upper end, and gently heat the tube, starting at the upper end and gradually bringing the heat toward the lower part of the tube until incineration is complete. Dissolve the residue in 25 cc of warm distilled water, acidify with nitric acid and filter the solution into a comparison tube. Wash the test-tube and filter with two portions of 10 cc each of hot distilled water, adding the washings to the filtered solution. Add to the filtrate 0.5 cc of tenth normal silver nitrate, dilute with distilled water to 50 cc and mix thoroughly. The turbidity is no greater than that produced in a control test with the same quantities of the same reagents and 0.05 cc of fiftieth normal hydrochloric acid (*halogens*).

Carbo Activatus —(*Replacing Carbo Ligni U S P X*) —A copy of the monograph may be obtained from the Chairman of the Committee of Revision. See also *Jour. A. Ph. A.* 24, 630 (1935).

Carbones Tetrachloridum —The carbonization test with sulfuric acid is standardized in terms of color. In the test for the presence of carbon disulfide, dehydrated alcohol is replaced by alcohol.

Carbomalum —The carbonization test with sulfuric acid is standardized in terms of color.

Cera Alba and Cera Flava —A test for carnauba wax has been added. Place 0.1 Gm of Yellow (White) Wax in a test tube and add 20 cc of *n*-butanol. Immerse the test-tube in boiling water and shake the mixture gently until solution is complete. Immerse the test-tube in a beaker of water at 60° C and allow it to cool to room temperature during a period of two hours. A loose mass of fine, needle-like crystals separates from a clear mother-liquor. Under the microscope the crystals are loose needles or stellate clusters, without the presence of amorphous masses (*carnauba wax*).

Chloralis Hydras —The carbonization test with sulfuric acid is standardized in terms of color.

Chloramina-T (Chloramina U S P X) —The carbonization test with sulfuric acid is standardized in terms of color.

Chlorobutanol —A new admission. A copy of the monograph may be obtained from the Chairman of the Committee of Revision.

Chloroformum —The specific gravity 1.474 to 1.478 at 25° C is transferred to the 'Tests for purity' since it is a very accurate indication of the alcohol content of the Chloroform.

The test for *substances decomposable by sulfuric acid* is standardized in terms of color.

Two new tests are added. Agitate 3 cc of Chloroform with 10 cc of ammonia-free distilled water in a glass stoppered cylinder for five minutes. After the liquids separate transfer 5 cc of the water extract to another glass stoppered cylinder containing 40 cc of ammonia-free distilled water, and add 5 cc of alkaline mercuric potassium iodide T.S. No turbidity or precipitate will develop within one minute (*aldehydes and ketones*).

Into each of two 50-cc glass stoppered cylinders of colorless glass, having an internal diameter of 20 mm, place 10 cc of distilled water, two drops of phenolphthalein T.S. and enough hundredth normal sodium hydroxide to produce, after vigorous shaking, pink tints of equal intensity. Into one of the cylinders measure exactly 20 cc of chloroform and again shake the mixture well. Add hundredth normal sodium hydroxide, drop by drop, from a burette, shaking the mixture well after each addition, until the pink color is reproduced in an intensity equal to that in the cylinder without the chloroform. Not more than 0.20 cc of hundredth normal sodium hydroxide is required to produce a pink color, which is permanent for fifteen minutes (*acids and phosgene*).

Cocaina and Cocainæ Hydrochloridum —The carbonization test with sulfuric acid is standardized in terms of color.

Codena —The carbonization test with sulfuric acid is standardized in terms of color.

Codina Phosphas —Codeine Phosphate must now contain not less than 70 per cent of anhydrous codeine, an increase of 3 per cent, and the water of hydration shown in the chemical formula is reduced to 1½ molecules.

Copaiba —The lower limit of non-volatile resin is reduced to 27 per cent.

Creosolum —Creosote begins to distill at about 203° C and not less than 90 per cent of it by volume distills between 203° and 220° C when determined by Method II under *Boiling and Distilling Points*. This is an increase of 3° in the minimum boiling point.

Dextrosom — Dextrose loses not less than 8 per cent and not more than 10 per cent of its weight when dried to constant weight at 105° C. This fixes a minimum as well as a maximum moisture content.

Dichloramina T (Dichloramina U S P X) — The carbonization test with sulfuric acid has been deleted.

Emetinae Hydrochloridum — The water content has been changed from a maximum of 19 per cent to not less than 8 per cent and not more than 16 per cent.

The carbonization test with sulfuric acid is standardized in terms of color.

Ephedrina — A new admission. A copy of the monograph may be obtained from the Chairman of the Committee of Revision.

Ephedrina Hydrochloridum — A new admission. A copy of the monograph may be obtained from the Chairman of the Committee of Revision.

Ephedrina Sulfas — A new admission. A copy of the monograph may be obtained from the Chairman of the Committee of Revision.

Epinephrina — A new test for purity is added. Dissolve 1 Gm. of Epinephrine, dried to constant weight over sulfuric acid, in 15 cc. of half-normal hydrochloric acid; the solution is clear. Add to this solution sufficient half-normal hydrochloric acid to make a volume of 20 cc. at 25° C. The specific rotation $[\alpha]_D^{25}$ of this solution at 25° C., and using a 200 mm. tube, with sodium light, is not less than -50° and not more than -53.5° .

Erythrylis Tetrantras Dilutus — A new admission. A copy of the monograph may be obtained from the Chairman of the Committee of Revision.

Fluoresceinum Solubile — A new admission. A copy of the monograph may be obtained from the Chairman of the Committee of Revision.

Gelatinum — In the place of the statement that a solution of Gelatin forms a firm, transparent or translucent jelly on standing for several hours at 6° C., there is introduced a new test for jelly strength. Place 0.1 Gm. of Gelatin, accurately weighed in a test-tube about 150 mm. in length and having an internal diameter of 15 mm. and add enough distilled water to make the mixture measure exactly 10 cc. at 25° C. Place a stirring rod in the tube and allow it to stand, with occasional stirring, for six hours. Place the tube in a bath of boiling water and stir until the Gelatin is completely dissolved and the solution thoroughly mixed. At once remove the stirring rod, stopper the tube tightly and allow it to stand in a refrigerator over night. Place the tube in a bath of ice water for thirty minutes, then allow the temperature of the bath to rise slowly. When the temperature of the bath reaches 10° C. the jelly does not flow when the test-tube is laid on its side.

The test for arsenic has been modified. Heat 15 Gm. of Gelatin with 60 cc. of dilute, arsenic-free hydrochloric acid (1 in 4) in a covered flask until all insoluble matter is flocculated and the Gelatin dissolved. Add an excess of bromine T.S. (about 15 cc.) neutralize with ammonia T.S., add 1.5 Gm. of sodium phosphate and allow to cool. Add a slight excess (about 30 cc.) of magnesia mixture T.S., allow to stand for one hour, filter and wash with 5-10 cc. portions of ammonia T.S., diluted with 3 volumes of water. Drain the precipitate well and dissolve it in dilute arsenic-free hydrochloric acid (1 in 4) to a volume of exactly 50 cc. Subject 5 cc. of this solution to the test for arsenic. The stain, if any, is not more intense than that produced in a test made with similar quantities of the same reagents and 1.5 cc. of the standard arsenic test solution.

Glycerinum — The carbonization test with sulfuric acid is standardized in terms of color.

Gossypium Purificatum — The test for fatty matter has been amended by prescribing extraction in a Soxhlet apparatus. The limit of fatty matter is unchanged, but it is directed that the ethereal solution may have no blue, green or brownish color.

Histaminæ Phosphas — A new admission. A copy of the monograph may be obtained from the Chairman of the Committee of Revision.

Hydargyri Succinimidum — A new admission. A copy of the monograph may be obtained from the Chairman of the Committee of Revision.

Iodophthalenum — A new admission. A copy of the monograph may be obtained from the Chairman of the Committee of Revision.

Lactosum — No changes have been made over those announced for the interim revision official January 1, 1934, except that it is directed to add 0.2 cc. of ammonia T.S. to the solution used for determination of the specific rotation.

Linimentum Camphoræ—The assay for camphor is conducted by volatilizing the camphor in a current of carbon dioxide

Linimentum Chloroformi—An assay has been introduced for this liniment and for *Spiritus Chloroformi*. For details see *JOUR A PH A*, 22 540-544 (1933). 100 cc of the Liniment contains, in each 100 cc, not less than 40 Gm and not more than 45 Gm of CHCl_3 .

Liquor Cresolis Saponatus (Liquor Cresolis Compositus U S P X)—The assay has been amended by substituting a saturated solution of calcium chloride for the solution of sodium chloride previously used for washing the recovered cresol. The cresol is then dried over anhydrous calcium chloride (No. 4 mesh) instead of ignited potassium carbonate.

Liquor Epinephrini Hydrochloridi—The use of an approved preservative is authorized.

Liquor Ergosterolis Irradiati—A new admission. A copy of the monograph may be obtained from the Chairman of the Committee of Revision.

Liquor Formaldehydi—Bromthymol blue T S is introduced as the indicator for the determination of acidity and in the assay.

Liquor Histaminæ Phosphatis—A new admission. A copy of the monograph may be obtained from the Chairman of the Committee of Revision.

Liquor Parathyroides—A new admission. A copy of the monograph may be obtained from the Chairman of the Committee of Revision.

Liquor Pituitarii Posterioris (Liquor Pituitarii U S P X)—An approved preservative may be added.

Mel—The method for the determination of ash has been modified. Weigh accurately about 10 Gm of Honey into a platinum dish, add a few drops of olive oil to prevent spattering heat carefully until swelling ceases and ignite not above dull redness until a white ash is obtained not more than 0.3 per cent of ash remains.

Merbaphenum—A new admission. A copy of the monograph may be obtained from the Chairman of the Committee of Revision.

Methylthioninæ Chloridum—Methylthionine Chloride contains, when dried to constant weight at 110°C , not less than 98.5 per cent of $\text{C}_{16}\text{H}_{18}\text{N}_3\text{ClS}$.

The test for zinc is modified to detect copper as well. Heat 0.5 Gm of Methylthionine Chloride at a temperature below a red heat until it is completely carbonized, boil the powdered residue with 10 cc of diluted nitric acid for five minutes, filter and wash the residue with 10 cc of distilled water. Boil the combined filtrate and washings with 1 cc of nitric acid, add an excess of ammonia T S and filter if necessary. The liquid remains clear upon the addition of an equal volume of hydrogen sulfide T S (copper or zinc).

Assay. Place about 0.2 Gm of Methylthionine Chloride dried to constant weight at 110°C and accurately weighed in a 500 cc volumetric flask and dissolve it in 100 cc of distilled water. Add 50 cc of sodium acetate solution (1 in 10) and mix thoroughly then add from a burette 50 cc of tenth normal iodine keeping the mixture in constant rotation. Stopper the flask and allow the mixture to stand for fifty minutes shaking it vigorously at intervals of ten minutes. Add distilled water to make the mixture measure 500 cc mix thoroughly, allow to stand for ten minutes and filter through a filter that has not been previously moistened. Reject the first 30 cc of filtrate. Determine the excess of iodine by titration of 100 cc of the subsequent filtrate with tenth-normal sodium thiosulfate. Each cc of tenth-normal iodine is equivalent to 0.005328 Gm of $\text{C}_{16}\text{H}_{18}\text{N}_3\text{ClS}$.

Neosarsphenamina—The rubric is amended by requiring not less than 19 per cent and not more than 22 per cent of As.

Some modifications of the tests for identity are introduced.

A new test for purity is added. Expose the ampuled product to a temperature of 56°C for forty eight hours. It should show no marked change in color, consistency or solubility.

Neocinchophenum—A new admission replacing Cinchophenum. A copy of the monograph may be obtained from the Chairman of the Committee of Revision.

Oleum Amygdalæ Expressum—In the test for various foreign oils, it is now directed to cool the liberated fatty acids to 15°C and allow to stand for thirty minutes without stirring.

The solidification point of the fatty acids is fixed at not less than 9° and not more than 12°C .

Oleum Chaulmoogra—The definition is changed to read. The fixed oil expressed from the ripe seeds of *Taraktogenos Kurzii* King, *Hydnocarpus Wightiana* Blume or *Hydnocarpus an*

thelmintica Pierre (Fam *Flacourtiaceæ*) The fixed oil expressed from the ripe seeds of other species of *Hydnocarpus* (Fam *Flacourtiaceæ*) when designated as such and when conforming with the description, physical properties and tests for identity and purity prescribed below, may be used

The minimum free acidity has been deleted, and the maximum reduced to 40 cc of tenth-normal alkali for 10 Gm of oil

A new test for purity has been added Place 25 cc of Chaulmoogra Oil in a measuring tube consisting of a glass stoppered, pear shaped bulb of not less than 100 cc capacity, joined at its lower, tapering end to a tube about 30 cm long, graduated to 25 cc in divisions of 0.1 cc Add 100 cc of neutralized alcohol and shake the mixture thoroughly for not less than ten minutes Allow the tube to stand for twenty-four hours and observe the volume of the lower layer Its volume is not less than 23.5 cc (*free fatty acids or castor oil*)

The lower limit of iodine value has been reduced from 98 to 93

Oleum Gossypii Seminis —The solidification point of the fatty acids has been fixed as not less than 28° and not more than 35° C

Oleum Iodatum (*Iodized Oil*) —A new admission A copy of the monograph may be obtained from the Chairman of the Committee of Revision

Oleum Lini —The color test for rosin or rosin oil has been corrected Warm 10 cc of Lin seed Oil with an equal volume of acetic anhydride in a test-tube until solution is effected allow the mixture to cool, then separate the lower anhydride layer and filter it through a small filter moistened with acetic anhydride Place 2 or 3 drops of the filtrate on a white porcelain surface and add 1 drop of sulfuric acid a violet color is not produced in the mixture

Oleum Maydis (*Corn Oil*) —A new admission A copy of the monograph may be obtained from the Chairman of the Committee of Revision

Oleum Morrhue and *Oleum Morrhue Non Destearinatum* —The corrected monographs for these have already appeared as interim revisions of U S P X

Oleum Olivæ —The free fatty acids in 10 Gm of oil require for neutralization not more than 5 cc of tenth normal alkali

In the test for peanut oil the volume of 90 per cent alcohol used to dissolve the dry fatty acids is increased from 50 cc to 60 cc

The range of iodine value is changed from 79 to 88

The solidification point of the fatty acids is from 17° to 26° C

Oleum Theobromatis —The specific gravity is changed to from 0.858 to 0.864 at $\frac{100^{\circ}}{25^{\circ}}$ C

The range of iodine value becomes 35 to 40

The solidification point of the fatty acids is from 45° to 50° C

Pancreatinum —The assay for starch digestive power has been modified Determine the percentage of moisture in potato starch by drying about 0.5 Gm, accurately weighed, at 120° C for four hours Thoroughly mix a quantity of the starch equivalent to 3.75 Gm of dry starch with 10 cc of cold distilled water Add the mixture with constant stirring to 75 cc of distilled water, previously heated to from 50° to 60° C, contained in a tared 250-cc beaker Rinse the remaining starch into the beaker with 10 cc of distilled water, heat the mixture to boiling and boil it gently with constant stirring for five minutes, or until a translucent, uniform paste is obtained Add enough distilled water to make the mixture weigh 100 Gm, cool the paste to 40° C and place the beaker in a water bath maintained at 40° C Suspend 0.15 Gm of Pancreatin in 5 cc of distilled water and add the suspension to the starch paste, mixing it well by pouring the mixture from beaker to beaker for thirty seconds, noting the time when the Pancreatin suspension was added to the starch Maintain the mixture at a temperature of 40° C for exactly five minutes At once add 0.1 cc of this mixture to a previously made mixture of 0.2 cc of tenth-normal iodine and 60 cc of distilled water at a temperature of from 23° to 25° C, no blue, red or violet color is produced

Paraffinum —In place of the test with cold sulfuric or nitric acid, a carbonization test with sulfuric acid is introduced Pour 5 cc of Paraffin, at a temperature just above its melting point, and 5 cc of sulfuric acid, into a glass stoppered cylinder, which has been previously rinsed with sulfuric acid and heat in a water-bath at 60° C for ten minutes, shaking the mixture at intervals of one minute the paraffin remains unchanged in color, and the acid does not become darker than pale amber

Paraldehydum —The congealing point has been raised to not less than 11° C

In place of the potassium hydroxide test for aldehyde there has been substituted the following Place 100 cc of distilled water in a 300 cc Erlenmeyer flask, add 5 cc of Paraldehyde and shake the mixture gently until solution is complete Add 5 cc of a solution of hydroxylamine hydrochloride (made by dissolving exactly 3.5 Gm of hydroxylamine hydrochloride in enough distilled water to make 100 cc of solution) Shake the mixture gently for thirty seconds, add 2 drops of methyl orange T S and titrate immediately with half-normal sodium hydroxide Perform a blank determination with 5 cc of the hydroxylamine hydrochloride solution added to 100 cc of distilled water, the difference between the two titrations does not exceed 1 cc of half normal sodium hydroxide (*acetaldehyde*)

Pepsinum —Pepsin digests not less than 3000 and not more than 3500 times its weight of egg albumen

Assay Mix 35 cc of normal hydrochloric acid with 385 cc of distilled water Dissolve 0.1 Gm of Pepsin in 150 cc of this acid Likewise dissolve 0.1 Gm of Reference Pepsin in another portion of 150 cc of this dilute acid Immerse one or more hen's eggs in boiling water during fifteen minutes Cool them rapidly to room temperature by immersion in cold water, remove the shell and pellicle and all of the yolk and at once rub the albumen through a clean dry, No. 40 sieve rejecting the first portion that passes through the sieve Place 10 Gm of the succeeding well mixed portion in each of three wide mouth bottles of about 100 cc capacity Immediately add 35 cc of the dilute acid at one time or in portions and, by suitable means, disintegrate thoroughly the particles of albumen Place the bottles in a water-bath at 52° C After the contents of the bottles have reached that temperature add exactly 5 cc of the acidulated solution of Pepsin to one bottle 4.30 cc of the same solution and 0.70 cc of the dilute acid to another bottle and exactly 5 cc of the acidulated solution of Reference Pepsin to the third bottle At once stopper the bottles securely, invert them three times and maintain them at a temperature of 52° C for two and one half hours agitating the contents equally every ten minutes by inverting the bottles once Remove the bottles from the bath pour the contents into 100-cc conically shaped measuring vessels, having diameters not exceeding 1 cm at the bottom, and graduated from the tip to the 10 cc mark in 0.05 cc divisions and from the 10 cc to the 50 cc mark in 0.1 cc divisions, and having the internal taper as nearly identical as possible Transfer the undigested egg albumen which adheres to the sides of the bottles to the respective measuring vessels with the aid of small portions of distilled water until 50 cc has been used for each Mix the contents of each measuring vessel and allow them to stand for thirty minutes The volume of the undissolved albumen in the measuring vessel corresponding to the 50 cc of the solution of Pepsin being assayed shall not be more than the volume of the undissolved albumen in the measuring vessel corresponding to the 50 cc of the Reference Pepsin solution, and the volume of the undissolved albumen in the measuring vessel corresponding to 4.30 cc of the solution of Pepsin being assayed shall not be less than the volume of the undissolved albumen in the measuring vessel corresponding to the 50 cc of the Reference Pepsin solution

Reference Pepsin may be obtained from the Chairman of the Committee of Revision

Petrolatum —The carbonization test with sulfuric acid has been standardized The concentration of acid used must be between 94.5 and 95.5 per cent of H₂SO₄ determined by titration See JOUR. A. PH. A. 22:956-961 (1933)

Phenacaine —A new admission A copy of the monograph may be obtained from the Chairman of the Committee of Revision

Phenobarbitalum —The tests for identity have been modified

The carbonization test with sulfuric acid has been standardized in terms of color

Phenobarbitalum Solubile —A new admission A copy of the monograph may be obtained from the Chairman of the Committee of Revision

Phenolphthaleinum —The melting point is fixed at not below 258° C an increase of 2°

Physostigma Salicylas —The carbonization test with sulfuric acid is standardized in terms of color

Pilocarpina Nitras —The carbonization test with sulfuric acid is standardized in terms of color

Procaine Hydrochloridum —The carbonization test with sulfuric acid is standardized in terms of color

Pulvis Chinofoni—A new admission A copy of the monograph may be obtained from the Chairman of the Committee of Revision

Quinidinae Sulfas—The carbonization test with sulfuric acid has been standardized in terms of color

Quinina—The carbonization test with sulfuric acid has been standardized

Quinnæ Bisulfas—The carbonization test with sulfuric acid has been standardized

Quinnæ Dihydrochloridum—The carbonization test with sulfuric acid has been standardized

Quinnæ et Ureae Hydrochloridum—The carbonization test with sulfuric acid has been standardized

Quinnæ Sulfas—The dihydrate replaces the heptahydrate as the official form The official solubility figures are changed as a result

The loss in weight on drying at 100° C must not exceed 5 per cent

The carbonization test with sulfuric acid is standardized

Resina—The definition has been changed to read Rosin is a solid resin obtained from *Pinus palustris* Miller, and from other species of *Pinus* (Fam *Pinaceæ*) This will admit rosin produced by the so called steam-solvent process, if it complies in other respects with the monograph

Saccharinum (*Glusidum U S P X*)—The carbonization test with sulfuric acid has been standardized

Santoninum—The carbonization test with sulfuric acid has been standardized

Sapo Durus (*Sapo U S P X*)—The definition has been altered to read simply "Soda Soap" The monograph has been so amended as to apply only to soaps that have the chemical and physical characteristics of a soap produced by the saponification of olive oil with sodium hydroxide It is well known that soaps having these characteristics may be produced from other than olive oil, and that there are no chemical tests that will satisfactorily distinguish such soaps from an olive oil soap It has therefore seemed the part of wisdom for the Pharmacopœia to recognize such a condition and provide a workable rather than a useless definition

The caustic alkalinity or free acidity in 2.5 Gm of the soap, determined in the alcoholic extract, requires for neutralization not more than 0.2 cc of tenth normal acid or alkali, using phenolphthalein T S as the indicator The carbonate alkalinity, determined in the alcohol-insoluble residue requires not more than 2 cc of tenth normal acid for neutralization using methyl orange T S as the indicator

When the fatty acids are separated from the soap solution by acidifying, washing and drying, their solidifying point is not less than 18° and not more than 23° C, their acid value is not less than 185 and not more than 205 and their iodine value is not less than 83 and not more than 92

Sapo Mollis—The soap may be made with potassium hydroxide exclusively, if desired

Soft soap must contain not more than 0.25 per cent of caustic alkali calculated as potassium hydroxide, when determined by titration of the alcoholic extract from 5 Gm of Soap with tenth normal sulfuric acid using phenolphthalein T S as the indicator

The alcohol insoluble residue from the same sample will require, for neutralization, when dissolved in water, not more than 2.5 cc of tenth normal sulfuric acid, using methyl orange T S as the indicator (*carbonate alkalinity*)

The acid value of the liberated fatty acids is not less than 190 and not more than 205, and the iodine value is not less than 170

Sodii Cacodylas—The permissible free acidity in 2 Gm has been reduced to an equivalent of 0.5 cc of tenth normal sodium hydroxide

Spiritus Ethylis Nitritus—This is assayed iodometrically, as already described The assay is performed upon 10 cc of the Spirit, which is not previously shaken with powdered potassium bicarbonate and the weight of sample taken is calculated from its specific gravity at 25° C Each cc of tenth normal sodium thiosulfate is equivalent to 0.007505 Gm of C_2H_5NO

Spiritus Camphoræ—Because of the admission of synthetic camphor, which is optically inactive it has been necessary to introduce a chemical assay Accurately measure 25 cc of Spirit of Camphor into a 300-cc Erlenmeyer flask, and add slowly, with constant shaking, 75 cc of dinitrophenylhydrazine T S (a solution of 1.5 Gm of dinitrophenylhydrazine in 100 cc of 1 in 10

sulfuric acid) Connect the flask with a reflux condenser and heat on a water bath for four hours Allow the mixture to cool, add 200 cc of dilute sulfuric acid (1 in 50), and set the mixture aside for twenty-four hours Transfer the precipitate to a previously dried and weighed Gooch crucible and wash with 10 cc portions of cold distilled water until the last washing is not acid to litmus paper Continue the suction until the excess water is removed, and dry the crucible and precipitate to constant weight at 80° C The weight of the precipitate, multiplied by 0.458, equals the weight of camphor in 25 cc of the Spirit of Camphor taken for the assay

Spiritus Chloroformi—An assay has been introduced For details see JOUR A PH A, 22 540-544 (1933)

Spiritus Frumenti—The limit of acidity has been changed A 25 cc portion should require not less than 2 cc and not more than 6 cc of tenth normal sodium hydroxide for neutralization

The limit for esters using the method of U S P X, is now not less than 2 cc nor more than 8 cc of tenth normal sodium hydroxide

Mercuric sulfate T S is now used as the reagent for acetone, replacing sodium nitroprusside as described under Alcohol

Slight modifications have been made in the details of the other tests for impurities

Spiritus Glycerylis Nitratis—A new assay is given Transfer 25 cc of Spirit of Glycerol Trinitrate to a previously weighed, 50 cc volumetric flask, stopper the flask and weigh accurately Add 3 cc of an aqueous solution of sodium hydroxide (1 in 5), re stopper the flask and allow it to stand at room temperature for one hour Then add sufficient aldehyde free alcohol to make the total volume measure 50 cc, stopper and mix thoroughly Assay 20 cc of this solution according to the method for the assay of nitrites One cc of tenth normal sodium thiosulfate is equivalent to 0.0113 Gm of glyceryl trinitrate

Spiritus Vini Vitis—Tests for purity are based upon those found under Spiritus Frumenti

Strychnina Nitratis—The carbonization test with sulfuric acid has been standardized

Strychnina Sulfas—Strychnine Sulfate loses not more than 11.5 per cent of its weight upon drying at 100° C

The carbonization test with sulfuric acid has been standardized

Styrax—A test for rosin and rosin oil is introduced Triturate about 2 Gm of Storax with 25 cc of petroleum benzene in a small beaker for five minutes Filter the mixture, and place 10 cc of the filtrate in a dry test-tube Add 5 cc of dilute sulfuric acid (made by mixing equal volumes of sulfuric acid and distilled water and cooling the mixture) shake it vigorously, and allow the mixture to settle Add acetic anhydride, drop by drop the mixture exhibits no violet or purple band

Tabella Glycerylis Trinitratis—A new admission A copy of the monograph may be obtained from the Chairman of the Committee of Revision

Theophyllina—The carbonization test with sulfuric acid has been standardized

Theophyllina cum Aethylenediamina—A new admission A copy of the monograph may be obtained from the Chairman of the Committee of Revision

Theophyllina cum Sodii Acetate—A new admission A copy of the monograph may be obtained from the Chairman of the Committee of Revision

Thyroideum—A detailed description of the appearance of the powder under the microscope has been added

Thyroid contains not more than 6 per cent of moisture determined by the toluene distillation method

The limit of ash has been removed to permit the use of sodium chloride as a preservative

The assay directions have been elaborated see JOUR A PH A 24 742-748 (1935)

Tryparsanum—A new admission A copy of the monograph may be obtained from the Chairman of the Committee of Revision

If trade be a calling in which material goods are sold and a profession one in which knowledge is sold—and this seems to be one essential difference between them—then I am sure that the professional side of pharmacy is fated greatly to increase in this country (Great Britain)

—SIR FREDERICK GOWLAND HOPKINS

HOUSE OF DELEGATES, AMERICAN PHARMACEUTICAL ASSOCIATION

ABSTRACTS OF THE MINUTES OF THE SESSIONS HELD IN MULTNOMAH HOTEL, PORTLAND, ORE., AUGUST 5-10, 1935

The First Session of the House of Delegates was convened by Chairman Rowland Jones, Jr., at 1 30 P M., Tuesday, August 6, 1935, he welcomed the delegates present. The roll call showed that a quorum was present and the House of Delegates was declared organized for business.

The names of delegates and organizations represented follow. The name of the organization or state is in Italics; names of delegates in capitals and small capitals and the names of voting delegates in bold face.

The minutes of the House of Delegates are printed here and to avoid duplication in printing will also answer for the reports of the transactions made to the General Sessions—the reports are abstracts of the minutes.

The names of the delegates follow.

Philadelphia College of Pharmacy and Science—E F Cook, F P STROUP

In the absence of Vice Chairman Williams, former Chairman P H Costello was requested to take the chair while Chairman Jones read his address, which was under the by-laws referred to the Committee on Resolutions See pages 708-715, August JOURNAL A PH A Chairman Jones announced the appointment of the following Committees

Committee on Resolutions *Chairman*, R L Swain, Maryland, E R Series, South Dakota, George C Schicks, New Jersey, F E Bibbins, Indiana, Roy B Cook, West Virginia, L L Walton, Pennsylvania, M N Ford, Ohio, A L I Winne Virginia, Walter D Adams, Texas

Committee on Nominations *Chairman*, R C Wilson, Georgia, Frank Nau, Oregon, Herbert Parker, Arkansas, John C Krantz, Jr, Maryland, H C Christensen, Illinois, Arthur D Baker, Colorado, Hugo Schaefer, New York, Frank Mortensen, California, W H Hankins, Florida

Chairman R C Wilson stated that the Committee on Nominations would be glad to have suggestions from any of the members in regard to nominees and will be glad to have them come before the Committee at its first meeting at 3 00 P M, on Wednesday, in the Empire Room of the Multnomah Hotel

Chairman Jones announced as the next order of business the reading of the annual report of the Council by Secretary E F Kelly

ANNUAL REPORT OF THE COUNCIL TO THE HOUSE OF DELEGATES 1934-1935

The Council membership consisted of nine elected members, J H Beal, C E Caspari, C H LaWall H V Army H C Christensen, W D Adams, H A B Dunning, S L Hilton and W Bruce Philip and eight ex officio members, President Fischelis, Vice-Presidents Geo D Beal and Oscar Rennebohm, Secretary Kelly, Treasurer Holton, Editor Eberle, Editor DuMez and Chairman of the House of Delegates, Rowland Jones, Jr

The Council has supervision of the property, funds and publications of the ASSOCIATION and acts for the ASSOCIATION and the House of Delegates in the interim between meetings

The business presented to the Council during the year was unusual in scope and importance It was transacted at a meeting of the Council in Washington at two meetings of its Executive Committee on July 17th and January 5th, and the actions of which were confirmed by the Council and at a meeting of the Council in Portland which began on Saturday, August 3rd, and by mail Twenty one Council Letters covering 68 pages and submitting 110 items of business and 39 motions were sent to the members of the Council All of these Letters have been published in the JOURNAL

The Council organized at a meeting on Friday May 11, 1934 in the Shoreham Hotel Washington, D C, following the last General Session of the ASSOCIATION and elected S L Hilton, *Chairman*, J H Beal *Vice Chairman*, and E F Kelly, *Secretary* E G Eberle was elected *Editor* of the JOURNAL and A G DuMez *Editor* of the YEAR BOOK

Chairman Hilton appointed the Council Committees on Finance, on Property and Funds, on Publications on Standard Program and on the YEAR BOOK, and was authorized to appoint an Executive Committee of the Council should the occasion arise

The Council elected S C Henry a member of the Commission on Proprietary Medicines and W J Husa and Geo D Beal members of the Committee on Pharmaceutical Research for terms of five years in each case

As the president was not prepared to submit his appointments he was authorized to make such appointments as are now provided for, to fill vacancies as they may occur, and to make additional appointments as may be necessary or advisable during the year

As the balance in the Headquarters Building Fund was not sufficient to meet all expenses for the building, landscaping approach furniture and equipment the proper officers of the ASSOCIATION were authorized to borrow \$40 000 00 from the Maryland Trust Company at 4% interest and with Chairman Dunning's endorsement and the loan was paid in full on December 31, 1934, through additional collections

The first meeting of the Executive Committee was held in the AMERICAN INSTITUTE OF PHARMACY on July 17th, with the full membership present—Fischelis, Hilton, Army, Dunning, DuMez Eberle, Holton, Kelly, LaWall and Philip

It was decided that all papers presented before the Sections be submitted in duplicate and the request of the Section on Practical Pharmacy and Dispensing that fifty dollars be added to its budget for use in collecting and correlating propaganda which has been employed to promote professional pharmacy, was approved

As the Reading Room of the AMERICAN INSTITUTE OF PHARMACY had been equipped in honor of the late Franklin M Apple to the extent of the funds bequeathed by him, it was ordered that the Apple Fund, amounting to \$1607 05, be transferred to the Headquarters Building Fund

Chairman Dunning submitted, in detail, the plans for securing a maintenance fund and for possible additions to the building and to its equipment The subject was discussed at length during which details of the future plans of the ASSOCIATION in connection with the AMERICAN INSTITUTE OF PHARMACY were given careful consideration Each member of the Council was requested to submit in written form his ideas for the activities to be undertaken in the INSTITUTE in addition to those already announced

The following subjects were also considered

"Proposed merger of the AMERICAN PHARMACEUTICAL ASSOCIATION and National Association of Retail Druggists as advocated by a number of state pharmaceutical associations, proposed federation of state associations and possible affiliation of such federation with the national associations, proposed consolidation of dues of national and state associations, possibility of organizing certain surveys and other activities in the AMERICAN INSTITUTE OF PHARMACY if funds are provided from outside sources, status of the AMERICAN INSTITUTE OF PHARMACY in relation to the AMERICAN PHARMACEUTICAL ASSOCIATION, proposed plan for a Council of Pharmaceutical Practice as advocated by Professor Cook, study of state codes, study of laws pertaining to the sale of drugs and medicines with the possibility of suggesting a model state law, possibility of enlisting support of the American Bar Association in studies of pharmaceutical legislation, plans for increasing the membership of the ASSOCIATION, better coordination of the programs and activities of sections of the ASSOCIATION and local branches, food and drug legislation, and program for the annual meeting

'It was decided to request the special committee of the Council appointed to study the proposed plan for a Council on Pharmaceutical Practice to arrange for a meeting at an early date for the purpose of discussion and making definite recommendations to the Council "

The invitation of the Executive Committee of the National Association of Retail Druggists to the Council to meet jointly during the N A R D meeting was accepted, and arrangements were made for attendance of members of the Council

In October, A O Mickelsen of Portland, Oregon, was elected *Local Secretary* and later the Multnomah Hotel was selected as the headquarters and the week of August fifth as the time, for the Eighty-Third Annual Meeting

At the annual joint meeting of the Council and the Executive Committee of the N A R D the Council was represented by J H Beal, W D Adams, W Bruce Philip and E F Kelly The agenda of the meeting included the proposed consolidation or federation of the two associations, the proposed federation of the state associations, a more effective plan of cooperation between the two associations, federal food and drug legislation, U S P and N F Publicity, and National Pharmacy Week The decision was to appoint a joint committee to effect a better relation and to cooperate in dealing with the important questions referred to Later, E F Kelly R P Fischelis and R L Swan were approved as the representatives of the AMERICAN PHARMACEUTICAL ASSOCIATION

The contract for printing and binding the YEAR BOOK, Volume 22, was awarded to the Lord Baltimore Press Baltimore, Md, and for printing and mailing the JOURNAL for 1935 to the Mack Printing Company, Easton, Pa

The Special Committee on the Proposed Council on Pharmaceutical Practice held a meeting in Washington on August 18th, and later submitted a report recommending the establishment of a Council on Pharmaceutical Practice to be conducted under the auspices of the A Ph A with certain objectives as outlined and with a membership of nine consisting of the chairmen of the U S P and N F Committees of Revision a representative each from the A A C P and the

N A B P, and a retail, a hospital and a government pharmacist, with the president and secretary of the A P H A as ex officio members. An advisory committee representing twelve organizations in the public health field was also recommended. The recommendations were approved and the special committee continued for the purpose of developing the plan and presenting a more perfected plan at this meeting.

In December, the Committee on Finance submitted an extensive report on receipts and expenditures for 1934 and an estimate of receipts amounting to \$35,800 00 for the calendar year 1935, with a budget of expenses amounting to \$35,580 00 which were approved. The Committee recommended that the policy of strict economy be continued for 1935, especially because of the expenses of revision of the N F and the R B and the inclusion of Pharmaceutical Abstracts for 1935 in the JOURNAL beginning with the March issue.

W Albert Johnson of Baltimore, who has served since 1922, was selected to audit the accounts of the ASSOCIATION for 1934. His report was published in the May issue of the JOURNAL and the Treasurer's report will be published in full later. A summary of his report for 1934 will be included in the Treasurer's report to be given later in this session.

During the year the late Dr Frederick B Kilmer left a bequest of \$3000 00 as a trust fund, the income from which is to be given as a prize for meritorious work in Pharmacognosy, and Dr J H Beal gave \$1000 00 to the Endowment Fund. Special gifts for the AMERICAN INSTITUTE OF PHARMACY will be reported by Chairman Dunning of the Committee on Maintenance.

The second meeting of the Executive Committee of the Council was held on January 5th with all members present. Vice Chairman J H Beal and Former-President R L Swann were present by invitation.

Messrs Fischelis Kelly and Swann as the AMERICAN PHARMACEUTICAL ASSOCIATION representatives on the A P H A N A R D Joint Committee reported on the sessions of the meeting held in Washington on December 5 1934 at which the following unanimous agreements were reached:

1 That the proposal to consolidate the A P H A and the N A R D was disposed of for the present by a formal resolution adopted by the N A R D at its recent meeting in New Orleans.

2 That, although the proposal for some form of affiliation between the two associations did not appear to be practical under the existing conditions and in view of the apparent need for separate organizations to deal with the professional and economic problems of pharmacy an effective plan of cooperation should be worked out.

3 That some practical plan of federating the State Associations with the A P H A and the N A R D more closely than is now the case is necessary.

4 That the Committee favors the further consideration of the suggestion that a plan be worked out for federating the State Associations with both National Associations by providing that members of each State Association become automatically members of the National Associations on a single membership fee plan.

Arrangements were made for a meeting of the Joint Committee early in January preferably on the 8th to further develop the plan to which representatives from the Conference of Pharmaceutical Association Secretaries representing the State Associations, will be invited.

5 With respect to Pharmacy Week.

(a) That the A P H A should take the leadership and should appoint the Committee on Pharmacy Week including several representative members of the N A R D.

(b) That the two Associations should award a joint certificate to the ten best window displays after the first award.

(c) That the annual appropriations of \$250 00 each from the A P H A and N A R D be continued and increased as rapidly as possible.

(d) That as many carefully selected advertisers as possible be requested to give a definite time for Pharmacy Week on the radio and to provide them with a program.

6 That the A P H A should direct U S P and N F Publicity and that it should collect information about the work being done in the various states and work out a standard plan for promoting the use of official preparations.

7 That First Aid Week should be directed by the N A R D and that the A P H A should assist in so far as possible.

The report was received and the representatives were authorized to cooperate in the investigation and consideration of any proposed plan for the federation of state and national associations on a single membership fee or otherwise for submission to the respective associations

The work of the Committee on Maintenance was reported on by Chairman Dunning and carefully considered by the Committee. It was agreed to provide for a special committee on Library and a special committee on Museum to study the development of these divisions of the INSTITUTE and to submit plans with respect to each

The relation of the A P H A to the National Trade Conference was discussed at length but no change in the present status was decided upon nor other action taken

The Committee on Publications submitted an extensive report on the progress of revision of the N F and R B and on the plans for publishing Pharmaceutical Abstracts and other material heretofore appearing in the YEAR BOOK in the JOURNAL. It was decided, (a) to set the retail price of the N F VI at \$5 00 per copy in cloth binding and at \$7 00 in interleaved leather and the price of the Pharmaceutical Recipe Book II at \$5 00 per copy in cloth binding, (b) to approve the selection of Mrs Elsie Kassner as editor of the Recipe Book, (c) to hold a meeting of certain members of the Committee on Recipe Book to hasten revision (d) that on account of expense and the small amount of space in the JOURNAL, it was not practical to publish the report outlining proposed changes in the N F VI, (e) to publish the Pharmaceutical Abstracts for 1935 and other YEAR BOOK material in monthly issues of the JOURNAL beginning in March, in forms of 32 or more pages, separately numbered and indexed and (f) that the YEAR BOOK, Volume 22, for 1933, be issued as promptly as possible

Relations of the A P H A with the National Retail Drug Code Authority on which the secretary was the temporary representative and of which he was the secretary-treasurer was considered at length. It was decided that the secretary should be relieved of this additional work as promptly as arrangements could be made now that the work of the Authority was well organized and that he should serve in an advisory capacity. Later Mr W S Elkins, Jr, was elected *Executive Secretary* of the Code Authority and served in that capacity until June 15 1935 when the Code Authority was discontinued

The meeting of the Executive Committee then adjourned

Oliver A Farwell of Detroit, Mich submitted his resignation as a member of the Committee on National Formulary on account of his retirement, and E Wirth, School of Pharmacy, University of Illinois Chicago was elected to serve the unexpired term on the recommendation of Chairman Gathercoal

In May, the General Program of the Portland meeting was submitted by the Committee on Standard Program, through the secretary and it was later approved

The important changes suggested in the tentative program for the 1935 meeting are

(a) The meeting of the Council heretofore held on Monday has been scheduled for the Saturday preceding. The object is to avoid the conflict with the sessions of the A A C P and the N A B P on Monday and to provide time for the uninterrupted consideration of the important business to come before the Council. It is understood that the meeting of the Council will be continued on Sunday if necessary

(b) Provision is made for a Joint Meeting of the Council and the Executive Committee of the N A R D on Wednesday afternoon, August 7th

(c) Meetings of the Committees on Nominations and on Resolutions are scheduled in order that those who may desire to appear before these Committees will have the opportunity to do so

(d) The Third Session of the House of Delegates is scheduled for Friday afternoon rather than on Friday morning and the short Final Session of the House heretofore held just prior to the Final General Session on Friday evening is omitted since the change above mentioned makes the short session unnecessary. Under the proposed arrangement the sessions of the Sections will be completed by noon on Friday and all resolutions and actions requiring consideration by the House of Delegates can be acted upon at the Friday afternoon session. In addition, time will be available to prepare the final report of the House for consideration at the Final General Session

The contract for printing and binding the Recipe Book II was awarded to the Mack Printing Company Easton Pa which firm had the contracts for the U S P XI and N F VI, and of

ferred to accept that for the Recipe Book on the same price basis as that for the N F VI with necessary increases for the advanced cost of paper, of binding and electrotypes and of printing

The Council was officially advised that the property of the ASSOCIATION in Square 62, Washington D C, had been exempted from taxes by the Commissioners of the District of Columbia as on January 1, 1934, said exemption to continue so long as the property is used for its present purposes

At the second meeting of the Council held in Portland, annual reports were received from the Committees on Finance on Property and Funds, on Publications, on National Formulary, on Recipe Book, on YEAR BOOK and on Standard Program, and from the Commission on Proprietary Medicines These reports covered the activities of the ASSOCIATION during the year with respect to its property funds and publications and they were given careful consideration by the Council in a forenoon, afternoon and evening session The reports and the actions taken on them will appear in full in an early Council Letter to appear in the JOURNAL

The publications of the ASSOCIATION were given special attention The revisions of the National Formulary and Recipe Book are now nearing completion with the expectation that the new editions will be issued later in the year The abstracts of pharmaceutical literature for 1935 are being published in the JOURNAL and with the issuance of Volume 23 either this fall or early in 1936 the YEAR BOOK will be discontinued These changes open the way for the issuance of a popular publication in addition to the JOURNAL, as soon as this is possible

These important developments will be dealt with in the President's Address

Steps were taken toward the publication of the recently completed monograph on Aconite and it is expected that other monographs of interest and value to pharmacy may follow Plans are also under way for the publication of a revision of the Professional Pharmacy, which it is believed will make the publication of greater assistance to the practicing pharmacist The first edition evidently proved to be of value since ten thousand copies of it have been disposed of

The Council nominated D M R Culbreth to the House of Delegates for election as Honorary President for 1935-1936, E F Kelly for Secretary and C W Holton for Treasurer These nominations are being submitted in a separate letter

During the year, 273 members were elected and Dr C A Rojahn of Germany was elected an Honorary Member

E F Kelly R P Fischelis and R L Swain were continued as the representatives of the ASSOCIATION on the A P H A - N A R D Joint Committee

(Signed) E F KELLY, *Secretary*

On motion of F H Frecrieks the report was received and referred to the Committee on Resolutions seconded by W H Porterfield, carried

Chairman Jones called for the report of the Treasurer as the next order of business This was read by Secretary Kelly It follows

Total		\$707,920 84

Of the securities listed above, only 1-\$1000 bond of the City of Detroit (in Life Membership Fund) has failed to pay interest to the amount of \$40 00 As of October 15, 1934 and April 15 1935, \$20,800 Liberty Loan Bonds, 4th issue, 4¹/₄%, were called and were replaced with Treasury Bonds, 2⁷/₈%, with the exception of \$3000 00 transferred from the Life Membership Fund to the Current Fund and \$100 00 each from the Endowment, Centennial and Research Funds which were converted into cash

The property entry represents the actual cost of the site, the landscaping the Building, the approach and the equipment less the mortgage of \$36 400 00 on Lot 7 which it was necessary to purchase in order to acquire the other property required Approximately \$1750 00 is due on deferred payments

On May 10, 1935, the property of the ASSOCIATION was formally exempted from general taxes by action of the Board of Commissioners of the District of Columbia as of January 1, 1934 the date the property was occupied such exemption to continue so long as the property is used for its present purposes The Chairman of the Committee on Maintenance will give further details in his annual report

On account of the closing of Water Street between 22nd and 23rd Streets and the transfer of property between the United States of America and the ASSOCIATION, in accordance with Public Resolution No 18 signed May 1932 and as set out in Council Letter No 3, 1932-1933 see JOURNAL A PH A Oct 1933 pages 1058 to 1065 it became necessary to renumber certain of the lots in Square 62 as shown on the plot plan printed on page 1063

The parts of Lots 12, 13, 14 15 and 17 transferred to the United States as shown in red on the plan, are now numbered Lot 805 The remainder of these lots is now numbered Lot 806 The property transferred to the ASSOCIATION by the United States as shown in yellow on the plan and comprising part of the bed of Water Street and part of U S Reservation No 332B is numbered Lot 807 The order of exemption therefore, covers all of the property owned by the AMERICAN PHARMACEUTICAL ASSOCIATION

The Secretary's report will show receipts from Dues the JOURNAL, the National Formulary, Recipe Book, YEAR BOOKS, Proceedings Bulletins, Badges and Bars, Buttons and Pins and Miscellaneous Items, which are collected by him and deposited in the Secretary's account in the Baltimore National Bank These receipts are transferred by check, accompanied by itemized deposit slips to the ASSOCIATION's checking account in the Merchants and Newark Trust Company from which all budget expenses are paid by voucher check

The report of the Treasurer for the calendar year 1934 was audited by W Albert Johnson, the auditor approved by the Council and his report was published in the JOURNAL for May 1935 page 426 A summary of the Treasurer's report for 1934 is given in this report and the full report will be published later in the JOURNAL

CHARLES W HOLTON *Treasurer*

On motion duly seconded the report was received

Chairman Jones called for the report of the Secretary as the next order of business It follows

REPORT OF THE SECRETARY

May 1, 1934 to June 30 1935

The last annual meeting was held in May on account of the dedication of the AMERICAN INSTITUTE OF PHARMACY and therefore the ASSOCIATION year covered by this report was an unusually long one A special effort has been made to provide for complete reports by the officers, committees and delegates of the ASSOCIATION at this meeting and to avoid repetition, this report will be limited as far as possible, to matters not covered in other reports and to matters which require additional comment

During the preceding ASSOCIATION year emphasis was placed upon the completion of the building and upon the arrangements for its dedication in so far as the ASSOCIATION officers were concerned During this year major attention has been given to the occupancy of the building, to the completion of the landscaping and planting, to the equipment of the building, to the inventory and insurance of furniture and equipment, to arrangements for the maintenance of the building and grounds, to the preliminary development of the Library and Museum, to the neces

sary re adjustment of the accounting system, and to securing exemption from taxation. This necessary and very important work might be referred to as a consolidation of our position and it is a great satisfaction to state that it is now practically completed. The home which the ASSOCIATION has looked forward to for so many years is now a growing concern which can operate within its income and we are now prepared to proceed with the development and extension of its functions. As previously stated, we have been exceedingly fortunate in the attitude of those government officials interested in our project and in the helpful advice and guidance they have so freely given us. They have strongly advised that we proceed carefully, even slowly, in the future development of the AMERICAN INSTITUTE OF PHARMACY. We now occupy a key position which will, because of its surroundings and because of the plans for the further development of the area, become increasingly valuable and increasingly influential for pharmacy and for the ASSOCIATION. The professional and scientific standing of the ASSOCIATION and of its related organizations had been given added recognition by the government in the exemption of its property from taxation.

The act of Congress legalizing the ownership of the property limits the occupancy of the building and the tax exemption is to be continued so long as the property is used for the present purposes. It is therefore, necessary to keep these limitations clearly in mind in planning the future activities of the ASSOCIATION.

The ASSOCIATION, at the Baltimore meeting, by resolution, decided upon the associations and organizations which were to occupy the building. The government officials have known of and approved this action, at the meeting last year, the National Association Boards of Pharmacy decided to move its headquarters to the building and it is hoped that the American Association of Colleges of Pharmacy will soon take similar action since it is important that the work of the three related organizations shall be coordinated as closely and as promptly as possible. A decision also has an evident relation to the development of additional divisions of the ASSOCIATION. Furthermore, the ASSOCIATION's office is now called upon to do work in which it should have the advice and cooperation of the other associations. Every effort should be made to concentrate in the AMERICAN INSTITUTE OF PHARMACY all of the organizations and agencies interested in professional and scientific pharmacy. Otherwise it will become necessary in the interest of efficiency and progress for the ASSOCIATION to create somewhat parallel divisions to those already in existence.

The publications of the ASSOCIATION have also required unusual attention from the office of the ASSOCIATION during the year. The Committee on Publications, the Committee on National Formulary and the Committee on Recipe Book will report the details and it is sufficient here to mention only the outstanding facts.

The contracts for printing and binding the N F VI and the R B II and the contracts for their distribution and sale have been worked out and awarded. The four contracts have been awarded to the Mack Printing Company of Easton Pa., on the basis of their bids and the same firm has the contracts for the U S P XI. The manufacture and distribution of these three valuable publications are, therefore, concentrated, and as the result the savings effected and the increased return will enable the ASSOCIATION to expand this important phase of its work and to render a greater service to the public as well as to pharmacy.

The office has also been called on to give considerable attention to the completions of the revisions of the N F and R B which will undoubtedly bring greater credit to the ASSOCIATION. The issuance of the revisions sometime before January first will also enable the ASSOCIATION to arrange for the partial concentration of the work of revision in the building, and it is believed with considerable saving in operation.

Volume 22 of the YEAR BOOK covering 1933, has just been issued and it is expected that Volume 23 covering 1934, will be issued in the fall. If so, the YEAR BOOKS will be completed. Beginning with the March issue, the material for 1935 heretofore appearing in the YEAR BOOKS has appeared monthly in the JOURNAL bringing this service up to date, and thereby increasing its value to pharmacy and to our members. This work has meant an extra call on the finances of the ASSOCIATION and marks the completion of the first two steps in its plans for its publications and opens the way for the third step which is to issue a more popular professional publication intended for wider distribution and to bring the services of the ASSOCIATION more directly to the pharmacists of the nation. Plans for the popular publication are already under way.

The question of the continued participation of the ASSOCIATION in the work of the National Retail Drug Code Authority which was to be decided at this meeting, was fortunately, or unfortu-

nately settled by a previous decision Your secretary, as is well known, served as the A PH A representative on the Code Authority and as the secretary-treasurer of that body during its existence During part of the time, he also acted as its executive secretary These duties added greatly to his work and to an extent interfered with his ASSOCIATION work The Code Authority maintained a separate office and provided its own office force and the secretary was given every consideration and assistance possible toward lessening the pressure There was, and very naturally, a question as to wisdom of the active participation of this professional and scientific association in an effort principally intended to relieve the economic and commercial situation of the retail druggist It must be evident, however, that professionally the pharmacist is in a good position while, economically, the druggist is in an unsound if not a precarious position, and that the further improvement and even the maintenance of our professional position is considerably dependent upon whether and in what manner the economic situation can be improved At least the A PH A has made a contribution to the solution of the problem and has demonstrated that while it is principally concerned with professional and scientific pharmacy, it is in no sense indifferent to the economic problems of the pharmacist, and apparently with no damage to its professional standing

The 1934 Meeting—The principal addresses and the proceedings of the Council appeared in the May issue of the JOURNAL, the proceedings of the General Sessions, the House of Delegates, the N A B P and the A A C P in the June issue, and the proceedings of the Sections and Conferences in the July issue The papers and other communications have appeared in succeeding issues Although the proceedings were more voluminous, the JOURNAL gave a complete report within three months after the meeting

The resolutions were furnished promptly to the state and national associations, to boards of pharmacy, to the schools and colleges and to the pharmaceutical publications and compliance with the request that support given to those resolutions of joint interest was more general than heretofore

We are further indebted to the pharmaceutical press for the interest and support given our work during the meetings and throughout the year Greater space is given to professional pharmacy each year and the necessity for its practice is more generally emphasized

It is important, however, that the delegates of each state and national association submit a report on the A PH A meeting at the annual meeting of their respective associations Such reports should be devoted to a general explanation of the work of the ASSOCIATION and the accomplishments of the annual meeting

The 1935 Meeting—It has been difficult to carry on arrangements for the annual meeting at such a distance and in a section in which the ASSOCIATION has not visited Local Secretary Mickelsen, Chairman Haack and their associates deserve great credit from their visitors for the time and thought and effort they have so cheerfully and effectively contributed

We are also indebted to the officers and members of the Pharmaceutical Associations of Oregon, Washington and Idaho for their interest in our meeting and their coöperation in arranging for the Tri State Meeting in Portland during this week This is an innovation and one which should have consideration in arranging for our meetings in other sections, especially those at a distance We are also indebted to the pharmacists in other neighboring states who have visited us in such numbers and have coöperated toward the success of this meeting

Mention is due to the individuals, firms and associations who have contributed in one way or another to the success of this occasion The Local Committee has or will pay credit to them by name

The General Program—The Committee on General Program will report on the changes which have been made for this meeting The principal changes are the meeting of the Council beginning on Saturday and the elimination of the short session of the House of Delegates before the final General Session

Otherwise, the program is in general as heretofore We have suggestions for additional sections from hospital pharmacists, government pharmacists and employee pharmacists which indicates an increased interest on the part of these groups Our program is now so full, however, that the needs of special groups will probably have to be taken care of through the creation, if necessary, of sub sections of those sections now operating rather than by new sections

Pharmacy and the Government—A further step in the recognition of pharmacy by the Na

tional Government during the year has been the transfer of the pharmacists from the sub professional to Grade One of the Professional and Scientific Service in the Veterans Administration. Because of the economy orders, the transfer does not give all of these pharmacists the advantage of the salary of this grade but the salary will be available later when the order is withdrawn. Arrangements are being made to work with a committee of pharmacists from this service toward broadening the service which pharmacy can render as their further promotion in grade will depend to some extent on a broadened service.

As the Committee on Pharmacy Corps will report, several conferences have been held with the Surgeon General of the Army and the question at issue now has narrowed itself to whether pharmacists shall be commissioned in the Medical Auxiliary Corps or in a separate Pharmacy Corps, which represents great progress from the time when the question of commissioning pharmacists seemed doubtful.

Three bills were voluntarily introduced in Congress by Representatives McSwain, Evans and Johnson providing for commissioned rank for pharmacists in the Army and Navy which is a further recognition of the changed attitude on this question and on the necessity to improve the pharmaceutical service in these two services.

On the other hand, government officials and representatives are calling on the A. P. H. A. for service more frequently and the INSTITUTE OF PHARMACY is becoming recognized as the source of information on all matters relating to pharmacy.

Such service and information as we can furnish will emphasize the value of pharmacy and in several instances we have been requested to furnish briefs and papers showing the work which pharmacy does and its value as a public health profession.

American Association for the Advancement of Science—The A. P. H. A. has been affiliated with this ASSOCIATION and with its Section N—Medical Sciences—since 1926 and has been represented in its Council by one Councilor. Because of the increase in members of the A. P. H. A. who have joined the A. A. A. S., the A. P. H. A. has this year become entitled to two Councilors, which increase places pharmacy on an equal basis with the other public health professions. Dr. John C. Krantz, Jr., has served as Councilor for several years and Professor Gustave Bachman was appointed this year.

Early this year arrangements were completed to divide Section N into three sub sections to be known as 1 N—Medicine, 2 N—Dentistry and 3 N—Pharmacy, and that at the meetings each subsection should hold a meeting in addition to the meetings of the whole section. The meeting of 3 N—Pharmacy at the recent Minneapolis meeting was a gratifying success in attendance and in the character of the program.

The position which pharmacy now holds in this most representative scientific association through the A. P. H. A. provides further recognition of its professional standing and also a splendid opportunity to illustrate the contributions that pharmacy makes to the advancement of science in this country.

The State and National Pharmaceutical Association—The relations of the A. P. H. A. with these organizations grow closer and more coöperative each year. Although it has not been possible for an officer to attend each meeting of the state and national associations, the A. P. H. A. has been officially represented at most of them.

The A. P. H. A. office is called on more and more frequently for some service by the state and national associations and it is very encouraging to have the calls increase. As the reference library and other divisions in the building develop, we hope to be of greater service.

Local and Student Branches—Although no new branches have been established during the year, most of those listed have carried on successfully during the year and have materially assisted the ASSOCIATION in its work. Inquiries about student branches have recently been received from three schools and it is hoped that with the improvement in conditions, branches will soon be established in every school and college.

Membership—As previously reported the ASSOCIATION has during the depression and at their request, carried a number of members who could not pay dues promptly. A considerable proportion of those in arrears were able to pay during the year either wholly or partially. Those who found it impossible to pay have been removed from the roll and we are now almost back on the old basis. This has resulted in the removal of 612 names during the year. In addition, 42 members have died and 21 have resigned.

During the year, two hundred and sixty four members have been elected, 154 during the present calendar year

The membership at present is approximately 3200 of whom 181 are Life Members and 24 Honorary Members The report of the Committee on Membership will outline the plans for increasing the membership in the near future

Receipts of the Secretary's Office and the Sales of the N F and R B—Attached are financial statements of the receipts from January 1 to June 30, 1935, from Dues, Bulletins, Proceedings YEAR BOOKS, Badges and Bars, Buttons and Pins, and Miscellaneous Items Remittances to the Treasurer and the balance on hand are also set out

The attached reports also give detailed information in reference to the printing binding and sale of the National Formulary and the Pharmaceutical Recipe Book

The Secretary's annual financial report for the calendar year 1934 was submitted with that of the Treasurer, and audited as provided for in the By Laws

E F KELLY, Secretary

On motion of William Gray, seconded by F H Freericks, the report was accepted
 Chairman Jones announced that items 10, 11 and 12 of the program would be deferred until the Second Session of the House of Delegates
 The First Session of the House of Delegates was then adjourned

SECOND SESSION

The Second Session of the House of Delegates was held Wednesday, August 7, at 8 00 P M
 The meeting was called to order by Chairman Rowland Jones The roll call of delegates was omitted as there were more delegates present than required for a quorum

Secretary Jones called for reading of the minutes of the First Session of the House of Delegates This is not repeated as the transactions are printed in this issue of the JOURNAL On motion of J G Beard, seconded by J Lester Hayman, the minutes were adopted

The report on the International Pharmaceutical Federation was read by E G Eberle and approved

INTERNATIONAL PHARMACEUTICAL FEDERATION

Reference has been made to the program of the International Pharmaceutical Federation in the Report of the Historian The program of the meeting which was held in Brussels, July 29th and 30th, is published in the July number of the *Bulletin of the Federation*

A session of the Commission on Specialties was held in Bern, August 1934 The meeting was opened by President Dr L Van Itallie, who is an honorary member of our ASSOCIATION Among the subjects discussed were various determinations and analyses and a resolution was adopted that steps should be taken to secure information from all countries represented in the Federation relative to methods employed and also from various laboratories and establish a central bureau for utilizing the information

Another informative report published in the *Bulletin* compared certain regulations of different countries governing the practice of pharmacy, the questionnaires included the requirements for practice, preparations that require prescriptions and who is responsible for the regulation of the pharmacy and supervising the practice

Responses were secured from Australia, Belgium, Czechoslovakia, Egypt, France Great Britain, Hungary, Poland Sweden and United States

Another contribution published in the *Bulletin* was made by Colonel Dr J Thomann, of Berne and related to the Congress of Military Medicine and Pharmacy The report dealt with the activities of the service References were made in the report of the Historian and comments have appeared in the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

The Twelfth International Congress of Pharmacy (July 30 to August 6, 1935) was organized under the auspices of the International Pharmaceutical Federation, the Belgian National Pharmaceutical Society and the Society of Pharmacy of Antwerp

The annual report of Secretary T Potjewijd is published in the July *Bulletin of the Federation*, also the regulations of the International Congress of Pharmacy —E G EBERLE, Reporter

The report of the Council to the American Association for the Advancement of Science from the A PH A was read by Counselor J C Krantz, Jr

REPORT OF THE COUNCILOR TO THE AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE FROM THE AMERICAN PHARMACEUTICAL ASSOCIATION

Section N, Medical Sciences, N2, Pharmacy

This section was called to order by Dean Wulling of the School of Pharmacy, University of Minnesota at 10 00 A M, June 27, 1935, in the Medical Sciences Building of the University of Minnesota Doctor Wulling outlined in a general way the scope and purpose of the section and introduced the chairman, John C Krantz, Jr, Counselor to the ASSOCIATION from the AMERICAN PHARMACEUTICAL ASSOCIATION

One of the most interesting studies presented was the 'Penetration of Antiseptics in Living Tissues' by Arthur D Hirschfelder He showed by methods of vital staining that many of the commonly employed antiseptics do not penetrate living tissue without producing injury during the course of absorption Of special interest was the paper presented by Harold N Wright on the colloidal properties of the arsphenamines In general, it was shown that the colloidal nature of

the arsphenamine compounds increased their toxicity and diminished their therapeutic efficiency Earl B Fischer presented interesting studies on the deterioration of tincture of digitalis and showed how the modern methods of micro-sugar determinations might be used to study the deterioration of the tincture of digitalis as evidenced by the hydrolysis of the glucosides Heber W Youngken presented a most thorough microscopical study of the methods of staining and identification of the endocrine powders used in the treatment of disease In addition, there were interesting papers presented by A H Uhl on *Cracca Virginiana* and Gustav Bachman on Boric Acid, Joseph B Burt on Mercuriated Derivatives of Thymol and Carvacrol and a paper by John C Krantz, Jr, on the fate of the sugar alcohols in the animal body

The following titles represent the papers presented "Studies on the Penetration of Antiseptics in Living Tissues" Arthur D Hirschfelder and Milan Novak, Department of Pharmacology, School of Medicine, University of Minnesota "A Study of *Cracca Virginiana* L," Lawrence F Madland and Arthur D Uhl Department of Pharmaceutical Chemistry, University of Wisconsin "Colloidal Properties of the Arsphenamines in Relation to Toxicity and Therapeutic Efficiency" Harold N Wright, Department of Pharmacology, School of Medicine University of Minnesota "The Fate of the Sugar Alcohols and Their Anhydrides in the Animal Body," John C Krantz, Jr, C Jelleff Carr and Ruth C Musser, Department of Pharmacology, School of Medicine, University of Maryland "The Application of the Shaffer Smogyi Method in the Study of the Deterioration Rate of Tincture of Digitalis and a Physical and Pharmacological Investigation of the Absorption of Glucosidal Complexes Present in Tincture of Digitalis," Earl B Fischer, R A Gortner and Charles H Rogers Department of Pharmacy and Biochemistry, University of Minnesota "The Microscopy of Powdered Desiccated Endocrine Glands," Heber Youngken, Department of Pharmacognosy, Massachusetts College of Pharmacy "A Physico-chemical and Pharmaceutical Contribution to the Solubility of Boric Acid in Water," George Crossen and Gustav Bachman, Department of Dispensing, College of Pharmacy, University of Minnesota "The Effect of Certain Sugar Alcohols and Their Anhydrides in the Dissociation Constant of Boric Acid" Margarethe Oakley, C Jelleff Carr and John C Krantz, Jr Bureau of Chemistry State of Maryland Department of Health, and Department of Pharmacology, School of Medicine, University of Maryland "Some Mercuriated Derivatives of Thymol and Carvacrol" Joseph B Burt University of Nebraska

The meeting was well attended by local pharmacists, members of the staffs of Pharmacy, Pharmacology and Chemistry of the University of Minnesota Most of the papers presented were discussed at length by those present

The first definite effort of the AMERICAN PHARMACEUTICAL ASSOCIATION to participate in the meetings of the American Association for the Advancement of Science was made by the councilor at the Boston meeting in the winter of 1933 This program was presented in conjunction with Dentistry Owing to extremely inclement weather and a lack of appreciation and mutual understanding between the two professions, the section was not very successful We had not yet found our place in the American Association for the Advancement of Science Through conferences with Dr Henry B Ward, permanent secretary of the organization, and Doctor McKinley of Georgetown Medical School a definite effort was made to establish a permanent section under N, Medical Sciences N3 Pharmacy This has been accomplished In doing this pharmacy has accomplished

1 A definite and permanent place among the medical sciences in the American Association for the Advancement of Science

2 This year's section was as well attended as any of the longer established medical sections

3 Pharmacy had to make no apology for the scientific character of its program

4 The councilor recommends the continuance of participation in the American Association for the Advancement of Science programs biennially, and urges the schools in the vicinity of the meeting to support the program with papers Above all the councilor urges that under no circumstances should the ASSOCIATION compromise with the scientific nature of the program by attempting to make it an applied pharmaceutical presentation

Respectfully submitted,

JOHN C KRANTZ, JR, Councilor to the American Association for the Advancement of Science from
THE AMERICAN PHARMACEUTICAL ASSOCIATION

On motion, duly seconded, it was accepted —Motion by T J Bradley and seconded (See Committee on Resolutions, pages 712 and 714)

Resolutions were presented by the Section on Historical Pharmacy (See Committee on Resolutions, page 712)

Resolutions were presented from R L Irizarry, of the Porto Rico Pharmaceutical Association

A preliminary report was presented by R P Fischels from the National Drug Trade Conference

Report was presented from Indiana Pharmaceutical Association by B V McCullough and referred to Committee on Resolutions (See Committee on Resolutions, pages 712 to 713)

Report was presented by Chairman A Ziesle for the Committee on Student Branches and referred to Committee on Resolutions (See Committee on Resolutions page 711)

The report of the Committee on Cosmetics was received and referred to the Committee on Resolutions (See also page 710, Recommendation 16)

The report of the Committee on National Pharmaceutical Syllabus was presented by Chairman J G Beard It was received and after some discussion by E R Series referred for publication

REPORT OF THE NATIONAL PHARMACEUTICAL SYLLABUS COMMITTEE

Your Chairman is unable to report any concrete progress made by him, during the year ending August first There have been no meetings of the Committee because there has been no need for such meetings Since the present edition of the Syllabus is only a bit more than three years old, the work at this time must necessarily consist of studies made of educational changes, with a view to incorporating the essence of such changes in the next revision

Your Chairman agrees with the recommendation adopted by the American Association of Colleges of Pharmacy at the Portland meeting that the next edition of the Syllabus not be issued until after the new Pharmacopœia has been made official and due time has been allowed for consideration of them and that thereafter the revision be semi-annually

During the past year, seventy three copies of the Syllabus were sold as compared with forty-one copies during the previous year However, twelve copies have been distributed, without cost to foreign organizations who have requested them for study Incidentally, from these foreign bodies have come some comments which were of a complimentary nature

The financial report which follows covers the period from May first, 1934 to August first 1935

J G BEARD, *Chairman*

The report of the Committee on Horticultural Nomenclature was presented by Chairman Heber W Youngken and referred to Council

The report of the Committee on Weights and Measures was presented by Chairman P H Costello It was received (See page 711)

The report of Chairman James E Hancock of the Committee on William Procter Memorial Fund was received and referred to the Committee on Resolutions (See page 714)

Chairman A G DuMez of the Committee on Pharmaceutical Nomenclature reported progress

The report of the Committee on Pharmacy Week was read by Secretary E F Kelly and referred to Council on motion of R P Fischels and H V Army (See page 714)

Secretary E F Kelly read a communication from Dr Henry B Ward, Permanent Secretary of the American Association for the Advancement of Sciences. It was referred to the Committee on Resolutions—see pages 712 and 714.

The report of the Committee on Legislation was called for. Secretary E F Kelly stated that he had received no report from Chairman Ambrose Hunsberger.

COUNCIL REPORT

Secretary E F Kelly read a communication from the Council presenting nominations for Honorary President, Honorary Member, Secretary and Treasurer.

On motion, duly seconded, the communication was received whereupon the names of the nominations were presented and the nominees were elected by unanimous ballot.

Honorary President, D M R Culbreth, Baltimore, Md., *Honorary Member*, C A Rojahn, Halle, Germany, *Secretary*, E F Kelly, Washington, D C, *Treasurer*, Charles W Holton, Essex, Fells, N J.

The report of the Committee on Nominations was presented by Chairman R C Wilson. For *President*, George D Beal, Pennsylvania; John Culley, California; Andrew G DuMez, Maryland; *First Vice President*, William J Husa, Florida; J Leon Lascoff, New York; Heber W Youngken, Massachusetts; *Second Vice President*, A O Mickelsen, Oregon; E R Serles, South Dakota; Edward Spease, Ohio. For *Council*, Walter D Adams, Texas; F E Bibbins, Indiana; W Mac Childs, Kansas; H C Christensen, Illinois; C J Clayton, Colorado; C H Evans, Georgia; R P Fischelis, New Jersey; Ernest Little, New Jersey; A L I Winne, Virginia.

The report was signed by Arthur D Baker, Frank Nau, H C Christensen, Hugo H Schaefer, W M Hankins, John C Krantz, Jr., R C Wilson, *Chairman*.

A G DuMez requested that his name be withdrawn as nominee for *President* and Edward Spease the withdrawal of his name as nominee for *Second Vice-President*.

Chairman Jones said that there were two ways open for filling the vacancies—to accept nominations from the floor or to refer the report back to the Committee on Nominations. On vote it was decided to refer the report back to the Committee and it was so ordered.

The Committee on Nominations also presented nominations for officers of the House of Delegates: Roy B Cook, of West Virginia, for *Chairman*, and C Thurston Gilbert, of Connecticut, for *Vice Chairman*. There being no further nominations from the floor, the nominees were duly elected.

The Committee on Nominations retired.

Chairman Theodore J Bradley presented the report of the *Committee on Transportation*, which on motion duly seconded was accepted. He then presented the report of the *Committee on Place of Meeting*. The Committee's report recommended that the Association meet in Dallas, Texas, in 1936, the meeting to be held if possible during one of the last two weeks in August.

Motion was made by F H Freericks, seconded by F C A Schaefer, that the report be accepted, it was so voted.

Walter D Adams and H F Hein expressed appreciation for the vote favoring Dallas, Texas, and assured a welcome to the members and that everything possible would be done to bring about a successful meeting. It was also suggested that a post convention tour might be arranged to Mexico City.

Chairman Jones called for a supplemental report of the Committee on Nominations. The name of E Fullerton Cook was presented as the nominee for *President* to fill the vacancy and that of James C Munch for *Second Vice-President*.

A motion was made by Theodore J Bradley, seconded by F C A Schaefer, that the report be accepted. On vote the nominees were unanimously accepted.

The report of the Committee on the Study of Pharmacy (Program item No 6) was called for—Chairman Fischelis stated that he would present the report on Friday.

The Second Session of the House of Delegates was then adjourned.

THIRD SESSION

The Third Session of the House of Delegates was convened by Chairman Rowland Jones, Jr., Friday, August 9, at 2 15 P M. Roll Call was omitted; the minutes of the Second Session were

read and approved on motion of Charles J Clayton, a second, and vote (The minutes of the Second Session precede)

The report of the delegate to the National Drug Trade Conference, R P Fischelis, was received

The report of the Committee on the Study of Pharmacy, R P Fischelis *Chairman*, was received

President R P Fischelis called attention to several resolutions introduced at the Conference of Pharmaceutical Law Enforcement Officials

Resolution I "Restricting the sale of drugs and medicines by stores where there is no registered pharmacist"

Resolution II "Licensing all manufacturers of drugs and medicines, requiring some standard"

Resolution III Relating to Patent Medicines

Resolution IV "That members of the Conference cooperate with the various branches of the medical profession—physicians, pharmacists and nurses—in matters having to do with economic conditions as they affect these three professions"

Resolution V "Setting forth that the Conference believes that more extensive use should be made of the knowledge possessed by pharmacists" There was no discussion

Chairman Jones introduced Mrs Edna Gleason, of California, who made several presentations Mrs Gleason brought a message of appreciation from the Chinese Pharmaceutical Association of California She stated that the ASSOCIATION cooperated with the druggists of California 100 per cent and they had asked her to bring a greeting from them to the AMERICAN PHARMACEUTICAL ASSOCIATION It was her intention to present one of the gifts (Chinese vases) to President Fischelis and the other to the incoming president, P H Costello President Fischelis expressed his thanks Mrs Gleason then presented Mr Costello with a "Goddess of Good Luck," she was certain that he would need it, he expressed his thanks

Chairman Jones said that the House of Delegates appreciates the message from the Chinese Pharmaceutical Association of California

The report of the Committee on Prerequisite Legislation was presented by Chairman C B Jordan, on motion, duly seconded, the report was accepted for publication, it follows

REPORT OF THE JOINT COMMITTEE OF THE A P H A, N A B P AND A A C P ON PREREQUISITE LEGISLATION

The members of your Committee have endeavored to contact all states in which prerequisite legislation was considered The members of the Committee were assigned the duty of contact as follows Dean H Evert Kendig was assigned a report of the District of Columbia Bill, Carl G A Harring a report of the activity in Massachusetts, and Dean William B Day was assigned the task of securing information from Vermont regarding prerequisite legislation Your chairman assumed the responsibility for the other states in which there was prerequisite activity The report is as follows

Massachusetts—Mr Harring reports that a prerequisite law was introduced in the Massachusetts Legislature but was killed in Committee by the usual plea that it would "prevent the poor boy from having an opportunity" Mr Harring, however, indicates that there will be a different attack next year and expresses hope for success

Michigan—Director E J Parr, of Drugs and Drug Stores in Michigan, reports that House Bill 500 was passed and signed by the Governor This Bill requires that "on and after January 1, 1938, every applicant for such a certificate shall furnish satisfactory evidence that he graduated from an accredited school or college of pharmacy" Heretofore Michigan has had a law requiring only two years of college attendance It is, of course, anticipated that the Board of Pharmacy will recognize no course in pharmacy of less than four years So, beginning with January 1, 1938, Michigan will join the states that have full prerequisite laws

Iowa—Dean W J Teeters, of the College of Pharmacy of the University of Iowa, reports that the Iowa law was amended so that on and after July 4, 1936, every applicant must be a graduate of a school or college of pharmacy recognized and approved by the Board of Pharmacy Examiners, and further that no college of pharmacy shall be approved by the Board of Pharmacy Examiners as a college of recognized standing unless the entrance and graduation requirements are

equivalent to those prescribed by the American Association of Colleges of Pharmacy So, Iowa has joined the group of states of full four-year college prerequisite requirement

Vermont—Secretary W B Eastman of the Vermont State Pharmaceutical Association writes Dean Day as follows

"I am sorry to have to inform you that we have no prerequisite law A bill was introduced two years ago, but was killed In a state like ours where the Legislature is made up very largely of farmers it is very hard to get any legislation passed that is of benefit to the druggists"

Tennessee—Secretary J B Sand, of the Tennessee Board of Pharmacy, reports to me as follows

"A prerequisite bill was introduced by the Tennessee Pharmaceutical Association in the recent session of the Tennessee Legislature but never got past the steering committee"

Arizona, New Hampshire and New Mexico—Secretary Christensen of the N A B P reports that these states have recently enacted legislation requiring graduation from a recognized college of pharmacy as a prerequisite to taking the examination for registration as a pharmacist He also reports that the District of Columbia and Porto Rico have prerequisite laws Missouri is requiring, by board ruling, some college training of applicants for pharmacy license

Your Committee is delighted to report the progress of prerequisite legislation in Arizona District of Columbia Iowa Michigan New Hampshire New Mexico and Porto Rico This leaves the states of Massachusetts Vermont, Tennessee and Nevada, and the territory of Alaska as the only commonwealths without prerequisite legislation

C B JORDAN, *Chairman*

The report of the Committee on Pharmacy Corps in U S Army was read by Chairman E H Kendig The report was on motion duly seconded accepted for publication, it follows

REPORT OF THE COMMITTEE ON THE ESTABLISHMENT OF A PHARMACEUTICAL CORPS IN THE UNITED STATES ARMY, 1935

Your committee was instructed by Resolution No 17, adopted by the ASSOCIATION in Washington last year to secure the establishment of pharmacy properly in the United States Army, and our efforts have been directed to the objective While we cannot report consummation of your desires, we believe the year's efforts have brought us much closer to achievement than heretofore In fact if the ASSOCIATION is willing to accept for the present in lieu of the separate pharmacy corps the proposal of the Surgeon General to commission a fair number of pharmacists in the proposed Medical Auxiliary Corps it is highly probable that during the coming year pharmacy will receive the recognition for which it has so long and earnestly striven

Your Committee has worked in cooperation with the committees of the American Association of Colleges of Pharmacy and National Association of Boards of Pharmacy and has had the very valuable assistance of President Fischelis and Secretary Kelly

In behalf of the committee, whose members are widely separated geographically, President Fischelis and Secretary Kelly had a conference in Washington on February 18th with Surgeon General Patterson and we quote from a letter of President Fischelis reporting the result of the conference to your chairman

"He (Surgeon General Patterson) told us that whereas the plans of the War Department contemplate an increase in the standing army, no corresponding increase in medical personnel has been provided for in any proposed legislation The Surgeon General stated that he considered it important to obtain additional personnel to carry on the work of the Medical Department in view of the increased number of enlisted men He hoped to secure the cooperation of all professional societies represented by commissioned personnel in the medical and allied departments of the army when the time comes to press for an increase in the personnel coming under his direction He stated that he recognized fully the importance of proper supervision of the pharmaceutical work in the army, but impressed upon us that ordinary dispensing such as is carried on in the army, need not be done by commissioned pharmacists He was of course, in favor of having a certain number of commissioned pharmacists attached to the Medical Corps to supervise dispensing and other pharmaceutical activities However he laid stress on the fact that in order to justify the expense of commissioned pharmacists in the higher ranks they would have to assume executive duties which go far beyond ordinary pharmaceutical work in civil life"

"He is not an opponent of commissions for well trained pharmacists who are graduates of four-year college courses, but he pointed out that the needs of the service would be met by assigning approximately one third of the commissions in the Medical Administration Corps to properly qualified pharmacists. He is absolutely opposed to a separate corps as he considers it inadvisable to detach the various auxiliary services of the Medical Department of the army from the Medical Corps itself."

Supplementing his statements of February 18th, under date of March 11th the Surgeon General wrote as follows:

"I heartily favor and will support legislation liberalizing the eligibility requirements of this Corps or, as we would prefer to call it, a Medical Auxiliary Corps. There are now two bills before Congress relative to the Medical Auxiliary Corps which, like all such piecemeal legislation, are unsatisfactory and which I must oppose. However, I believe that at the next session of Congress a new Medical Department bill will be introduced containing desired changes for all branches of the Medical Department and which will include provision for an adequate number of qualified pharmacists in the commissioned grades of that Corps."

That you may be informed even more fully of the attitude of the high command of the Army toward pharmacy and have a better understanding of some of the problems which must be considered by the Army administration, we quote from a letter written by Surgeon General Patterson, April 15th, in reply to a communication from Representative Jed Johnson of Oklahoma, asking what the attitude of the department would be to legislation proposing to increase the Medical Administrative Corps to include forty commissioned officers as pharmacists:

"I have your letter of the 8th instant and am very glad to give my opinion concerning the need for pharmacists in the Medical Department of the Army."

"For some years it has been recognized that it would be desirable and save much of the valuable time of medical officers to have a sufficient number of registered pharmacists in the Army responsible to the Surgeon General for the general dispensing of medicines in our larger hospitals and for the instruction of enlisted men who necessarily have to do the dispensing in the smaller hospitals. However, the plan that the Army has followed ever since the earliest days of its existence, and which is still in force, is that in *every hospital* an officer of the Medical Corps, in addition to his other duties, is directly in charge of the pharmacy and instructs the enlisted men who do this work in the pharmacy or dispensary. However, you may not know that in the Army the actual compounding of medicines is reduced to the minimum. We buy the larger proportion of all of our drugs in such form as to be ready for immediate use, for example, pills, capsules, tablets, certain tinctures, etc. At all of our larger hospitals, and to a lesser extent in the smaller ones, we naturally are obliged to compound some medicines and to make up stock mixtures, but there is little actual compounding of medicines in the Army compared to that carried on in drug stores in civil life. Another reason why there is less actual compounding of medicines in the Army is that we have a restricted Supply Table which does not include hundreds of drugs used in civil life. For reasons of economy and to lessen bulk and expense of transportation our list is confined to essential drugs in commercial use of approved value, specifics, and the newer remedies evolved from time to time believed to be of therapeutic value. In the Army the first assistant of the officer in charge of a pharmacy is usually a non-commissioned officer of some years of experience who has been well taught."

"At the present time there are forty registered pharmacists among the enlisted force of the Medical Department, approximately two thirds of whom are engaged in the dispensing of medicines. These men were trained in pharmacy in civil life prior to their enlistment in the Army. In the Navy pharmacists are enlisted men though the higher ones holding the grade of Chief Pharmacist are given warrants corresponding to the grade of Warrant Officer in the Army. They are not commissioned officers."

"A careful canvas of our hospital situation in the Army indicates clearly that we would not be justified in having high grade pharmacists, college graduates on duty at every small hospital. The amount of dispensing of medicines would not require their full time and the services of such specially educated men would be largely wasted if restricted entirely to the field of pharmacy. The only places where highly qualified pharmacists would fit into the present organization of the Medical Department of the Army would be at general hospitals and a few large station hospitals, but only in a definitely limited number."

"The present Medical Administrative Corps in many respects has not proven satisfactory to the Army in peace time. We could use the services of specially educated officers other than those who only have administrative qualifications, to assist the officers of the Medical Corps in their many and varied duties. I proposed to the War Department shortly after I became Surgeon General that a bill to reorganize and increase the strength of the Medical Department of the Army be introduced into Congress. At that time (October 1931) this was disapproved by the War Department on the ground that it was not a favorable time, owing to the economic situation. However, it will not be economy to postpone such action indefinitely. We feel that a certain number of pharmacists should be commissioned in the Medical Department of the Army, to assist in and be largely held responsible for the pharmaceutical service, just as medical officers are now and have been in the past, and that they should be incorporated into a corps of officers which will include other men who possess special knowledge and qualifications of a character which will be of assistance to the Medical Department as a whole in carrying out its mission. *i. e.*, the exclusion of the unfit, the prevention of disease, the maintenance of the health of the Army, and the care and treatment of military personnel whenever sick or injured in garrison or field.

"The Medical Administrative Corps as now constituted is therefore not satisfactory, because it is limited strictly to men who are supposed to have administrative qualifications. As a matter of fact, the title of this group should be changed to the Medical Auxiliary Corps in which could be placed men who have knowledge of many of the adjunct sciences or those which may be of distinct assistance to the medical service. For example, it would be an advantage to have several sanitary engineers in the new Medical Auxiliary Corps (when authorized by Congress), one or two botanists, one or two good hospital architects, one or two professional chemists, one or two entomologists, a group who are graduates of colleges of pharmacy, as well as former enlisted men who have had training in Army administration. All candidates for this Corps, however, should only be commissioned after a strict examination along general lines and in their specialties, with the requirement that no one should be eligible to take the examination unless of proper age, physically qualified, and a graduate of a four-year course in a college or university. In the case of candidates from the enlisted ranks, the examination would be of such a nature as to reveal evidence of knowledge equivalent to a college degree.

'You will see from what I have said that we are in favor of having certain changes made in the organization of the Medical Department of the Army, which will include the creation within it of a Medical Auxiliary Corps, and provide, among other specially trained men, such number of pharmacists as the actual needs of the Army justify. The Medical Auxiliary Corps in time of peace need never be a large one, but effort should be made to build up a Reserve of such officers for use in time of war.

'I believe that next year will be a favorable time for the Surgeon General to propose again to the War Department the introduction of a bill in Congress which, if enacted, will increase the strength of the Medical Department and authorize some of the organizational changes I have mentioned.

"My suggestion is that nothing be attempted at the present time, but that whenever a bill for the Medical Department is forwarded to Congress by the War Department all those interested, including the pharmacists' organization, should support the bill to insure its passage."

A conference with the Surgeon General was arranged for April 6th, and he also acceded to our request for an opportunity to visit one or more hospitals and arranged for those interested to observe the pharmaceutical requirements under the present form of organization.

To this meeting were invited representatives of the American Association of Colleges of Pharmacy and the National Association of Boards of Pharmacy. The result of this meeting was given publicity by a bulletin which coincident with its release to the pharmaceutical press was mailed to the deans of the schools of pharmacy and the secretaries of all state associations. The bulletin read as follows:

PHARMACEUTICAL SERVICE IN THE ARMY

"Representatives of the AMERICAN PHARMACEUTICAL ASSOCIATION, the American Association of Colleges of Pharmacy and the National Association of Boards of Pharmacy, met in Washington on April 5th and 6th at the invitation of Dr. H. Evert Kendig of Philadelphia, who is Chairman of the A. P. H. A. Committee on Pharmacy Corps, to continue the joint efforts to improve the

pharmaceutical service for the Army and to secure better recognition for pharmacists by improving their status

"Those present were R P Fischels E F Kelly for the A Ph A , Ernest Little, Townes R Leigh and A G DuMez for the A A C P , and R L Swain for the N A B P Unfortunately, Chairman Kendig was unable to attend on account of illness

"The first joint session was held on the evening of April 5th, when plans to broaden the work of army pharmacists were considered Saturday forenoon was occupied by visits at the invitation of the Surgeon General to the hospitals at the Army Medical Center and at Fort Myer The pharmacies at those hospitals and the work carried on in them were carefully inspected A conference with Surgeon General Patterson and Colonel McDonald followed, during which proposed legislation looking to a commissioned rank for Army pharmacists was discussed

"It is expected that a similar joint committee meeting will be held in Washington during June or July and that an encouraging report of progress can be made at the Portland, Oregon, meeting, August 5th-10th

"The efforts to secure a satisfactory status for pharmacy in the Army and the Navy have been interrupted by the reductions affecting these services during the depression This work is being taken up aggressively again and when a satisfactory program is worked out the national state and local associations will be informed and their cooperation requested "

The continuity of the committee's effort was somewhat interrupted by the expiration of General Patterson's term as Surgeon General He was succeeded June first by Colonel Charles Ransom Reynolds with the Rank of Major General

Secretary Kelly endeavored to arrange a meeting between our group and the new Surgeon General and in this connection was invited by General Reynolds to call June 17th to discuss plans for the meeting with the Committee As the appointment tentatively set for some day in July had to be canceled owing to General Reynolds suddenly leaving for Denver and San Francisco on official business, we insert a courteous and friendly letter which Surgeon General Reynolds wrote to Secretary Kelly July 18th It is informative and indicates the attitude of the new Surgeon General toward Pharmacy in the Army

"Official duties necessitate my leaving the office to day for a tour of inspection of Army General Hospitals within the continental United States, extending over a period of approximately three weeks I regret that this tour will delay the date of a conference to be held upon your request between myself and representatives of the AMERICAN PHARMACEUTICAL ASSOCIATION regarding proposed legislation authorizing the admission of registered pharmacists into the military service as commissioned officers

"My predecessors have favored legislation authorizing the reorganization of the Medical Administrative Corps into a Medical Auxiliary Corps wherein may be commissioned registered pharmacists sanitary engineers and other professional specialists not now provided for in the Medical Administrative Corps, as well as administrative specialists Unfortunately, economic conditions have prevented any increase in commissioned personnel of the Medical Department since 1920 Although I have not yet had the time to analyze thoroughly the needs of the Medical Department for additional commissioned personnel since my appointment recently, I may state that, in general, I agree with my predecessors on this subject I would like to make it clear that I do not favor the establishment of a separate Pharmacy Corps in the Medical Department

"I expect conditions in the near future to be more favorable for securing legislation providing for an increase in the Medical Department Upon my return to the office next month I shall give careful thought and consideration to proposed legislation for increasing the Medical Department

"I appreciate the interest of the members of the AMERICAN PHARMACEUTICAL ASSOCIATION in the Medical Department of the Army and shall be pleased to confer with their representatives sometime after September first, regarding the pharmaceutical service in the Army and its improvement

"Please extend my greetings and best wishes to the members of the AMERICAN PHARMACEUTICAL ASSOCIATION assembled in annual convention in Portland "

Bills to improve the pharmaceutical service in the army were introduced in the House of Representatives during the present session by Representatives McSwain of South Carolina, Evans

of New York, and Johnson of Oklahoma They were all referred to the Committee on Military Affairs where they stayed

From conversations held with congressmen, the general impression of your committee is that the members approached are friendly to a proposal to improve the pharmaceutical service in all branches of the Military Service and will support legislation having the approval of the ASSOCIATION and the Surgeon General As the Surgeon General is on record as favorable to the granting of commissions to properly qualified pharmacists in the proposed Medical Auxiliary Corps, and as he is very definitely opposed to the establishment of a Separate Pharmacy Corps your committee recommends

First —That the committee be continued and that it be instructed to continue its efforts to effect improvement in the pharmaceutical service in the Army, and to obtain therefor pharmacy the recognition and status to which it is entitled by virtue of its traditions and the useful service which it is prepared by education and training to render

Second —That the committee be instructed to cooperate with the Surgeon General in obtaining the passage of legislation which will bring about the substance of recommendation number 1 If the objective as stated in the recommendation number 1 cannot be attained by this procedure, we recommend

Third —That the committee be instructed to obtain the desired improvement in the pharmaceutical service and its concomitant recognition in the Army by direct appeal to Congress

Respectfully submitted

ROBERT L SWAIN B TAPPEN FAIRCHILD
FRANK L MCCARTNEY A L I WINNE
H EVERT KENDIG, *Chairman*

The report of the Committee on Prescription Tolerances was presented by Chairman Hugo H Schaefer, it will be published with the proceedings of the Section on Practical Pharmacy and Dispensing

Robert P Fischelis stated that the report of the Committee on Legislation Ambrose Hunsberger, *Chairman* would be mailed

The report of the Committee on Endowment Fund, James H Beal *Chairman*, was read by Secretary E F Kelly It was received and the Committee continued it follows

COMMITTEE ON ENDOWMENT FUND

It was agreed at the Washington meeting last year that the Committee on Endowment Fund would refrain from special activity until the planned campaign of the Committee on Maintenance Fund had been consummated

Nevertheless the Endowment Fund has continued to grow slowly A donation of Federal Farm Mortgage Bonds amounting to \$1000 00 was received during the year, and on June 30 1935 the Endowment Fund amounted to \$17 020 73

The Chairman has also received the promise from a member of the ASSOCIATION who has been more than usually successful in the practice of his profession that a provision will be inserted in his Will making a substantial addition to the permanent funds of the ASSOCIATION

J H BEAL *Chairman*

The report of the Committee to Draft a Model Restricting Distribution of Drugs and Medicines to Pharmacists W Bruce Philip *Chairman*, was presented by R L Swain who proposed that the report be referred for publication, it was so ordered

REPORT OF THE COMMITTEE TO DRAFT MODEL ACT RESTRICTING DISTRIBUTION OF DRUGS AND MEDICINES TO PHARMACISTS

It must be quite evident to all of you that those believing in and appreciating the profession of pharmacy should desire that drugs and medicines be sold to those qualified by law as pharmacists The states through their public and private school system have spent a considerable portion of the people's money to educate pharmacists to the point where they are privileged as graduates of schools of pharmacy to take state board examinations and become qualified pharmacists There is no reason why the states should permit others not so qualified to deal in the selling of articles that are so essential to public health It must be self evident that the public is

interested and should be protected, even if necessary by an extreme law, where the life and the health of the citizens of the states are involved by the handling of a commodity. With this in mind I review the principal status of state laws as now existing in the United States.

Most states restrict the filling of physicians' prescriptions to registered pharmacists. Even these laws have exceptions, the principal exception being that physicians, dentists and veterinarians may fill prescriptions for their own patients. State laws have frowned upon the allowing of qualified physicians, qualified dentists and qualified veterinarians to fill prescriptions for other qualified practitioners. These exceptions are based mostly upon the need for political compromise when the laws were just made rather than upon any general common sense principle. It is reasonable to presume that any practitioner who has to pay for medicine dispensed is apt to consider the cost of the medicine rather than the best interests and need of the patient. This exception is not in the public interest. While from a point of theory I feel sure the committee thinks that any law finally decided upon should restrict the filling of all prescriptions to the registered pharmacist, I do not believe it is politically practical to exclude other professional people in the medical group from filling their own prescriptions.

Next on the list of medicines largely restricted to registered pharmacists is the sale of poisons. Most states at the present time have laws restricting the sales of poisons to registered pharmacists. This is distinctly an admission that the registered pharmacist is the best qualified person to handle strong and powerful drugs and chemicals in the interests of the public. Here also we have exceptions that are to be found in these laws. These exceptions are also largely politically and economically needed to have a poison law passed by the average state legislature. Horticulturists and agriculturists use insecticide in large quantities. It is not exceptional for a ton of a poison to be sold to a member of this group. This means that the shipment from the manufacturer is usually direct by rail to the horticulturist or agriculturist. It is also common for the state to supply or supervise the sale of insecticide. This means distribution of these poisons through other than drug stores. Here I feel the pharmacist was not alert to follow his advantage of education and service in the earlier days and demand and receive the distribution of poisons needed for the spraying of vegetables and fruits. We find our state poison laws, therefore, in many states limiting the sale of insecticides and poisons to the registered pharmacist when they are sold in original packages such as are used by the average householder—roughly speaking in pound lots and less.

Next we may consider the sale of narcotics. With the exception of exempt narcotics these are sold through hospitals and state institutions and through the channels of the retail drug stores. I feel that the pharmaceutical associations will receive both state and federal support in enacting state laws restricting the sale of all narcotics that is, including the exempt narcotic preparations by registered pharmacists. Probably hospitals and penal institutions will have to be excepted in handling narcotic drugs. Even here registered pharmacists should be employed.

New York has led the way in restricting that vast field of medicine known as proprietary medicine through the channels of the drug store. New York has enacted a law requiring supervision of sales by registered pharmacists where poisons and powerful medicines are ingredients in proprietary medicines. Pages after pages could be written why registered pharmacists should sell all medicines of interest to public health. Our opponents' strongest argument seems to be that in the past grocery and general dealers have sold proprietary and household medicines without detriment to the public health. This statement, though, is general and cannot be supported by facts and figures. The damage to public health by the general sale of medicines can never be proved in my opinion or accurately estimated. I understand Pennsylvania also has a restricting law as to some proprietary medicines.

This briefly covers the résumé of the present legal supervision of the sale of drugs and medicines. There are, it must be remembered, two important factors to any restrictive law. One is the need for a rigid enforcement of the law and the other is the legality of any law passed. It is common knowledge that many laws restricting the sale of drugs in some states are not enforced. This can be corrected usually by an adequate sum of money being granted to the state enforcement authorities, a sum sufficient for inspection and prosecution. The legality of a restricting law can often only be determined by a test in Court. It must be admitted that the police power of the states is far in excess of the so called police power of our Federal Government. The recent United States Supreme Court decisions are therefore not in point when considering the possible unconsti-

tutionality of a state law regulating the sales of medicines and drugs, permitting them only to be sold by registered pharmacists

This committee was appointed at a time when a large majority of the state legislatures were in session. It was not at that time advisable in my opinion to endeavor to collect material for such a state law as is desired. This law is too important for snap judgment to be taken and a poorly prepared law presented to the states for introduction into the then convening state legislatures. Now that the stage legislatures have adjourned and state pharmaceutical associations have met and their deliberations are a matter of record, a restrictive law can now be considered. The fall of the year is the best time to start collecting the necessary data for the formulating of the desired law. At least six months should pass in collecting this material. Then the committee should endeavor to frame such desired legislation as may help toward this much talked of ideal. After this a suggested law should be drafted and published, constructive criticism asked for and then a year and a half or two years hence a bill be finally discussed for the state associations to consider getting behind and introducing in their respective legislatures.

Therefore, in conclusion I ask that this committee be continued although I also suggest that the new president of the AMERICAN PHARMACEUTICAL ASSOCIATION be free, if he desires to appoint a new chairman and a new committee. I also offer the suggestion that it may be better in the opinion of the president or the ASSOCIATION that this committee function as a sub committee of the legislative committee or some other committee that has already been appointed having a similar obligation and one that is collecting similar, if not the exact data from the various states.

On behalf of the committee I wish to state that the other members of the committee are experienced, seasoned legislators. Their words and opinion are to be carefully considered at all times. They are competent to help form any model law that pharmacy needs. Personally I would suggest their retention on a new committee when appointed. The fact that this committee has not reported a law at this time is in no way due to their neglect or their unwillingness to do their part.

W BRUCE PHILIP, *Chairman*

The report of the Committee on Development of Pharmacy Laws was called for, Chairman R L Swan made a verbal report and will be followed by a written report to be published.

Secretary E F Kelly presented a verbal report for the Committee on Press Relations. In concluding he thanked the members of the Local Committee through whom the fullest press report of the meeting had been made possible.

Secretary E F Kelly reported verbally for the Committee on Professional Relations. L A Seltzer, *Chairman*. Report is to be mailed. On motion by C T Gilbert and a second the report was referred to Council.

The delegate of the Scientific Section, F E Bibbins, presented the report for the Section, it follows:

To the House of Delegates, AMERICAN PHARMACEUTICAL ASSOCIATION

The Scientific Section held three regular sessions and one joint session with the Section on Practical Pharmacy and Dispensing.

Fifty one papers were presented and discussed. Thirty-nine papers were presented by title.

The following recommendations from the Committee on Chairman's address were approved. The report follows:

Your Committee commends the Chairman for his thoughtful address.

We approve Recommendation 1. 'The Board of Review on Papers shall be given power to reject or accept papers, or parts of papers, for publication and to require revision by the authors when necessary.'

I move that the Scientific Section instruct the secretary of the Section to request that the Council of the AMERICAN PHARMACEUTICAL ASSOCIATION grant the authority to the Board of Review on Papers necessary to carry out the objective of this recommendation.

We approve Recommendation 2. The Board of Review on Papers shall be increased to ten members each serving for five years. They shall be appointed by the Chairman. Any vacancies shall be filled by the contemporary Chairman.

I move that the Board of Review on Papers be increased to ten members, that the Chair

man appoint two members to serve for a term of five years, two members to serve for a term of four years, two members to serve for a term of three years, two members to serve for a term of two years, two members to serve for a term of one year, that in 1936 and in each year thereafter two members be appointed by the Chairman to serve for a term of five years "

Your Committee approves the intent of Recommendation 3 "The Board shall draw up a list of rules and regulations for the guidance of its members and of authors This list shall be presented for approval by this Section at the next annual convention " Since instructions to authors are now carried in the JOURNAL and are subject to continuous revision at the request of members and with the consent of the Editor, your Committee believes that no action on this recommendation is necessary at this time

Recommendation 4 "That a regulation be adopted requiring each paper to be presented as given on the program either in total or in abstract, and original copies of the paper to be turned over to the secretary at that time In each case of inability to appear in person, the author should delegate some one else to present the paper " Your Committee does not approve this recommendation We feel, however, that the intent of the recommendation should be carried out as effectively as possible by the officers of the Section We do not feel that the acceptance of papers by title should be prohibited Signed by the Committee LOYD E HARRIS C O LEE, FRANCIS E BIBBINS, F O TAYLOR, GLENN L JENKINS, *Chairman*

The report of the Committee on Ebert Prize awarding the prize this year to Marvin J Andrews for his paper presented at the Washington meeting on 'Determination of a Reasonable or Permissible Error in Dispensing' was approved

The following officers were elected and installed

Chairman, H M Burlage, *First Vice Chairman* Glenn L Jenkins *Second Vice Chairman* J C Ward, *Delegate to the House of Delegates* E V Lynn

(Signed) F E BIBBINS, *Secretary*

The report of the Section on Historical Pharmacy was presented by Heber W Youngken *Secretary*, it follows

The Section on Historical Pharmacy held two sessions on August 7th and August 8th, during which twenty six papers covering a great variety of historical subjects were presented fourteen of which were read by title

The following officers were elected for the ensuing year

Chairman, Heber W Youngken *Secretary*, Loyd E Harris *Historian* Eugene G Eberle, *Delegate to the House of Delegates*, C O Lee

(Signed) H W YOUNGKEN, *Secretary*

(See also report of Committee on Resolutions, page 712)

The report of the Section on Education was presented by George C Schucks as follows

Twenty one papers were presented before the Section on Education and Legislation on a wide variety of subjects of educational interest

There were two meetings of the Section and one joint meeting with the Conference of Pharmaceutical Law Enforcement Officials All of these meetings were well attended

The following resolutions were presented and adopted

'To the end that helpful information regarding ways and means of encouraging the prescribing of U S P and N F drugs and preparations by dentists be disseminated and made available to the pharmacists of this country, and to the end that the good work of one community or state may not be lost to other communities or states, therefore, *be it resolved*

'That a Committee be appointed—to be known as the National Committee on Professional Information Pertaining to Dental Pharmacy Its specific function shall be

'*First*—To study the methods used by the various local county and state organizations in their efforts to bring before dental men usable information on U S P and N F drugs and preparations

'*Second*—To present to the pharmacists of the nation at our next annual convention a digest of constructive ideas gathered from such a survey and other sources

'*Third*—The Committee is to act as a center for receiving and disseminating information which will increase the pharmacist's opportunities for professional scientific service to the dentist "

Be it further resolved that the Chairman of the Section on Education and Legislation appoint a Committee to study the problem of cooperation with hospital pharmacists and their service to the allied medical professions

Resolved, that the Section on Education and Legislation go on record as requesting the AMERICAN PHARMACEUTICAL ASSOCIATION to create a body or bodies with the necessary working facilities to give the pharmacists in this country up to date information on such pharmaceutical and medical material as new drugs preparations, formulas standards, plans for detailing doctors and dentists, as well as other medical groups, and other information which will prove helpful and be instrumental in increasing the cooperation and service of the pharmacist to the allied medical professions This information is to appear periodically throughout each year and some method be devised so that all pharmacists may be privileged to take advantage of such a pharmaceutical service

The following officers were elected for the 1936 Section on Education and Legislation
Chairman, C Leonard O Connell, *Vice Chairman* George C Schicks, *Secretary*, George A Moulton, *Delegate to the House of Delegates* L W Rising

(Signed) GEORGE C SCHICKS, *Delegate*

(See report of the Committee on Resolutions page 711)

The report of the Section on Practical Pharmacy and Dispensing was presented by Ralph W Clark

The Chairman's address was given the Secretary's report read and the papers presented The following recommendations were approved

Recommendations from Chairman's Address

1 The Chairman of the Committee on Glass Standardization previously requested that this Committee be discontinued but the Section overruled the recommendation Since he repeats this request I recommend that the Committee be discontinued unless recent developments have arisen which warrant its continuation

2 I recommend the continuation of the Committee for the collection of information pertaining to professional pharmacy and that the Council be requested to appropriate \$75 00 to carry on this work '

Recommendations made by the Committee for the collection of information pertaining to Professional Pharmacy

1 This Section, in cooperation with the Section on Education and Legislation, or the ASSOCIATION should foster a vigorous program to find out wherein the education of pharmacists is lax in respect to the attainment of professional ideals thereby endeavoring to uplift the dignity of pharmacy as a profession

2 The Section or the ASSOCIATION should make a survey as to the number of hospitals employing registered pharmacists as compared with those that employ more

3 The ASSOCIATION should endeavor to enlist the many hospital pharmacists in this country to join the A P H A as these men are the first to actually contact the young physician after they graduate

4 The Section or the ASSOCIATION should encourage hospital pharmacists to conduct dignified, scientific laboratories offering every assistance in the way of consultation, research etc, instead of conducting just a 'Pill Dispensing' storeroom

5 The ASSOCIATION should endeavor to correlate and supply authoritative information that will be of aid to local and state associations in promoting the use of official products

(Signed) RALPH W CLARK *Delegate*

The report of the Conference of Pharmaceutical Association Secretaries was presented by Charles J Clayton

The Conference of Pharmaceutical Association Secretaries held two sessions (Wednesday afternoon and Friday morning) both presided over by President F V McCullough of Indiana

In the absence of Secretary Carl G A Harring, of Massachusetts J Lester Hayman, of West Virginia acted in that capacity

Sixteen states were represented by the Secretaries of their respective associations

In addition to the two sessions previously mentioned, there was also held on Thursday

evening, a joint session of the Section on Education and Legislation, the Conference of Law Enforcement Officials and the Conference of Secretaries

At the Final Session, the following officers were elected

President, John Slocum, Iowa, *First Vice President*, Roy S Warnack, California, *Second Vice President*, Wm B Day, Illinois, *Secretary-Treasurer*, Carl G A Harring, Massachusetts

Executive Committee The four elected officers and F V McCullough, Indiana, R C Wilson, Georgia, J Lester Hayman, West Virginia, Jennings Murphy, Wisconsin, A L I Winne Virginia *Delegate to the House of Delegates*, Charles J Clayton, Colorado

(Signed) CHARLES J CLAYTON

The reports of the Committee on State Codes and of the Committee on Code Matters were called for

Secretary E F Kelly stated that because of the decision of the Supreme Court having discontinued the Drug Code, no report would be made He recommended that and asked that the report be considered as received and the committee be discontinued

No report was received from the Committee on Professional Relations

The report of the Committee on Resolutions was called for Chairman R L Swan thanked the members of the Committee

The report of the Committee on Resolutions is printed on pages 708 to 715 of the August Journal A Ph A

In order to avoid duplication in printing only Recommendation No 1 is reprinted An addition was made to the Committee report on Recommendation No 9—matter in brackets at end—EDITOR

Recommendation No 1

It is recommended that it shall be the policy of the AMERICAN PHARMACEUTICAL ASSOCIATION to require its full-time officers to confine their pharmaceutical activities to the affairs of the ASSOCIATION This is not to be interpreted as an abridgment of the privilege to take part in related affairs in the capacity of advisor, committeeman or delegate It is, however, to be interpreted as abridging the privilege of serving in a secretarial or managerial capacity to any other organization or group or to act as the spokesman or representative of any other organization or group within the sphere of pharmaceutical activity unless permission to do so is specifically granted by the Council

The Committee is sympathetic with the principle of this recommendation in the President's Address but feels that the purpose can be fully effectuated by referring it to the Council for further study and for whatever action it deems to be in the best interest of the ASSOCIATION

After the reading of Recommendation No 1 and of the Committee's report, President Fischels moved that the President's recommendation be substituted for that of the Committee, this motion was seconded by W J Husa It was discussed by Robert P Fischels W J Husa and others A *viva voce* vote was taken A roll call was requested and W J Husa was asked to check the delegates with the secretary, the vote was tabulated by Chairman Rowland Jones and Chairman R L Swan of the Committee Roll Call showed 25 in favor of the substitute motion and 18 against the secretary not voting Recommendations of the president up to No 8, inclusive, as submitted by the Committee were adopted

No 9 was referred to the Council the secretary of the National Association of the Boards of Pharmacy and the secretary of the American Association of Colleges of Pharmacy President Fischels moved an amendment, that the Council on Pharmaceutical Practice of the ASSOCIATION be included The amendment was carried

The Recommendations 10 to 17, inclusive were adopted

Recommendation on Resolutions of the New York Branch was approved and referred to Council, Recommendation on Local Branches was referred to Council Recommendations on Weights and Measures, Section on Education and Legislation Section on Historical Pharmacy were adopted the one on publications of the latter was disapproved The resolution of R L Irazary and the one relating to the American Association for the Advancement of Science were adopted The resolution from Indiana Pharmaceutical Association and the one submitted by the Section on Education and Legislation were approved and referred to Council All other recommendations of the Committee on Resolutions were adopted as presented

The report of the Committee as a whole was then approved

There being no Unfinished Business, Chairman Rowland Jones installed Roy Bird Cook as *Chairman* of the House of Delegates, and C. Thurston Gilbert as *Vice Chairman* who responded with thanks for the honor conferred

The session of the House of Delegates was then adjourned

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and Branches shall become the property of the Association with the understanding that they are not to be published in any other publication prior to their publication in those of the Association, except with the consent of the Council"—Part of Chapter VI, Article VI of the By Laws

ARTICLE III of Chapter VII reads "The objects and aims of local branches of this Association shall be the same as set forth in ARTICLE I of the Constitution of this body, and the acts of local branches shall in no way commit or bind this Association, and can only serve as recommendations to it" And no local branch shall enact any article of Constitution or By-Law to conflict with the Constitution or By Laws of this Association "

ARTICLE IV of Chapter VII reads "Each local branch having not less than 50 dues paid members of the Association, holding not less than six meetings annually with an attendance of not less than 9 members at each meeting, and the proceedings of which shall have been submitted to the JOURNAL for publication, may elect one representative to the House of Delegates "

Reports of the meeting of the Local Branches shall be mailed to the Editor on the day following the meeting, if possible. Minutes should be typewritten with wide spaces between the lines. Care should be taken to give proper names correctly and manuscript should be signed by the reporter. *Please advise us of changes in Roster and mail reports promptly*

PHILADELPHIA

The regular monthly meeting of the Philadelphia Branch, AMERICAN PHARMACEUTICAL ASSOCIATION, was held Tuesday night October 8, 1935, at 8 15 P M at the Philadelphia College of Pharmacy and Science. E. H. MacLaughlin presiding.

The minutes of the last meeting were read and approved.

Dr. James C. Munch, chairman of the membership committee, presented the name of John Zinsser, recently elected president of Sharp & Dohme for membership. Mr. Zinsser was unanimously elected to membership in the Local Branch.

The speaker of the evening, Prof. E. Fuller ton Cook, chairman of the Revision Committee U S P XI was then introduced. His topic was "The New Features of the Revised Pharmacopoeia." The speaker began his most interesting dissertation with a review of the history of the U S P and then proceeded in a masterful fashion to explain the organization set up and functions of the Revision Committee and the way it carried on business. He discussed certain pertinent changes in titles in the U S P XI as well as certain additions and deletions. Changes in requirements for stor-

age and preservation were delineated—this brought forth discussions from the floor.

The Local Branch was indeed fortunate in having the chairman of the Revision Committee discuss the U S P XI, for no one is more able to do this than Professor Cook. We can now more fully appreciate the tremendous amount of research and revision work necessary and certainly each and every pharmacist in the United States should feel proud that the Revision Committee is in such capable hands.

A rising vote of thanks was given the speaker for the information presented.

GEORGE E. BYERS, *Secretary*

CHICAGO

The first fall meeting of the Chicago Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held Tuesday evening October 22nd at the University of Illinois College of Pharmacy.

The speakers of the evening were Samuel Shkolni, who discussed "Current Topics at the Recent N A R D Convention in Cincinnati" and Lawrence Templeton, told of "The A P H A Convention in Portland" and Pharmacy Salmon and Cascara in Oregon."

A diversified and interesting discussion followed.

THE REMINGTON MEDAL AWARD

At the April 8, 1918, meeting of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION, a special committee made a report, adopted by the Branch and later by the Council of the A. P. H. A., which resulted in the establishment of the Remington Honor Medal. The suggestion leading to the provision was made by Hugo H. Schaefer and he has ever since directed the activities of the committee in charge of the annual award. The recommendations for the award are worded as follows:

That a gold medal to be known as the Joseph P. Remington medal and suitably engraved to be awarded to the man or woman who has done most for American Pharmacy during the preceding year where the result of these efforts would be considered as being the most important and advantageous for American Pharmacy. That no bar be placed as to the candidate's profession or kind of work accomplished.

That the medal be awarded by a standing committee consisting of all the past-presidents of the AMERICAN PHARMACEUTICAL ASSOCIATION, and in case the number of living past-presidents is less than five, the senior past vice-presidents of the ASSOCIATION be drawn upon in sufficient number to create a committee of five.

The secretary of the New York Branch is to act as secretary of this standing committee, the medal is to be presented by the Senior Past President of the Branch or in case of inability by other past presidents in the order of their seniority.

SAMUEL L. HILTON—THE 15TH REMINGTON MEDALIST

Samuel L. Hilton
Remington Medalist

Inscription on Remington
Medal

Joseph P. Remington—Face
of Medal

The Testimonial Dinner and the award of the Remington Medal was an outstanding function at the Mayflower Hotel, Washington, D. C.—under the auspices of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION, the District of Columbia Pharmaceutical Association, District of Columbia Board of Pharmacy, District of Columbia Veteran Druggists' Association, Faculty, George Washington School of Pharmacy—October 19, 1935. Augustus C. Taylor, *Chairman*.

More than 200 guests were in attendance, including members of the ASSOCIATION, of the National Association of Retail Druggists, of the Ladies Auxiliary, of local bodies, of the Reciprocity Club, relatives and friends. Hundreds of letters and messages evidenced the esteem in which the medalist is held. Mrs. Hilton was presented with beautiful flowers, and decorations added to the splendor of the reception and banquet room. Besides the District of Columbia, New York, Pennsylvania, Delaware, Maryland, New Jersey, Massachusetts, Virginia and, probably, other states were represented and few, if any, states were missing among those who sent congratulations. The toastmaster, R. L. Swan, performed his duty interestingly and expeditiously and did not take the time of the speakers. Among the latter were Dr. Elmer Louis Kayser, dean of the Students of George Washington University and Head of the Department of History, Dr. C. W. Ballard, president of New York Branch, A. P. H. A., Dr. Harry A. Fowler, past-president of the Medical Society of the District of Columbia, Prof. E. Fullerton Cook, chairman of the Revision Committee, United States Pharmacopoeia, Dean Theodore J. Bradley, of Massachusetts.

College of Pharmacy, Secretary E F Kelly, of the AMERICAN PHARMACEUTICAL ASSOCIATION Dean H V Army, Columbia University College of Pharmacy, and Mrs S L Hilton who graciously acknowledged flowers and the words of greeting There were songs by Carson P Fraley and Miss Agnes Fealy and accompaniments by Mrs A C Taylor

Having given an outline of the delightful function, a few words from each of the addresses, including that of the recipient of the medal, follow

Dr Kayser referred to the high regard in which Dr Hilton is held and the valuation placed on the information given the pharmacy students

Dr Ballard explained the procedure in the medal award and the pleasure of New York Branch in making the presentation

Dr Fowler spoke of his relation with the well and favorably known pharmacist and the information received on many occasions from him The major portion of the address dealt with the important part of pharmacy in the progress of medicine

Professor Cook discussed the work involved in pharmacopœial revision and the devotion to and unselfish contributions made during many years by Dr Hilton without fear or favor so that the best results may be obtained and referred to improvements which resulted from his suggestions

Dean Bradley introduced his remarks by a number of well told stories, a happy faculty which marks him as a speaker on occasions of this kind He then referred to the guest of honor as one who is ever ready to render unselfish service without thought of personal favor, and spoke of many years of friendship and mutual association activities

Secretary Kelly interspersed his remarks with a story here and there He referred to the many years of acquaintance, the sterling qualities which contributed largely to the success of the building project and credited the medalist with the performance of essentials that resulted in the beautiful structure His efforts on a number of occasions cleared situations that required the guidance of one who knew of relations that existed and of one who had contacts, developed through years of acquaintance, and possessed information relative to civic and governmental affairs When the time came that work could be started on the foundation of the building the knowledge possessed by Sam Hilton," who as a lad played in this section on the very grounds now occupied by the INSTITUTE OF PHARMACY was of great value From the time that the first stone was placed, day by day as the structure took shape, this enthusiast visited the site Of no other person can it be said that he has as intimate an acquaintance of the location ground sand mortar stone and equipment as the guest of honor On later occasions, when it became necessary to adjust other matters it was again the information and acquaintance possessed by him which were essentially helpful

Carson P Fraley paid tribute by his words in the song, 'Friend of Mine' A like appreciation (friend of mine) was given by members of the Reciprocity Club represented as a body on this occasion

The presentation of the medal was made by Dr H V Army who referred to the quality of service rendered by the recipient of the medal which it was his pleasure to present He considered this a great honor and congratulated him as a faithful member and the ASSOCIATION upon so worthy a son of American Pharmacy

ABSTRACT OF REMARKS BY THE MEDALIST

After impromptu appreciative references to the toastmaster and the speakers of the evening the recipient greeted them the members of the Committee of the New York Branch and other participating organizations

In his introductory remarks he acknowledged the honor of being deemed worthy of the award and extended thanks and referred to the thought which resulted in the memorial to a leading American pharmacist and the plan by which it is perpetuated

Continuing, he spoke of his early acquaintance with Professor Remington, in 1890, and the friendship formed was strengthened on the journey with him and other distinguished pharmacists to New Orleans in 1891 when he attended the first meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION He referred to a conference on pharmacopœial matters in Washington when the hours of the delightful evening ended at 4 o'clock in the morning

On many occasions thereafter it was his pleasure to be with Professor Remington—in the

class room, in the home and the annual meetings of the ASSOCIATION. He spoke of Remington's outstanding qualities of leadership and happy conversation, his ability to adjust difficulties and promote successful organization work, whereby improvements were made effective by the ASSOCIATION. He spoke favorably of his chairmanship in pharmacopœial revision and authorship. In concluding his remarks the medalist referred to his happiness as a result of work and again expressed thanks and appreciation for the honor conferred.

Moments of visitations among friends closed the evening's ceremonies.

PHARMACY AND THE PUBLIC HEALTH

BY ROBERT P. FISCHELIS

Lateness in the month prevents extended reference to the timely Radio address ushering in Pharmacy Week by former president, Robert P. Fischelis, of the AMERICAN PHARMACEUTICAL ASSOCIATION delivered from station WEAJ, New York, over the Red Network of the National Broadcasting Co., on Saturday evening, October 19th 7:45-8:00 P.M.

Reference to an article by a prominent physician writing in one of the national magazines, in which he referred to Pharmacy as 'a vanishing profession,' served in part as a text. Rather than not do justice in making brief abstracts the concluding remarks of the address only are quoted.

In the observance of National Pharmacy Week, October 20th to 26th, the professional pharmacists of America will again demonstrate to the public through displays in their shop windows that they are keeping alive the best traditions of the medical profession in all its branches. It is significant that during the past year the two annual awards for outstanding achievement in pharmacy have been made on the basis of activities involving retail pharmacists. The Ebert Prize which is annually awarded by the AMERICAN PHARMACEUTICAL ASSOCIATION for scientific achievement was given to Professor Andrews of the University of Maryland for his researches on methods of improving the accuracy of prescription compounding. The Remington Honor Medal awarded annually by the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION to the person, who in the opinion of the majority of ex-presidents of the ASSOCIATION, has done most for American Pharmacy in the preceding year or over a period of years, is being awarded to night in the City of Washington to Samuel L. Hilton, a practicing retail pharmacist of that City for activities connected with the erection of the beautiful headquarters building of the AMERICAN PHARMACEUTICAL ASSOCIATION.

"One hundred and thirty thousand registered pharmacists in nearly sixty thousand retail drug stores of the United States are thus encouraged to carry on. They believe that pharmacy is not a vanishing profession."

INTELLIGENT SERVICE

Progress, development and service are the watchwords of any science or profession and pharmacy must and is doing its share in advancing the general health sciences. The corner drug store is open about 18 hours out of the 24 and the druggist is on call at all hours to supply needed medicines to the sick. The purpose of his training is not the selling of merchandise as that is secondary but to intelligently serve his community when medicinal supplies are needed.—C. B. JORDAN

WHO SPEAKS FOR AMERICAN PHARMACY?

This question is asked repeatedly in the halls of our National and State Legislatures. It is asked by the heads of Governmental Bureaus—both national and state. It is being asked with increasing frequency by members of other professions engaged in providing medical care. It is a question which has become of more than passing interest to the public and it is a question which in the light of recent developments pharmacists are asking themselves, because there is a growing suspicion that what should be the right answer to the question does not coincide with the facts as we find them.—Dr. Robert P. Fischelis in an address at the annual meeting of the National Association of Retail Druggists, Cincinnati.

EDITORIAL NOTES

RED CROSS ROLL CALL

Red Cross service is as wide as humanity's ills, meeting all manner of distress on the basis of individual and community need. Its two-fold programs of cure and prevention range in scope from the ministering to victims of disasters to teaching how to bandage a cut finger. There is scarcely a situation of human suffering which the Red Cross is not called upon to meet.

Even a volunteer organization such as the Red Cross must have funds with which to carry on and these are provided by the four million men and women who annually join the Red Cross and whose membership dues support its activities.

Join at Roll Call November 11th-28th

AN APPRECIATION

THE PHARMACY EXHIBIT at the 1933 34 Century of Progress Exposition at Chicago, which was conceived and developed by the committee appointed for this work, has shown the development of American Pharmacy to millions of people from every part of the world. This scroll is presented by the AMERICAN PHARMACEUTICAL ASSOCIATION as a token of appreciation to

Reduced etching of scroll presented to H C Christensen, Julius Riemenschneider, and Frank A Kirby. See page 817 September JOURNAL A PH A.

RECOGNITION OF OUTSTANDING SERVICES FOR PHARMACY AT CENTURY OF PROGRESS EXHIBITION

The AMERICAN PHARMACEUTICAL ASSOCIATION expressed its appreciation by individual scrolls to H C Christensen, Julius Riemenschneider and Dr Frank B Kirby for their valuable services in connection with the work represented by the Pharmacy Exhibit at the Century of Progress Exposition, Chicago.

Miss Esther H Barney served with distinction in superintending the exhibit and Thad-

deus Niemiec was in charge of the pharmaceutical dispensing. A copy of the scroll presented to Miss Barney is shown in the *C R D A News* for October 5th, page 56. The scroll awarded to her is signed by the Local Committee H C Christensen, Julius Riemenschneider and Frank B Kirby and by President R L Swain and Secretary E F Kelly of the AMERICAN PHARMACEUTICAL ASSOCIATION. The same applies to the scroll of Thaddeus Niemiec.

THE BADIANUS MANUSCRIPT

The Magazine Section of the *Washington Post* October 13th, features an article on Strange Discovery—First Book of Plant

Science" by Dr Frank Thone. Dr Emily Walcott Emmart contributed an interesting paper to the Section on Historical Pharmacy A PH A on the subject, printed in the JOURNAL, A PH A for September, pages 771-774. Since then Dr Emmart has visited the Vatican Library, examined the book and was granted permission to photograph it. The manuscript

is 6 by $8\frac{1}{4}$ inches, bound in crimson velvet, it is clearly written in Latin and Aztec. The text is exquisitely illustrated with pictures which retain their brilliancy of color, these have been copied in water color sketches, through the kindness of Dr Charles G Abbott, of the Smithsonian Institution. A half tone from the photograph mentioned is shown herewith.

NEWER PRESERVATIVES USED IN PHARMACY

Most of the early work in the esters of *p* hydroxybenzoic acid was summarized by S Bach (*P J*, 128, 328 (1932)). Later, H Burlinson (*Quart J Pharm Pharmacol*, 7, 489 (1934)) found the propyl and ethyl esters to be efficient for the preservation of mucilage of tragacanth. The propyl derivative in a concentration of 0.05 per cent appeared to be the best preservative for the mucilage. The author has found that a 1 per cent w/v solution of tartaric acid in water in which ordinarily a mold appeared within twenty four hours may be preserved by the addition of 0.05 per cent of methyl *p* hydroxybenzoate or 0.01 per cent of propyl *p* hydroxybenzoate. In the case of fresh infusion of calumba while 10 per cent of alcohol (90 per cent) effectively preserved it, 0.15 per cent of methyl *p* hydroxybenzoate preserved it for four days only, while the propyl ester had practically no preservative effect in strengths up to 0.075 per cent.—E E NYE (*Austral J Pharm* 590 183 (1935), through *The Pharmaceutical Journal* of July 6, 1935).

ASSESSING ABILITY TO PAY

Physicians, dentists, pharmacists, members of hospital staffs and nurses of Omaha and county will be included among the members of the Omaha, Douglas County Central Health Service Association which will seek to reduce the charity rolls. Each low income patient will be questioned regarding his or her ability to pay—then a card will be given stating the ability to pay—one fourth, one-half or whatever portion is determined. When the patient visits the doctor a card conforming to schedule is presented and the physician charges the proportion designated. Similar procedure follows in prescription service.

KENTUCKY U S P EXHIBIT

The *Journal of Kentucky Pharmaceutical Association* for October carries on its cover a

print of the U S P Exhibit made at the annual meeting of the Kentucky State Medical Association, sponsored by this organization, the Kentucky State Pharmaceutical Association, Jefferson County Medical Society and Louisville Retail Druggists' Association. Along with the display, cooperative publicity material was distributed which gave information relative to U S P chemicals and proprietary products, preparations of the Pharmacopoeia and those known under proprietary designations.

The display and cooperation are helpful evidence in the interest of public health and better professional service.

THE YEAR BOOK AND MONTHLY ABSTRACTS

The *Rocky Mountain Druggist*, for October 1935, gives an interesting outline of the subjects considered in the YEAR BOOK for 1933 and comments favorably on this work as well as the publication of the monthly abstracts of pharmaceutical literature which have appeared in the JOURNAL of the A P H A since the March issue.

In closing the review the *Rocky Mountain Druggist* states the publication of "Pharmaceutical Abstracts" will make available each month a comprehensive review of literature for retailers, wholesalers, manufacturers, teachers, editors, research workers and all others connected with the profession and industry of pharmacy and marks another step in the enlarged service which the ASSOCIATION plans for all who are interested in professional and industrial pharmacy.

Appreciation is expressed for the detailed comment.

The October Pharmacy Week" issue of the *Druggists' Circular* may be designated a work of art, brilliantly conceived and executed, containing also timely articles by Dr Charles H Mayo, of the Mayo Clinic, Rochester, Minn., Dr Lloyd K Riggs, director of research and Prof George C Schucks, of Rutgers University College of Pharmacy, Dr H A B Dunning and others.

A prominent feature of the issue is the five page section of photographs of the AMERICAN INSTITUTE OF PHARMACY, Washington, taken specially for the publication by Underwood & Underwood.

INFANTILE PARALYSIS SERUM

A serum, said by Dr E C Rosenow of the Mayo Foundation to be effective in the treat-

ment of infantile paralysis, was demonstrated in Louisville before members of the Kentucky State Medical Association. A conference was convened in San Diego, called by President Roosevelt to make Nation wide plans to eradicate infantile paralysis and to promote measures designed to lessen the handicap of those who have been crippled by the dread disease. The work outlined is to be under the Warm Springs Foundation.

Infantile paralysis has never attained the epidemic proportions of the plagues which ravaged civilization in earlier periods but when it is considered that 75 per cent of the 17 000 patients admitted to one of the Scottish Rite Hospitals for Crippled Children have suffered from disease or deformity originating in the infantile paralysis it becomes everybody's responsibility because no one is free from the attack, or members of the family may be stricken.

PERSONAL AND NEWS ITEMS

Preston Dunn, druggist of Eskridge, Kans., has been elected commander of the Kansas department of the American Legion. He is a former mayor of Eskridge.

Hans Heger's 80th birthday was celebrated by the Austrian Pharmaceutical Society, of which he is the secretary. He is also active in an editorial capacity of the official Austrian pharmaceutical publications. Congratulations are extended and best wishes for continued health.

President A C Taylor, of the District of Columbia Pharmaceutical Association warns pharmacists to be careful relative to returns under the law requiring payment of tax on cosmetics and toilet preparations. He refers particularly, in this instance, to rose water and glycerine.

Dean A. Richard Bliss, Jr, of the School of Pharmacy of Howard College of Birmingham Alabama, represented Columbia University at the inauguration of Doctor Alfred Benjamin Butts as Chancellor of the University of Mississippi on October 19th.

Dr C H Searle advises that a research fellowship has been established at the State University of Iowa under the supervision of Dr Henry Gilman professor of Organic Chemistry, and another fellowship at the University of California Medical School under the supervision of Dr C D Lake professor of Pharmacology.

Dr Francisco Cignoli, of Buenos Aires, has favored us with a reprint on National Formularies. The writer is much interested in the JOURNAL OF THE A P H A. The reprint is in Spanish, the following formularies are discussed from an historical and present viewpoint. The National Formulary, American, Brazil, Germany (Erganzungsbuch), Great Britain (The Pharmaceutical Codex), France, "Formulaire Generale des Pharmaciens Francais," Belgium Formulaire National. Military and hospital formularies also receive attention.

J A Reese has been appointed to a graduate fellowship at the University of Florida.

T D Rowe, of the University of Montana, succeeds J A Reese at the School of Pharmacy Medical College of Virginia.

Dr R Eder, Institute of Pharmacy, Zurich Switzerland, contemplates making a visit to the United States. He hopes to be in this country about the middle of November.

The Evening Sun (Baltimore) of October 1st speaks editorially of Sir Henry Wellcome in connection with the medal associated with his name and awarded for valuable military service. The medal has recently been awarded to Major Leon A Fox U S A, attached to the 104th Medical Regiment.

Radio talks by Frederick J Wulling, dean of the College of Pharmacy, University of Minnesota are delivered each Wednesday over WLB, 1 00 to 1 15 P M from October 23rd to November 27th inclusive, on the following subjects: Pharmacy Week Anniversary, Pharmacy and the Public.

Famous Discoveries by Pharmacists, "Medicines Obtained from Animals," "Medicines Obtained from Bacteria" and "Drugs Mentioned in the Bible."

Abstracts of Scientific Literature have been prepared by the staff of the Library of E R Squibb & Sons. Miss E Pickering, Director, contributed through the courtesy of F W Nitardy and published under the auspices of the U S P Board of Trustees.

PHARMACY WEEK IN THE DAILY PRESS

The interest in pharmacy has been evidenced in the Press by editorials and most of the articles coming to our attention have expressed a helpful purpose to promote professional pharmacy. Every day during Pharmacy week these editorials have appeared emphasizing that the annual occasion is worthy of public attention and that "the present trend is to

make the prescription department the heart of the store, with ware and apparatus accurate, immaculate and aseptic "

MONTANA EARTHQUAKES

A property loss of several million dollars on October 19th was reported from earthquakes and fire damages. Several deaths and many injuries were reported, the American Red Cross is active and helpful, and Helena officials soon had the situation well in hand

FUNCTION OF MUSEUMS

Museums may be storehouses, but little else, the collecting, labeling and arrangement seem to be the only reasons for their establishment. A museum's existence should be justified by the extent to which it gives information and understanding. A museum should have a purpose to serve the students of the subject which is displayed.

OBITUARY

L E HIGHLEY

L E Highley, one of the pioneer pharmacists of South Dakota—member of the AMERICAN PHARMACEUTICAL ASSOCIATION since 1913—died September 16th in Rochester, Minn., following an illness of several weeks.

Mr Highley was born in Storm Lake, Iowa, March 13, 1876. With his parents he moved on February 14, 1887, to Whitewood, S D., where he received his grade school education. He was graduated from the pharmacy department of the State University of Iowa on March 17, 1897.

For thirty-five years Mr Highley had been in the drug business in Hot Springs, and during that time took a prominent part in helping to shape the development of the city. He was a member of the Masonic lodge, the Kiwanis club and the Chamber of Commerce. He served three terms in the South Dakota state senate in the years, 1909, 1928 and 1930 and contributed largely to the passage of South Dakota pharmacy laws.

Mr Highley was serving his fourth term as mayor of Hot Springs and it was in large measure his careful attention that has placed its affairs on a sound financial basis.

Besides his wife, Mr Highley is survived by three brothers, George, Edgemont, William, Whitewood, Elmer, San Francisco.

WALTER TREAT WALKER

Walter Treat Walker, Vice President In-Charge-of-Sales of the Kimble Glass Company of Vineland, N J., died suddenly at White Sulphur Springs, West Virginia, Wednesday evening October 2nd. Mr Walker was fifty-two years of age, a graduate of the Sheffield Scientific School of Yale University and a member of the Yale Club of New York.

City, and the Penn Athletic Club of Philadelphia. He was also a charter member of the American Legion, having served in the Air Section of the United States Signal Corps with the rank of Captain. He is survived by his widow, Mrs Kate Walker, and his eight-year-old son, William.

DR CARL DUISBERG

The death is announced of Dr Carl Duisberg at the age of 73. Dr Duisberg was the founder and president of the German Dye Trust and the inventor of aspirin. He joined the staff of the Laboratory Elberfeld Dye Factories of Fr Bayer and Co when he was 21, and ultimately he became the company's managing director. When the leading dye factories were fused into I G Farbenindustrie A G he became chairman of the Supervisory Board and of the Administrative Council of the firm. Among the many important positions he held were chairman of the Reich Federation of German Industry, member of the Reich Health Bureau and Cologne Railway Council and member of the Prussian Academy of Science.

HENRY C BIDDLE

The death is announced of Dr Henry Chalmers Biddle, former dean of the College of Pharmacy of the University of California, aged 65 years. His activities included those of author, clergyman and educator. From 1901 to 1918 he taught in Monmouth College and the University of Chicago, for a period he was acting professor in Temple University, Philadelphia. He was lecturer in San Francisco State Teachers' College from 1922 to 1931 and professor of chemistry in the University of California School of Pharmacy, and was elected dean of the institution in 1926, retiring in 1932.

SOCIETIES AND COLLEGES

BALTIMORE

The October meeting of Baltimore Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION will be held on the 31st at Emerson Hotel. The speaker of the evening will be Dr David M R Culbreth, Emeritus Professor of Materia Medica, School of Pharmacy, University of Maryland, elected *Honorary President* of the AMERICAN PHARMACEUTICAL ASSOCIATION. His subject will be 'How can a person be satisfied and contented while making a living and a reserve for old age in the retail drug business?' A function of the evening will be the presentation of the Ebert Prize Award to Marvin J Andrews by Secretary E F Kelly, A PH A

C JELLEFF CARR *Secretary-Treasurer*

MEETING OF THE AMERICAN
ASSOCIATION FOR THE ADVANCE-
MENT OF SCIENCE

The ninety fifth meeting of the American Association for the Advancement of Science, together with scientific organizations associated with it, will convene in Pittsburgh during the Christmas holidays. The meetings begin on Thursday evening, December 27th, when the city and the institutions of Pittsburgh will extend an official welcome to their guests in the Carnegie Music Hall. Prof E L Thorndike, the distinguished psychologist president of the Association, in a brief address will respond for the visitors. A reception tendered by the Pittsburgh Local Committee will follow.

STATE BOARD REQUIREMENTS

Secretary H C Christensen has revised state board requirements for entrance to Registered Pharmacist examination. He is making the charts available and points out that pharmacy has taken rapid strides toward higher standards. A study of the chart shows that the four year college course with one year of retail experience is now prevailing in most states. Only five states are without provision for compulsory college training. We hope to publish the chart later and in the meantime the information can be obtained from the Secretary 130 North Wells St, Chicago, Ill

WEST VIRGINIA STATE OFFICERS

The following officers were elected by mail

ballot by West Virginia Pharmaceutical Association

President, E O Wiseman Fayetteville, *First Vice President* James A Patterson, Martinsburg, *Second Vice President*, W S Coleman, Lewisburg, *Third Vice President*, Fred A McFarlin, Clarksburg *Secretary Treasurer*, J Lester Hayman, Morgantown *Council Member*, Marlinton. These officers will be installed next June at White Sulphur Springs

GIFT TO MEDICAL COLLEGE OF
VIRGINIA

Through an anonymous gift of \$300,000 00 and a federal grant of \$239 850 00 an out patient clinic building with associated medical laboratories, which has been planned by the institution for several years, will shortly go under construction. The building will be seven stories in height the four lower floors to be assigned to clinics, the upper floors for teaching laboratories in pathology bacteriology biochemistry, public health and preventive medicine

RHO CHI SOCIETY

The annual convention of Rho Chi Society was held at the Hotel Multnomah Portland, Oregon on Wednesday August 7, 1935. There were approximately one hundred members and guests present at the banquet, at which Dean R A Lyman, of the School of Pharmacy University of Nebraska, was the speaker. L W Rising University of Washington, was installed as the new *National Treasurer*, and Loyd E Harris as *National Secretary*. F J Bacon and H M Burlage continue as *National President* and *National Vice President*, respectively, for another year. Glenn L Jenkins University of Maryland and Elmer H Wirth, University of Illinois were elected as members of the *Executive Council* for a period of two years.

Loyd E HARRIS, *National Secretary*

VETERANS OF THE CHICAGO AND
MILWAUKEE ASSOCIATIONS MEET

Veterans of the Milwaukee and Chicago Associations met on October 17th, at Bismarck Hotel Chicago. This was an exchange visit the last meeting having been held in Milwaukee. The presidents of the two organizations presided.

Communications were read from Governor Horner and from F W Meissner of La Porte, Indiana. The details of the successful meeting were arranged by Secretaries Von Hermann and Mrazek.

CHICAGO MEDICAL SOCIETY

The Chicago Medical Society is continuing its work on the U S P and N F. A meeting of the committee was held on October 8th. Dr J J Gill and Dr Bernard Pantus were re-appointed on the Committee and Dr Otto S Pavlick was appointed as a new member. All of them have had pharmaceutical experience and have contributed largely to therapeutics.

DELAWARE PHARMACEUTICAL SOCIETY ISSUES MONTHLY BULLETINS

Delaware Pharmaceutical Society is issuing a monthly bulletin of information. It is contemplated to discuss a wide variety of subjects—laws and regulations, proposed legislation, professional pharmacy, trade practices, etc. The secretary of the Society is Albert Bunn, 1713 W 4th Street, Wilmington.

HOSPITAL PHARMACY

The Western New York Hospital Council, an organization composed of hospital executives at its October meeting devoted its program to pharmaceutical problems. Three well-prepared papers were presented by hospital pharmacists on the subjects 'Pharmaceutical Economics,' and 'The Preparation and Chemistry of Surgical Solutions.'

IDAHO STATE PHARMACEUTICAL ASSOCIATION BULLETIN

Idaho State Pharmaceutical Association Bulletin for October 15th has an interesting account of the meeting of AMERICAN PHARMACEUTICAL ASSOCIATION by Dean E O Leonard. This issue also contains much of interest for Idaho druggists and part of the resolutions adopted by the National Association of Retail Druggists.

PHARMACY RECOGNIZED LEGALLY AS A PROFESSION IN CALIFORNIA

The Supreme Court of California has ruled that the statute prohibiting aliens from registering as pharmacists as applied to Japanese is not invalid as conflicting with the treaty extending to Japanese citizens the right to carry

on trade or to own shop as if they were citizens of the United States, since the practice of pharmacy is a profession and not a trade (St 1933, p 2193, —2 3 Treaty of Commerce and Navigation between the United States and Japan Art 1, 37, Stat 1504) *Sashihara vs State Board of Pharmacy*—*Bulletin XXXI*, W Bruce Philip.

MEDICAL COLLEGE SCHOOL OF PHARMACY

Dean W F Rudd advises that the limit of one hundred students in the School of Pharmacy has been reached. Of the new matriculants sixteen had completed one or more years of academic college work, six have their Bachelors degrees and two their Masters and M D degrees.

OFFICERS OF THE NATIONAL WHOLESALE DRUGGISTS' ASSOCIATION

The following officers were elected by the National Wholesale Druggists' Association at the annual meeting, held at White Sulphur Springs, September 29th to October 4th: *President*, William J Schueffelin, Jr, New York, *First Vice-President*, George B Evans, Albany, N Y, *Second Vice-President*, E A Morrison, Meridian, Miss, *Third Vice-President*, W F Terry, San Francisco, Calif, *Fourth Vice-President*, H M Folsom, San Diego, Calif, *Fifth Vice President*, J O Robinson, Baltimore, Md.

Members of the Board of Control, J C O'Dell, Birmingham, Ala, S O Davidson, Kansas City, Mo, J B McCormick, Pittsburgh, Pa, and Arthur S Raymond, Lincoln, Neb.

John W Phillips, New Orleans, was elected *Honorary President* of the Association, and William A Hover, Long Beach, Calif, was elected to *honorary membership*.

The Association voted to hold its 1936 convention in the Greenbrier Hotel, White Sulphur Springs, not earlier than the first week in October.

Quoting the Oil, Paint and Drug Reporter "Enactment of legislation to clarify the provisions of Section 2 of the Clayton act with regard to discriminatory prices and such other legislation as may be necessary to aid in the elimination of unfair trade practices which seriously jeopardize the welfare of retail and wholesale druggists was favored by the National Wholesale Druggists' Association in a

resolution approved by its Board of Control and adopted at its sixty first annual convention. The resolution followed discussions of the subject by President A Kiefer Mayer, Secretary E L Newcomb, Robert F Vaughan, Association counsel under the NIRA and various committee chairmen.

The Association considered other legislative developments of the past year, such as the Wagner Labor Bill, the Social Security Act, and State fair trade laws, and took the position that, inasmuch as the constitutionality of much of this new legislation is seriously questioned by eminent legal authority, it should adopt a policy similar to that which it followed in respect to the NIRA.

The Association recorded itself as a proponent of the basic principles of the Nye-King bill and favored the principles involved in the Patman bill. It commended its proprietary goods committee for assistance given to manufacturers and distributors with respect to lawful operation under fair trade laws and urged that this work be continued. The Association reiterated its position with respect

to food and drug legislation which will adequately protect the public but not unnecessarily handicap the drug industry."

OFFICERS OF THE NATIONAL ASSOCIATION OF RETAIL DRUGGISTS

The officers elected for the ensuing year by the National Association of Retail Druggists are the following: *President*, Charles Ehlers Cincinnati, Ohio, *First Vice President*, Z V Kerrigan, St. Louis Mo., *Second Vice President*, Harvey L Wertley, Philadelphia Pa., *Third Vice President*, Walter H Varnum, Lawrence Kans., *Secretary*, John W Dargavel Chicago, Ill., *Treasurer*, H L Chichester, Macon, Ga. *Executive Committee, Chairman* Thomas S Smith, Wilmington, Del., *George L Second*, Chicago Ill., *Monte L Powell*, Denver Colo., *Harvey A Henry*, Los Angeles Cal., *John Witty* Portland, Ore., *Hugh P Berne* New Haven Conn. The *Editor* of the *N A R D Journal* is George A Bender and *Washington Representative*, Rowland Jones.

LEGAL AND LEGISLATIVE

Executive Officer A C Hill, Jr., has addressed former code authorities stating that in cases where the records and files of former Code Authorities are in danger of loss or destruction due to liquidation, or lack of facilities for storage, the custodians thereof should immediately contact the National Recovery Administration in order that it may arrange for proper storage. Confidential records will of course be preserved as such.

TEXAS LEGISLATURE PROVIDES FOR LICENSES

The Texas Legislature has provided license fees as follows: Upon one store the license fee shall be \$1 00, upon each additional store in excess of one and not to exceed two, the license fee shall be \$6 00, upon each additional store in excess of two but not to exceed five the license fee shall be \$25 00. Further assessments are fixed upon each additional store in excess of five and not to exceed ten, \$50 00, upon each additional store in excess of 10 but not to exceed 20 the license fee shall be \$150 00, up to 35, a \$250 00 license is assessed upon each additional store in excess of 35 but not to exceed 50, the license fee shall be \$500 00,

and for each additional store in excess of 50 the license fee shall be \$750 00.

LEGALIZING PRICE AGREEMENTS BY AMENDMENTS TO SECTIONS 1 AND 45, TITLE 15, U S CONGRESS

'Sec 1 Contracts in Restraint of Trade among States Illegal—Every contract, combination in the form of trust or otherwise or conspiracy, in restraint of trade or commerce among the several states, or with foreign nations is hereby declared to be illegal, *provided that nothing herein contained shall render illegal contracts or agreements prescribing minimum prices for the sale or resale of a commodity which bears or the label or container of which bears, the trade-mark, brand or name of the producer or owner of such commodity and which is in fair and open competition with commodities of the same general class produced by others, when such contracts or agreements are lawful under any statute now or hereafter in effect in any State, Territory or the District of Columbia in which such sale or resale is to be made and the making of such contracts or agreements shall not be an unfair method of competition under Section 45, Title 15 U S C* Every person who shall

make any contract, or engage in any combination or conspiracy declared to be illegal by this act, shall be deemed guilty of a misdemeanor and, on conviction thereof, shall be punished by fine not exceeding five thousand dollars or by imprisonment not exceeding one year, or by both said punishments, in the discretion of the court"—*Drug World*

PROPOSED NEW YORK HEALTH CODE CHANGES

The *Drug World* gives the following as the principal points in the proposed amendments to the New York City Sanitary Codes

'1 Every proprietary medicine or cosmetic sold in New York City shall be registered with the Board of Health at an initial annual cost of \$25.00 and renewal cost of \$10.00

'2 Products listed in the latest revision of the U. S. Pharmacopoeia or National Formulary are excepted. Also excepted are proprietaries each container of which bears the notice 'May not be sold except upon a doctor's prescription'

'3 A Certificate of Registration may be denied or revoked if a false or misleading statement is made in the application for registration, for false or misleading advertising, for a claim that a product is a cure, if the product contains poisons or dangerous substances in quantities to make it potentially harmful if the product contains alkaloid cocaine, alpha or beta eucaine, more alcohol than needed for solvent or preservative, or alcohol not sufficiently medicated to be unfit for beverage purposes, if it contains methyl alcohol more than lawful quantities of opium or any radio active ingredient, if a formula, name or label is changed without approval of the Board of Health

'4 The amendments shall become effective June 1, 1936, but shall not apply to stocks in the hands of persons other than manufacturers at that time

'5 Applications for registration shall give name of product, name and address of applicant (if applicant has no New York address, address of agent on whom papers can be served) place of manufacture and by whom, name or chemist or pharmacist in continuous supervision exact text of every judgment, decree or stipulation ever issued in connection with the product, therapeutic and other beneficial effects claimed exact form of label on retail package, all literature distributed in connection with the product exact text of all advertising material to be used in any manner

within the following three months a sworn statement of the quantitative and qualitative formula, a sample of the product and container'

WISCONSIN FAIR TRADE ACT IN COURT

A test case has been started in the circuit court at Milwaukee involving the Wisconsin Fair Trade Act. The plaintiff is the Wisconsin Wine & Spirit Importers Co. The defendant attacks the constitutionality of the Act on the grounds that it unlawfully attempts to legalize price fixing. The fair trade act became a law in Wisconsin several months ago. Wisconsin pharmacists originated agitation for the act and were prime movers in the formation of the Wisconsin Federation of Independent Associations which sponsored the bill.

VITAMIN C EASILY DESTROYED

In general vitamin C is the most easily destroyed of all the known vitamins, also it is easily soluble in water so that rejection of cooking water or the "water" of such canned vegetables as asparagus, peas or string beans may result in the loss of a large part of the vitamin C which had escaped destruction, and furthermore, fruits are often preserved prepared and eaten with such large amounts of added sugar that the vitamin value (and mineral content) is materially diluted and at the same time the consumption of actual fruit diminished because of the extent to which the sugar satiates the appetite.—SHERMAN, H. C. "Food and Health," New York: MacMillan Company, 1934 through *Journal A. M. A.*

BOOK NOTICES AND REVIEWS

Medicinal Plants of France—The Center for Technical and Economic Documentation on Medicinal and Aromatic Plants (formerly the National Office of Primary Vegetable Materials for the Perfumery and Drug Trades) continuing the work begun, has just published a new series of engravings, in color, of wild and cultivated medicinal plants, representing the first edition of the 3rd and last volume, the first two volumes containing two articles and 104 plates, representing the complete collection up to date. A few of these series are exhausted and will not be published again.

Due to its consistently perfect execution and its scientific and artistic value, this 13th Series will be appreciated just as much as the previous

series by every one interested in botany and *materna medica*. It will be of the same service to collectors and cultivators of medicinal and aromatic plants, and also useful in various kinds of studies. The 8 plates composing this 13th Series represent Black Mustard, White Mus-

tard and Field Mustard, Cerise Laurel and Common Laurel, Odoriferous Asperule and Garance, Chiendents (Dog Teeth), Petit Houx and Official Asparagus, Reglisse and Galega, Ricin (Castor), Grande Absinthe and Marine Absinthe.

NOTICE TO CONTRIBUTORS TO THE JOURNAL AMERICAN PHARMACEUTICAL ASSOCIATION

The following notice has been prepared from comments received from members of the Board of Review of Papers and of the Publication Committee.

Manuscripts should be sent to Editor E. G. Eberle, 2215 Constitution Ave., N. W., Washington, D. C.

All manuscripts should be typewritten in double spacing on one side of paper 8½ x 11 inches, and should be mailed in a flat package—not rolled. The original (*not* carbon) copy should be sent. The original drawings, not photographs of drawings, should accompany the manuscript. Authors should indicate on the manuscript the approximate position of text figures. All drawings should be marked with the author's name and address.

A condensed title running page headline, not to exceed thirty-five letters, should be given on a separate sheet and placed at the beginning of each article.

The method of stating the laboratory in which the work is done should be uniform and placed as a footnote at end of first page, giving Department, School or College. The date when received for publication should be given.

Numerals are used for figures for all definite weights, measurements, percentages, and degrees of temperature (for example 2 Kg., 1 inch, 20.5 cc., 300° C.). Spell out all indefinite and approximate periods of time and other numerals which are used in a general manner (for example one hundred years ago, about two and one-half hours, seven times).

Standard abbreviations should be used whenever weights and measures are given in the metric system, e. g., 10 Kg., 25 cc., etc. The forms to be used are cc., Kg., mg., mm., L. and M.

Figures should be numbered from 1 up, beginning with the text-figures (line engravings are always treated as text-figures and should be designated as such) and continuing through the plates. The reduction desired should be clearly indicated on the margin of the drawing. All drawings should be made with India ink, preferably on white tracing paper or cloth. If coordinate paper is used, a blue lined paper must be chosen. Usually it is desirable to ink in the large squares so that the curves can be more easily read. Lettering should be plain and large enough to reproduce well when the drawing is reduced to the width of a printed page (usually about 4 inches). Photographs intended for half tone reproduction should be securely mounted with colorless paste.

'Figure' should be spelled out at the beginning of a sentence, elsewhere it is abbreviated to 'Fig.', per cent.—2 words.

The expense for a limited number of figures and plates will be borne by the JOURNAL, except for cuts in excess of this number must be defrayed by the author.

References to the literature cited should be grouped at the end of the manuscript under the *References*. The citations should be numbered consecutively in the order of their appearance (their location in the text should be indicated by full sized figures included in parentheses). The sequence followed in the citations should be: Author's name (with initials), name of publication, volume number, page number and the date in parentheses. Abbreviations for journals should conform to the style of *Chemical Abstracts*, published by the American Chemical Society.

(1) Author, A. Y., *Am. J. Physiol.*, 79: 289 (1927).

Papers presented at the Sections of the AMERICAN PHARMACEUTICAL ASSOCIATION's annual meeting become the property of the ASSOCIATION and may at the discretion of the Editor be published in the JOURNAL. Papers presented at these Sections may be published in other periodicals only after the release of the papers by the Board of Review of Papers of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

The Editor will appreciate comments from Board of Review and Committee on Publication, members, authors and others interested.

The panel, Phos Kai Elpis of the AMERICAN INSTITUTE OF PHARMACY, represents Light and Hope, the woman symbolic of Hope leads the invalid toward Light, the lamp on the pedestal symbolizes, in this interpretation, the knowledge to cure. The woman holds the staff of Æsculapius, the invalid follows, hoping that the Science of Medicine will restore him to health.

The designer, Ulysses A Ricci endeavored to express in this bas relief panel Pharmakeutike of the AMERICAN INSTITUTE OF PHARMACY, the advancement of Pharmacy The youth depicts the progressive step, the senior represents the pioneer, observing the improvements made as fruits of his earlier researches

THE SCULPTURAL PANELS OF AMERICAN INSTITUTE OF PHARMACY

The designer of the two bas-relief panels of the AMERICAN INSTITUTE OF PHARMACY is Ulysses A. Ricci of New York City, and they were carved in place by John Donnelly under Mr Ricci's supervision. The latter states that he has endeavored in the panel on the left, *Pharmakeutike*, to express the progress and advancement of pharmacy. The youth represents the progressive step, the senior represents the pioneer in pharmacy, looking on and observing the advancement made—the fruits of his earlier researches.

The following, part of a paragraph from an introductory lecture to a course in History of Pharmacy by Dr. Edward Kremers before the American Association of Colleges of Pharmacy at the Madison meeting,¹ may be applicable in this connection.

'If Greek literature was brought to Italy and thence to countries north of the Alps after the capture of Constantinople by the Turks, when Greek scholars sought refuge for themselves and their manuscripts in Italy and elsewhere, Greek medical texts had previously been spread over northern Africa and across the Mediterranean into Italy and Spain by the Moors. Not the original Greek, it is true—in this respect the medico pharmaceutical renaissance differed from the later rebirth of classical Greek literature—but through Syrian and Persian translations and then into Arabic. Just as in ancient Greece lay medico pharmaceutical practice had gained for itself a social position of its own as opposed to priestly standing, so during the middle ages, medicine and likewise pharmacy acquired footholds of their own quite independently of the monasteries and convents. With it came the separation of pharmacy from medicine as foreshadowed by the public apothecary shop of Bagdad in the 9th century, and as it was further developed in some of the Italian cities as reflected in the edict of Roger of Sicily, and more particularly in the edicts of Frederick II, ruler of the Holy Roman Empire of the German Nation from 1215 to 1250. Not that the separation was complete. For a long time physicians and apothecaries were members of the same guilds. Moreover, the physicians for a long time constituted the ruling branch of the professions united in the same guild and lorded it over their former confrères even after the apothecaries were permitted to have their own guild.'

The other panel, *Phos Kai Elpis*, depicting a woman—hope leading the invalid—represents Light and Hope, the woman, symbolic of Hope leads on toward

¹ See JOURNAL A. P. H. A., December 1933, pages 1270-1279.

Light—the lamp on the pedestal, symbolizing in this case the knowledge to cure, she holds the staff of Æsculapius and the invalid follows, hoping that the science of medicine will restore him to health

The following lines are taken from the address heretofore quoted

'Medico pharmaceutical practice of the primitive Celts and Germans had been largely in the hands of 'wise' women and priests as was the case with other primitive peoples. Pagan practices, medico pharmaceutical as well as religious, centered about the descendant of the 'wise' woman of an earlier civilization "

Dr Charles Moore,¹ in speaking at the dedication of the Pharmacy Building, said that into the sphere of the architectual influence exercised by the Lincoln Memorial the Pharmaceutical Building comes. Referring to the former, he said, "the building, like the man, belongs to the ages." "On its inner walls are carved Lincoln's Gettysburg Address and his Second Inaugural, heart-born thoughts expressed in diction comparable with Pericles' immortal oration over the Greeks who fell at Thermopylæ. This building (Pharmacy) has become a vital portion of the frame to the Lincoln Memorial picture." Dr Moore said—"How vital is this relationship was very recently told me by your reticent architect, John Russell Pope

'When plans were being made to mark Abraham Lincoln's birthplace at Hodgenville Kentucky, the program of competition called for one building to embody in its architecture as well as its contents the spirit of Lincoln. I submitted a design based on this representative idea. When a totally different scheme was adopted, I put away my drawing sadly as every artist does when he finds one of his conceptions fails of realization. Years passed. This Pharmaceutical Building came to me. I made many sketches. One day the design for the Lincoln Birthplace came to mind. I got it out of its repose and found that to my mind essentially it solved the double problem of a building with a purpose and yet in spirit akin to the Monument in whose company it stands

"Such in brief is the story of the inception and conception of this Pharmacy Building. unconsciously the spirit of the design—its elegant simplicity, the richness of its landscape setting, its thorough appropriateness, instantly impress artist and layman alike." Dr Moore concluded by congratulating the ASSOCIATION on providing a fitting home for the life-saving service the profession performs and expressed the hope that the members would persevere in well-doing in spirit and in architecture

PROFESSIONAL TRAINING FOR LIBRARIANS

Charles C. Williamson, dean of the School of Library Service, Columbia University, writing in *New York Times* of November 10th states that "an entirely new type of professional training for librarians will result from action recently taken by the faculty of the School of Library Service, Columbia University

This action consists of the adoption of a new curriculum designed to prepare the student for the higher levels of professional library service. The public library will, for example, be treated less as an efficient machine for the circulation of books and more as a primary agency in every community for adult education. In all but the larger centres it also will be viewed as the focal point for the cultural and intellectual interests of the whole population outside of the formal education provided by the public schools."

¹ Chairman, National Commission of Fine Arts

EDITORIAL

E G EBERLE, EDITOR

2215 Constitution Ave , WASHINGTON, D C

THE PHARMACOPŒIA AND NATIONAL FORMULARY

THE first American Pharmacopœia, "Pharmacopœia for the Use of Army Hospitals" was compiled by William Brown, M D , at Lititz, Pa , and published in Philadelphia in 1778, a second edition appeared in 1781 (see JOURNAL A PH A , November 1927, page 1090, October 1930, page 1041)

The Pharmacopœia of the Massachusetts Medical Society was presented in manuscript June 5, 1807, it was "prepared conformably to a vote of the Counselors, passed on the 3rd day of October 1805, and published in Boston, December 17, 1807 " The following paragraphs are quoted from the Preface

' Such a work is mutually convenient to the physician and apothecary As it is the business of the physician to prescribe and the apothecary to prepare medicines the physicians as a body ought to point out those articles of medicine, which they shall ordinarily employ, and the standard preparations of them "

Only the last lines of the last paragraph are quoted

"They (the members of the Massachusetts Medical Society) cannot therefore hesitate to solicit the aid of all scientific men in effecting a revolution, so very desirable for the correct practice of medicine, a revolution which concerns the reputation and success of every medical practitioner, and the health and safety of every individual "

The Pharmacopœia of the New York Hospital was published in 1816 A copyright was obtained by Collins & Co in conformity to the Act of the Congress of the United States, entitled an Act for the Encouragement of Learning, etc The publication was prepared by Samuel L Mitchell and Valentine Seaman, *Committee*

The first Pharmacopœia of the United States, officially recognized and of which the history is given in subsequent editions of the U S Pharmacopœia, was prepared under the direction of Dr Lyman Spalding and appeared December 15, 1820, and copyrighted on the same date by Ewer and Bedington, Cornhill, Number 51, printed by Wells and Lilly, of Boston (See JOURNAL A PH A , August 1917, page 675)

The United States Pharmacopœia XI will become official June 1, 1936 Instead of making comment at this time, reference is made to the "Report on the United States Pharmacopœia, Eleventh Revision" by Chairman E Fullerton Cook, published in the September JOURNAL A PH A , on pages 796-800 and to the historical accounts printed in the forthcoming and prior editions of the Pharmacopœia

The National Formulary VI will become official at the same time as the U S Pharmacopœia XI The National Formulary has an historical introduction to which reference is made, to recent Council Letters bearing on the subject and the report of Chairman E N Gathercoal, published in the JOURNAL A PH A for August, pages 689-694

The Pharmaceutical Recipe Book II, will be completed at an early day and reference is here made to the report of Chairman J Leon Lascoff in the August issue of the JOURNAL, pages 694-699

The two standards reflect credit on the professions and a valuable service has been rendered by the publication of the Recipe Book

The Pharmacopœia XI and National Formulary VI will be on sale December 16th

LIMITATION OF THE NUMBER OF PHARMACISTS

EVERYWHERE the matter of limiting the number of pharmacists is a subject for discussion and this applies to all other lines of activities, in every case the remedy is clear enough but in most instances, if not all, the application is very difficult or impossible, perhaps we need a new attitude on the definition of rights. There is a difference relative to the right of opening a drug store for service and of another where the purpose is an investment on which to make profit and because of larger means or ability in handling money and merchandise and using these means for the destruction of another with smaller means or lesser ability.

The subject is discussed in European pharmaceutical publications relative to pharmacy, here as elsewhere there are extreme views which are answered by those who hold that every citizen should have free choice of a profession, or at least training for a profession, and no limitations should be placed. Germany reduced the number of University students in 1934 by about 60 per cent. In France, the number of pharmacy students has increased, in Italy the sale of medicinal products is allowed only by pharmacists and the authority to open and carry on a pharmacy is in the hands of the Board of Health and the Mayor, a provision being that a new pharmacy may not be opened at less than 500 metres from another already in existence, modification in sparsely settled communities applies.

The foregoing comments are made for the purpose of showing that the difficulties which obtain here are also subjects of discussion in other countries where the possibilities for regulation are not so difficult, all of which points to the necessity of better coordination, and greater cooperation, and a consideration of right and tempering the desire for wealth and power.

PHARMACY AND THE AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

BY JOHN C. KRANTZ, JR. *

THE pharmaceutical sciences are very embracing in their scope. For a number of years an effort has been put forth to establish definitely for pharmacy a place in the semi-annual meetings of the American Association for the Advancement of Science. This goal was achieved last June at the Minneapolis meeting, where pharmacy held a session as Section N2 along with Section N Medical Sciences. The meeting was well attended and the papers presented were comprehensive in their scope and indicated the definite increment of progress achieved by the scientific workers in the field of drugs.

Another pharmaceutical program is being planned for the coming St. Louis meeting (December 30th-January 4th) of the American Association for the Advancement of Science.

* *Councilor* from the AMERICAN PHARMACEUTICAL ASSOCIATION to the American Association for the Advancement of Science

vancement of Science At this meeting Section N2 Pharmacy is planning two sessions, one, a joint session with Section N Medical Sciences, and two, an individual section

The following papers have been accepted for the two sessions

PROGRAM, AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

(N) Medical Sciences

(N2) Pharmacy

- 1 "The Meaning of the Phenol Coefficients" George Reddish, St. Louis College of Pharmacy (15 minutes)
- 2 "Chemistry of Aloin and Some Related Materials," John H. Gardner, Washington University, St. Louis, Mo. (20 minutes)
- 3 "Some Unsymmetrical Aryl Sulfides and their Bactericidal Properties," Noel E. Foss, School of Pharmacy, Duquesne University (20 minutes)
- 4 "The Effect of Chlorinated Ethylenes on the Perfused Leg Vessels of the Frog" John C. Krantz, Jr., C. Jelleff Carr, Ruth Musser and William Harne, School of Medicine, University of Maryland (15 minutes)
- 5 "The Use of the X-ray in Determining the Value of Enteric Coatings," F. S. Bukey, College of Pharmacy, University of Nebraska (20 minutes)
- 6 "The Differential Pharmacognosy of the Two Lobes of the Pituitary Gland," Heber W. Youngken, Massachusetts College of Pharmacy (15 minutes)
- 7 "Microchemical Pharmacognosy," Elmer H. Wirth, School of Pharmacy, University of Illinois (15 minutes)
- 8 "Crude Drug Assays of the U. S. P. XI," C. B. Jordan and H. G. DeKay, School of Pharmacy, Purdue University (15 minutes)
- 9 "The Determination of Iodine in Thyroid Combination," George D. Beal, Mellon Institute, Pittsburgh (15 minutes)

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, JOINT SESSION OF SECTION (N) MEDICAL SCIENCES AND (N2) PHARMACY, PHARMACY PROGRAM

- 1 "The New Alkaloid of Ergot," Marvin Thompson, School of Pharmacy, University of Maryland (20 minutes)
- 2 "Further Studies on the Adrenal Cortical Hormone," W. M. Frior and Arthur Grollman, Departments of Surgery and Pharmacology and Experimental Therapeutics, Johns Hopkins University (20 minutes)
- 3 "Cyanide Poisoning and Its Treatment," K. K. Chen, C. L. Rose and G. H. A. Clowes, Indianapolis, Ind. (20 minutes)

The councilors urge that publicity be given to this meeting in the vicinity of St. Louis and that the schools of pharmacy send delegates to attend and participate in the discussions

JAPANESE PHARMACOPŒIA COMMISSION

THE revised law creating the Commission for revising the Japanese Pharmacopœia is placed under the supervision of the Minister of Home Affairs. The Commission is composed of one president and not more than sixteen members. Temporary members may be appointed if necessary for special work. The secretaries are appointed for the Commission on recommendation of the Home Minister. The Commission comprises seven physicians and surgeons.

Fumihide Okada, chief of the Health Bureau of the Department of Home Affairs. Chika-hiko Koizumi, Surgeon-General. Shunichiro Takasugi, Inspector General of Fleets and Hospitals.

Kenzo Tamura, Doctor of Medicine, professor of the Imperial University of Tokyo Junjro Shimazono, Doctor of Medicine professor of the Imperial University of Tokyo Taichi Kitajima Doctor of Medicine, professor of the medical department of Keio University, and the president of the Japan Physicians' Union Chujiro Nishino, Doctor of Medicine, professor of the medical department of Keio University

The president of the Commission and seven pharmacists are members

Katsuzemon Keitatsu, Doctor of Pharmacy, professor of the Imperial University of Tokyo (who has the court rank of shoshun and decorated with the Third Order of Merits) Yutaka Kinugasa, Doctor of Pharmacy, member of the Imperial Hygienic Laboratory in Tokyo Eizo Machiguchi Doctor of Pharmacy, member of the Imperial Hygienic Laboratory in Tokyo Dunta Taguchi, Pharmacist General Heizaburo Kondo Doctor of Pharmacy professor of the Imperial University of Tokyo Yasuhiko Asahina Doctor of Pharmacy, professor of the Imperial University of Tokyo Akira Ogata Doctor of Pharmacy, professor of the Imperial University of Tokyo Naoichi Fujita, Doctor of Pharmacy, assistant professor, Imperial University of Tokyo

One physician and two pharmacists are temporary members, one of the latter is also a Doctor of Medicine

Takehiko Yuasa, director of the Sankyo Kabushiki Kaisha and the president of the Tokyo Drug Manufacturers' Guild Takaoki Sasaki Doctor of Medicine, head physician at the Kyoundo Hospital Kametaro Kawai, Doctor of Medicine, president of the Japan Pharmacists' Union

The following are secretaries, five are physicians

Atsuki Shiramatsu, head of the medical affairs section, Department of Home Affairs Masabumi Ishio, Doctor of Medicine, engineer of the Imperial Hygienic Laboratory in Tokyo Mikiyoshi Ito, Bachelor of Medicine Chuzo Hata assistant professor of the Tokyo Imperial University and head physician of its attached hospital Seishi Takagi Doctor of Medicine and assistant-professor of the Tokyo Imperial University

The following are technicians and pharmacists

Jin Matsuo engineer in the Department of Home Affairs Tatsuo Kariyone Doctor of Pharmacy Unji Konno, Doctor of Pharmacy Kichiro Yoneda, Doctor of Pharmacy Kakuji Ishifuku, Pharmacist Lieutenant-Colonel Shunta Shimizu Doctor of Pharmacy, Pharmacist Commander

Tri-State Window Display of Pharmacist Frank Nau, Portland, Ore

THE SULPHUR OINTMENTS AND THEIR ASSAY *¹

BY CHARLES E BRADY AND HENRY M BURLAGE ²

INTRODUCTION

The United States Pharmacopœia and the National Formulary recognize three ointments containing elemental sulphur in the sublimed form (a) Sulphur Ointment, U S P, which is a simple mixture of sublimed sulphur (15% by weight) and benzoated lard, (b) Alkaline Sulphur Ointment, N F, a more complex mixture of sublimed sulphur (20% by weight), K_2CO_3 , water and benzoated lard and (c) Compound Sulphur Ointment, N F, a still more complex ointment containing sublimed sulphur (15% by weight), precipitated $CaCO_3$, cade oil, soft soap and lard

Since the U S P and the N F serve as legal standards for maintaining the strength and purity of official medicaments it seems desirable to have a satisfactory assay for these three ointments

PROPOSED METHODS

Methods which oxidize the S to H_2SO_4 and subsequent precipitation with $BaCl_2$ test solution are tedious and difficult to apply to pharmaceutical preparations containing sulphur, especially the ointments Of the oxidation methods that have been especially applied to these ointments are those of Evers and Elsdon (1) The ointment is heated with a mixture of concentrated HNO_3 and Br_2 and the excess of the latter removed, diluted with water and the aqueous solution extracted with ether to remove the fat, or a mixture of Br_2 and $NaOH$ may be used to bring about the oxidation Both procedures are tedious and in general give low results

Simple methods employing organic solvents to separate the fatty material and other ingredients from the sulphur cannot be applied as sulphur is appreciably soluble in most organic solvents This has been proved by Henville (2) and substantiated by work done in our laboratories

Attention was, therefore, turned from the usual long oxidation-gravimetric methods to those involving volumetric procedure In 1932 Castiglioni (3) proposed the conversion of the sulphur contained in acetone extracts of rubber into thiocyanate by boiling with KCN solution under a reflux and evaporating to dryness and the thiocyanate determined by Shulek's method (4) in which the excess of cyanide is converted to glycol nitrile by formaldehyde and then determined by titrating with standard $AgNO_3$ solution in a solution acidified with HNO_3 Allport (5) investigated this method and found that it gave low results for ointments and modified the procedure by treating the sample with a reagent consisting of KCN (40

* Scientific Section, A PH A, Portland meeting, 1935

² Professor of Pharmacy School of Pharmacy, University of North Carolina

Gm), and triethanolamine (90 cc) dissolved in H_2O (95 to 1000 cc) and refluxing in the presence of soft paraffin and pumice to convert the S to KCNS, adding 0.1N $AgNO_3$ and titrating the excess with 0.1N ammonium thiocyanate using ferric alum as an indicator

In 1934 Fleck and Ward (6) proposed the following method which they claim to be shorter than that of Allport's and is not affected by sulphates. The material is refluxed with a solution of Na_2SO_3 to convert the S quantitatively to $Na_2S_2O_3$ and the excess sulphite removed by the addition of HCHO and acetic acid and the thio sulphate titrated by 0.1N iodine solution using starch as an indicator. Soft paraffin is added as in the previous method to accelerate the reaction. Work in our laboratories did not substantiate the claims of Allport and of Fleck and Ward with regard to the accuracies and brevities of time claimed for their methods.

In 1933 Shulek (7) proposed a method for the determination of sulphur in sulphur-bearing drugs whereby the sample is treated with KCN in the presence of a small amount of H_2O and acetone converting the S into KCNS and after boiling with boric acid, the thiocyanate is determined volumetrically by the method of the same author (8). This investigator found that in slightly acid solutions alkali cyanides and thiocyanates with bromine water forms cyanbromide quantitatively according to the reaction $HCNS + 4 Br_2 + 4 H_2O = H_2SO_4 + 7 HBr + CNBr$, the latter compound being stable in acid solution. The excess of bromine is removed by the addition of phenol which does not react with CNBr in the course of 3-4 hours. Potassium iodide is then added which reacts with CNBr in acid solution to liberate iodine as follows $CNBr + 2 HI = HCN + HBr + I_2$. The latter substance may be determined by titration with 0.01-0.1N sodium thiosulphate using starch as an indicator. Our investigations show that this method could be used for the determination of elemental sulphur in ointments when modified as follows

"Weigh accurately into a small beaker (50 cc capacity) a sample of ointment equivalent to 0.02-0.04 Gm of S. Distribute on the sample about 0.2 Gm KCN add 8-10 drops of water and 15 cc acetone and evaporate to dryness at a temperature sufficiently high to melt the ointment. Repeat the process of warming with acetone and follow by subsequent evaporation twice, using each time 5 cc of acetone (or until all of the sulphur has been converted). Dissolve the residue in water and filter through a small filter. Heat the fatty material remaining in the beaker with 5 cc of water almost to boiling cool somewhat and pass the aqueous liquid through the same filter. Repeat this procedure 3-4 times. The combined filtrates are received in a 125 cc glass stoppered Erlenmeyer flask, add 1 Gm of boric acid and boil gently for 10 minutes. (If a clear filtrate is not obtained, add the boric acid first and in some cases 0.5 Gm coarse pumice may be necessary to accomplish this, boiling 10 minutes, filtering and washing the filter as described above.) Acidify the cooled solution (amounting to 50-60 cc) with 5 cc phosphoric acid (20%), add bromine water dropwise until the solution is distinctly yellow, add phenol (5%) until the solution is decolorized. Shake well and set aside for $\frac{1}{4}$ hour, add 0.5 Gm KI and allow to stand in the dark for $\frac{1}{2}$ hour, keeping the flask securely stoppered, and then titrate in the usual manner with 0.1N $Na_2S_2O_3$ using fresh starch solution as an indicator. (1 cc 0.1N $Na_2S_2O_3$ = 0.01603 Gm S)

EXPERIMENTAL

Samples used in the investigation consisted of Sublimed Sulphur, U. S. P., of a commercial sample of Sulphur Ointment, U. S. P. (No 1), a sample of sulphur ointment prepared in the laboratory according to the official directions (9)

(No 1-A), alkaline sulphur ointment prepared according to the N F (10) (No 2), Compound Sulphur Ointment prepared according to the N F (10) (No 3) and a commercial sample stated to be twice the official strength for sulphur ointment (No 3-A)

SUMMARY

1 A modification of Shulek's volumetric method for the determination of Sulphur in drugs is proposed for the assay of the official sulphur ointments

2 The proposed method has been found to be applicable to the official ointments and is applied with promising results to samples of the three official ointments carefully prepared in the laboratory and to two commercial samples of which one was stated to be twice the official strength

A NOTE ON THE ASSAY OF MASS OF FERROUS CARBONATE *

BY JOHN C KRANTZ, JR, AND C JELLEFF CARR ¹

INTRODUCTION

Based upon the work of Scott (1) and Knop (2), Krantz and Vidal (3) suggested the use of diphenylamine as an indicator in the titration of Mass of Ferrous Carbonate with tenth-normal potassium dichromate. This suggestion was adopted by the Revision Committee of the U S P XI owing to the advantages offered by diphenylamine as an inside indicator, over potassium ferricyanide as an outside indicator.

The formation of the green chromic ion makes it somewhat difficult for the inexperienced worker to determine sharply the end-point of the titration. To obviate this difficulty, the present investigation was begun, with the aim to introduce the volumetric reagent, tenth-normal ceric sulphate solution, in place of the

* Scientific Section, A Ph A Portland meeting 1935

¹ Department of Pharmacology, School of Medicine, University of Maryland

corresponding dichromate solution. The use of ceric sulphate as an oxidizing volumetric reagent has been extensively studied by Smith (4)

EXPERIMENTAL

A sample of Mass of Ferrous Carbonate was prepared according to the directions in the U S P X. The theoretical yield of ferrous carbonate in the mass is 41.5 per cent.

This mass was assayed using potassium dichromate tenth-normal solution with diphenylamine T S as the indicator. Using this method, the mass assayed above the theoretical amount of FeCO_3 , namely, 43.2 per cent. This higher value is in conformity with the findings of Hartley and Linnell (5) who suggested that the oxidations occur in the following order: ferrous iron-carbohydrate indicator. Using tenth-normal ceric sulphate as the volumetric reagent, the mass showed the following percentages of ferrous carbonate: 40.6, 40.4, 40.4, 40.5, 40.5, 40.3, 40.6 and 40.6. When the pure ferrous sulphate is titrated in the absence of honey and sugar, the results with the two volumetric reagents are identical.

The results using ceric sulphate are closer to the theoretical amount of ferrous carbonate and the end-point is much sharper. Ortho phenanthroline, an indicator recommended by Smith (4) in the titration of ferrous salts with ceric sulphate, gave satisfactory results and a strikingly sharp end-point.

The following procedure is recommended:

Dissolve about 1 Gm of Mass of Ferrous Carbonate, accurately weighed, in 15 cc of diluted sulphuric acid, add 10 cc of diluted phosphoric acid and 100 cc of distilled water. Immediately titrate with tenth-normal ceric sulphate, using 0.5 cc of diphenylamine T S as the indicator. Each cc of tenth normal ceric sulphate is equivalent to 0.01159 Gm of FeCO_3 .

CONCLUSION

Ceric sulphate solution has been advantageously employed in the assay of Mass of Ferrous Carbonate.

STUDIES ON CUDBEAR *

BY E H WIRTH, L E MARTIN AND P G SODERDAHL ¹

Cudbear as a coloring agent for pharmaceutical preparations came into use about 1874 (1) and in spite of complaint involving principally its lack of uniformity, it has enjoyed considerable popularity. Although the tincture was previously official, cudbear as such, did not appear until the N F IV, where it was defined as

* Scientific Section, A Ph A, Portland meeting, 1935

¹ University of Illinois, College of Pharmacy, June 1935

"A purplish red powder prepared from species of *Rocella*, *Lecanora* and other lichens" The monograph in the N F IV included tests for brazilwood, logwood and coal-tar colors, and allowed 35% ash No marked change was made in the N F V except that the maximum ash limit was placed at 12%

Various attempts have been made to replace cudbear with one or another of the synthetic organic dyes, the most favorable one being amaranth suggested by Morrison (2) who offers as his objections to cudbear, the hinderance in filtration, color changes in acid and alkaline solution, fading and lack of uniformity (3) The bulletins of the N F VI, however, show considerable controversy (4) over the replacement of cudbear with amaranth in N F formulas, the objections to change being that amaranth does not impart the same color as cudbear, it therefore being unwise to change the color of established preparations, that it is satisfactory, that no lack of uniformity has been observed, and that some states have regulations restricting the use of coal-tar dyes The controversy finally resulted in the committee voting for the retention of cudbear At the request of Chairman Gathercoal the studies published herewith were made in connection with the revision of the cudbear monograph

Earlier objections to the use of cudbear were based particularly upon the lack of uniformity of tinctures made from various lots Attempts by Gardner and Raubenheimer (5), Arny (6) and Beringer (7) to prepare extracts of cudbear for use in coloring pharmaceutical preparations did not meet with considerable success In the cudbear of that time it had been noted that sodium chloride (8) seemed to be present in many samples in considerable quantity Craig (9) among others reported the lack in uniformity in color, concentration and tint The N F IV seemed to solve the variation in the color of preparations colored with tincture of cudbear by substituting cudbear itself in the formulas It, however, still allowed 35% of ash which did not remedy the sodium chloride situation In the N F V the ash limit was reduced to 12% which then resulted in the disappearance of sodium chloride as a diluent

Cudbear belongs to that interesting group of dye substances, orchil, cudbear and litmus, which are commercially produced from various lichens, principally *Rocella* and *Lecanora* Beringer (7) (1912) mentions *Lecanora tartarea* of Northern Europe as the principal source Most of the present-day cudbear, however, is produced in the Canary Islands, Madagascar and on the African coast

Very little definite information relative to the manufacture of cudbear is available, the manufacturers apparently guarding their secrets rather closely In general, however, the lichens contain colorless glucosides (?), acids and ester-like compounds of orcin which upon oxidation in the presence of ammonia split first into orcin, a colorless compound and are then converted into orcein and other colored substances The variety of colored substances produced is rather considerable and is discussed at length by Beringer (7) Altering the source of the lichens or modifying the process and the alkali used produces different end products which result in the different commercial substances

Cudbear itself is usually produced by digesting the lichens with about three times their weight of solution of ammonia at 60° for from three days to a week, air being admitted as a considerable requisite The mixture assumes first a blue and subsequently a red color when the product is dried and ground

The problem then consisted (1) in studying the uniformity of cudbear, (2) in studying its quality and purity and finally (3) in establishing, if possible, standards to insure these points. To this end 16 samples were obtained from various sources representing in a fair degree the average cudbear on the market. The samples were as follows:

Sample 1	U of I Pharmacognosy Museum	Sample about 40 years old
Sample 2	Local druggist's stock	Age and source unknown
Sample 3	Mass College of Pharm	Age and Source unknown
Sample 4	U of I Coll of Pharm Dept of Pharm stock	Purchased 1933 from a New York wholesale house
Sample 5	Local druggist's stock	Purchased 1929 from Chicago wholesale house No 1
Sample 6	Purchased from Chicago wholesale house No 2,	1932
Sample 7	Purchased from Chicago wholesale house No 3	Age unknown
Sample 8	Local druggist's stock	Age and source unknown, apparently old
Sample 9	State Ed and Research Hosp Pharmacy	Purchased 1931 from a New York wholesale house
Sample 10	State Ed and Research Hosp Pharmacy	Purchased 1933 from a Chicago wholesale house
Sample 11	Chicago wholesale house No 4	Received by them from foreign dealer "A" 1934
Sample 12	Chicago wholesale house No 4	Received by them from foreign dealer "B" 1934
Sample 13	Chicago wholesale house No 4	Received by them from foreign dealer "C" 1934
Sample 14	Chicago wholesale house No 4	Received by them from foreign dealer "D" 1932
Sample 15	Chicago wholesale house No 4	Received by them from foreign dealer "E" 1929
Sample 16	Southern Illinois wholesale house	1934

COLORIMETRIC VALUE

Since cudbear is employed solely as a coloring agent, a study of the colorimetric value of the samples at our command seemed the best way to determine their quality. The method suggested by Scoville (10) employing standardized solutions of inorganic chemicals as devised by Army and his co-workers (11) appeared well adapted to this purpose. The method is as follows:

' Accurately weigh one gram of Cudbear previously dried over sulphuric acid, macerate it for 18 hours in 100 cc of a mixture of 3 volumes of alcohol and 1 volume of water, cooled to room temperature before measuring. Shake frequently and allow the drug to settle. To 5 cc of the clear liquid, accurately measured, add 15 cc of alcohol then gradually add distilled water to make 1000 cc and mix. Compare the color of this freshly prepared solution in Nessler tubes or in a colorimeter with the color of a standard color solution prepared as follows:

Decinormal Cobalt Chloride	0.75 cc
Two hundredth-normal Potassium Dichromate	0.30 cc
Ammonium Carbonate T S	3.00 cc
Distilled water a sufficient quantity to make	10.00 cc

The color of the cudbear solution should not be less than that of the standard solution prepared above.'

In carrying out the method the standard solution was set in the colorimeter (B & L Biological No 2400) at a depth of 20 mm. The cudbear solutions were adjusted to equalize the color field, and depth readings taken. Several readings (often by several observers) were averaged and recorded. Two macerations were made from each sample and are designated as "A" and "B". Factors were then calculated for each sample indicating its color intensity as compared with 1.00 =

the standard (Thus, a sample in which the depth reading is less than that of the standard will consequently have a factor larger than 1.00, it being stronger than the standard) Results are given in Table I

TABLE I

Sample No	Depth in Mm A	Depth in Mm B	Average Depth in Mm	Factor
1	18.5	18.1	18.3	20/18.3 = 1.09
2	18.3	18.5	18.4	20/18.4 = 1.08
3	16.4	15.3	15.85	20/15.85 = 1.26
4	17.3	17.0	17.15	20/17.15 = 1.17
5	20.7	20.8	20.75	20/20.75 = 0.97
6	19.5	19.3	19.4	20/19.4 = 1.03
7	16.0	15.7	15.85	20/15.85 = 1.26
8	22.5	22.7	22.6	20/22.6 = 0.88
9	23.8	24.5	24.15	20/24.15 = 0.83
10	20.5	21.3	20.9	20/20.9 = 0.96
11	16.5	15.7	16.1	20/16.1 = 1.24
12	17.0	16.5	16.75	20/16.75 = 1.19
13	15.6	15.0	15.3	20/15.3 = 1.30
14	12.3	12.5	12.4	20/12.4 = 1.61
15	17.3	17.1	17.2	20/17.2 = 1.16
16	17.3	17.0	17.15	20/17.15 = 1.17

COMMENTS ON COLORIMETRIC RESULTS

(1) Color tints between samples and standard check fairly close, at least close enough to make a semi quantitative estimation of color. Slight variations in tint between samples may be due to variation in manufacture or in rare cases to the presence of added coloring substances. In the sixteen samples examined only one such variation was observed, and this was not great enough to materially affect colorimetric observation.

(2) The standard solution should be freshly prepared and should be used at once due to the volatilization of ammonia. The three component solutions used in its preparation, however, are stable, and may be kept as stock solutions. The Ammonia T. S. should, of course, be kept tightly stoppered and the usual precautions involving the effect of ammonia on glass observed. The cobalt chloride and the potassium dichromate solutions should be standardized by the usual chemical means.

(3) Although the strongest sample (No 14) was twice that of the weakest (No 9) in colorimetric strength both were extreme as compared with the entire group. The surprising thing is that for a substance reputed to be so carelessly prepared, the results run astoundingly close. This suggested to us that the manufacturers were employing some means of keeping the color value of cudbear more or less constant. No reference to such a fact appears in the literature or any textbook at our command. Our color findings, however, led us to make a microscopical examination of the cudbear samples with further surprising findings. These results appear elsewhere in this paper. Rather extended subsequent correspondence with foreign and domestic dealers in cudbear, however, substantiated our supposition. It seems to have been a known fact to them that for some time diluents have been used commercially.

(4) It will be observed that 12 samples (75%) ran above standard and 4 (25%) ran below standard. Of those above standard 8 or $\frac{2}{3}$ of them ran over 10% above standard, while of those below standard 2 or $\frac{1}{2}$ of them ran more than 10% below standard. The standard, therefore, as suggested by Scoville seems to be a fair one. Of the sixteen representative samples only two ran more than 10% below the standard.

SOLUBILITY

As a possibility for determining the quality of cudbear a solubility method suggested itself. Approximately 70% alcohol (the tincture menstruum) appeared to be the most likely solvent for such a determination. Solubility tests were run in

conjunction with the colorimetric determinations as follows After a small portion of the supernatant liquid had been withdrawn for the colorimetric tests from the 18 hour macerations, previously described, the balance of each was filtered through a tared filtering crucible, the residue being washed with 70% alcohol until the washings were colorless The residue was then dried at 100° and weighed, the weight obtained representing that portion of the 1-Gm sample of cudbear insoluble in 70% alcohol The results are given in Table II

TABLE II—SOLUBILITY

Sample No	Percentage of Residue Insoluble in 70% Alcohol		Average of A & B	Color Factor (Table I)
	A.	B		
1	63 02	62 48	62 75	1 09
2	69 44	69 05	69 54	1 08
3	65 60	65 17	65 38	1 26
4	72 57	73 22	72 89	1 17
5	69 25	68 91	69 08	0 96
6	69 08	69 42	69 25	1 03
7	67 02	66 10	66 56	1 26
8	66 21	66 04	66 13	0 88

15	73 25	73 32	73 29	1 16
16	65 74	66 12	65 93	1 17

COMMENTS ON TABLE II

While it is true that some of the samples which run high in color value show a low percentage of material insoluble in 70% alcohol (e g, No 3 and No 13) and that some of the samples which run low in color value show a high percentage of material insoluble in 70% alcohol (e g, No 9 and No 10) it can readily be observed that there is no consistent agreement between colorimetric and solubility results Solubility results are therefore no criterion of the tinctorial value of cudbear A comparison of the results, however, does seem to indicate that there may be substances present in some of the samples which do not impart a color but still go into solution in 70% alcohol It is also interesting to note that between 62% and 83% of cudbear is insoluble in 70% alcohol

PURITY

As was previously pointed out the earliest foreign matter reported (8) present in cudbear was sodium chloride To eliminate this the N F V reduced the ash limit from 35% to 12% In order that our cudbear studies be as complete as possible ash determinations were run on the samples These appear in Table III

TABLE III—TOTAL ASH

Sample No	Percentage Total Ash		Av	Color Factor (Table I)
	A	B		
1	13 74	13 92	13 83	1 09
2	7 3	7 55	7 48	1 08

COMMENTS ON TABLE III

It will be observed that 75% of the samples run well under the N F ash limit of 12%. Only one sample (No 8) runs excessively above this limit. Samples 1 and 8 were definitely known to be of considerable age and therefore suspecting their high ash content to be due to the presence of salt, they were extracted with water and gave the customary microchemical tests for NaCl. Samples 14 and 15, however, gave only traces of chlorides.

Color factors have again been carried over from Table I. As is to be expected there is no correlation between ash and color value. *e g*, No 14 the sample of highest color value runs considerably over the ash limit while No 16 the sample lowest in ash is only average in color value. On the other hand, however samples No 8 and No 9 do show high ash and low color value while No 3, No 11 and No 13 show low ash and high color value.

There is always a question as to the selection of an ash limit. The present limit of 12% is probably a satisfactory one. At least it is not severe since half of the samples examined ran under 6.5%.

MICROSCOPICAL

As was previously stated our colorimetric and other analytical results indicated that a microscopical examination of the samples might throw some light on the question of their purity. Such an examination was made, both the original samples and the residues from the (70%) alcoholic extractions being observed. As was to be expected with a substance of the nature of cudbear, the mounts showed considerable quantities of extraneous matter. The most surprising foreign substance found was potato starch, present in variable amounts in about half of the samples and indicating most conclusively that starch is being added as a diluent, presumably to regulate the color value. Since the starch was that of the potato (except No 13, which was wheat) this adulteration no doubt takes place abroad.

Several other tissue elements, not of lichen origin, were found in many of the samples, the most common being woody tissues and hairs (presumably from leaves). These apparently originate from plant parts either gathered with the lichens through carelessness or added intentionally to the lichen mass during or before treatment.

Hyphae from the subhymenial layer of the lichen are abundant in the mounts occurring occasionally as tissue fragments but more often torn apart and more or less broken. The hyphae vary considerably in length and are from 0.002 to 0.006 mm in diameter. In rare cases they show branching. Fragments of the undifferentiated pseudo-parenchymatous portions of the lichens may also be seen especially after clearing with chloral.

Most of the woody tissue appears to be of a dicotyl source, although coniferous wood was found in some samples. We were unable to identify the botanical source.

of either the woody tissue or the hairs. It is highly doubtful whether the woody tissue found was from brazilwood, logwood or other colored woods. It seems rather to be a local adulterant entering through carelessness, being often accompanied by fragments of various bark tissues notably stone cells.

The microscopy of cudbear presents some difficulties. The phloroglucin-hydrochloric acid reaction for lignin cannot be used since the lignified tissue present is already colored pink or reddish by the natural coloring principle of the cudbear. Attempts to remove this coloring principle were more or less unsuccessful. Alcohol will not extract it from the tissue elements. We were, however, able to reduce the dye to its colorless base with sodium hydrosulphite. This reagent, however, also removes the lignin and is therefore of no use in preparing the sample for lignin testing. Identification of woody tissue could be and was based upon the presence of its characteristic elements, tracheæ, tracheids, wood fibres and fragments of medullary rays. Mounts allowed to remain 12-24 hours in chloral became sufficiently clear to facilitate the study of these elements. For the sake of brevity the microscopical results are tabulated in Table IV.

TABLE IV—MICROSCOPIC

DISCUSSION OF TABLE IV

The microscopical studies show that

(1) Where considerable potato starch is present (4, 12 and 16) the color value is fairly constant (about 1.17), except in No. 9 which appears to be grossly adulterated and is low in color value. Samples 4, 12 and 16 appear to be reduced to a definite color value.

(2) No. 13 is diluted with ground whole wheat.

COMMENTS ON TABLE

It will be observed that 75% of the samples. Only one sample (No 8) runs excessively above this limit to be of considerable age and therefore suspecting the loss of salt, they were extracted with water and given. Samples 14 and 15 however gave only traces of chlorophyll.

Color factors have again been carried over correlation between ash and color value. e. g. No 8 runs considerably over the ash limit while No 16, the standard. On the other hand, however, samples No 8 and No 3 No 11 and No 13 show low ash and high color.

There is always a question as to the standard which is probably a satisfactory one. At least it is under 6.5%

MICROSCOPICAL

As was previously stated our conclusion was that a microscopical examination of the tissue and the residues from the (70%) was expected with a substance of the same nature. The quantities of extraneous material found was potato starch, present in the tissue and indicating most conclusively that the material was probably to regulate the color value. No 13, which was wheat) the

Several other tissue elements were found in the samples, the most common being cellulose. These apparently originate from carelessness or added into the tissue.

Hyphae from the substrate were occurring occasionally as they were broken. The hyphae were of varying diameter. In rare cases they were differentiated pseudo-parenchymatous after clearing with chloral hydrate.

Most of the woody tissue appeared to be from the wood was found in some samples. We were unable to

of either the woody tissue or the hairs. It is highly doubtful whether the woody tissue found was from brazilwood, logwood or other colored woods. It seems rather to be a local adulterant entering through carelessness, being often accompanied by fragments of various bark tissues notably stone cells.

The microscopy of eudbear presents some difficulties. The phloroglucin-hydrochloric acid reaction for lignin cannot be used since the lignified tissue present is already colored pink or reddish by the natural coloring principle of the eudbear. Attempts to remove this coloring principle were more or less unsuccessful. Alcohol will not extract it from the tissue elements. We were, however, able to reduce the dye to its colorless base with sodium hydrosulphite. This reagent, however, also removes the lignin and is therefore of no use in preparing the sample for lignin testing. Identification of woody tissue could be and was based upon the presence of its characteristic elements, tracheæ, tracheids, wood fibres and fragments of medullary rays. Mounts allowed to remain 12-24 hours in chloral became sufficiently clear to facilitate the study of these elements. For the sake of brevity the microscopical results are tabulated in Table IV.

DISCUSSION OF TABLE IV

The microscopical studies show that

(1) Where considerable potato starch is present (4, 12 and 16) the color value is fairly constant (about 1.17), except in No. 9 which appears to be grossly adulterated and is low in color value. Samples 4, 12 and 16 appear to be reduced to a definite color value.

(2) No. 13 is diluted with ground whole wheat.

(3) Where an abundance and a variety of foreign matter occur (9 and 10) the color value is usually low. Samples 9 and 10 also show a high residue insoluble in 70% alcohol (Table II) and No 10 is excessively high in arsenic. These particular samples may therefore be exceptions. Samples 13 and 14 on the other hand show some foreign matter and are high in color value.

(4) Woody and leaf tissue show no correlation with color value and appear to be present due to carelessness in collecting and treating the lichens.

(5) All samples contain some foreign matter or other, and it may reasonably be said that no such a thing as a 'pure sample' of cudbear can be found on the market. By a pure sample is meant one containing only lichen tissue and the oxidized color base.

(6) The addition of starch as a diluent, which seems to be extensively practiced, brings up the question whether such a diluent should be permissible. Both the Pharmacopœia and the National Formulary have in the past specified and permitted inert diluents for certain drugs. Starch is, of course, an inert diluent. If a color standard is to be established there will be a natural tendency to meet it but not to exceed it. If the object of the color standard be that of insuring a uniform drug a specified diluent should be permitted. If on the other hand, it be the object of the standard to insure the quality of the drug, no such diluent should be permitted and an effort should be made to prohibit within reasonable limit all foreign matter. The standard should then be placed high enough to insure care in manufacture and discourage dilution.

WOODY ADMIXTURE

Certain woods containing coloring principles seem to be suspected adulterants of cudbear. In the past several editions, the N F has included tests for brazil wood and logwood. It would seem, however, that adulteration with these and other colored woods whose habitats are far removed from those regions where cudbear is produced, would be of rare occurrence. Neither time nor authentic samples were available for a very extensive survey of this question. A few experiments, however, were made with the samples of dye-woods available to us. These consisted of logwood, *Hæmatoxylon campechianum*, brazilwood (Pernambuco wood), *Cæsalpina echinata*, hypericum, *Hypericum perforatum*, cam wood, *Baphia nitida*, fustic, *Chlorophora tinctoria* and red saunders, *Pterocarpus santalinus*. Five tests customarily applied to colored woods were employed using the powdered wood itself, cudbear and samples consisting of cudbear containing 25% of the admixed powdered wood. The tests were as follows:

(1) One gram of the comminuted material consisting of woody material or admixtures of woody material and cudbear was macerated in 100 cc of distilled water for approximately one hour and filtered. The color of the filtrate was observed. (The filtrate was used for the following tests.)

(2) Five drops of glacial acetic acid were added to 5 cc of the filtrate and (A) any color change noted. The mixture was then boiled for one minute and (B) any color change noted. Five drops of stannous chloride T S were then added and (C) any color change noted. The mixture was then boiled for one minute and (D) any color change noted.

(3) 2 cc of basic lead acetate solution were added to 5 cc of the filtrate and (A) the color change noted. The mixture was then acidified with glacial acetic acid and (B) any subsequent color change noted.

(4) 2 cc of lime water were added to 5 cc of the filtrate and the color change noted.

(5) 2 cc of a 10% aqueous alum solution were added to 5 cc of the filtrate and the color observed.

The results of the tests will be found in Table V.

COMMENTS ON TABLE V

A study of Table V shows that while many of the tests are fairly characteristic for the woods themselves, the tests are of doubtful value when the wood is mixed with cudbear. The purplish red coloring principle of cudbear often changes the end color reaction to such an extent as to mask

it entirely or at least to such an extent that it becomes indefinite. It would seem that their histologic characters might be more adaptable to the identification of these woods.

The present N F test (our Test No 2, D) states that logwood and brazilwood give solutions of a deep red color. While this is true for logwood, it is of questionable value for brazilwood. Several samples of brazilwood and Pernambuco wood available to us gave a final light red color alone, and an orange red color when mixed with cudbear. This final orange red does not differ enough from the light reddish brown obtained with cudbear to be distinctive.

Attempts to identify the woody material actually occurring in our commercial samples (see Table IV) as one or the other of these colored woods were not successful. The above tests when applied to these samples did not give positive results. As has been previously mentioned it is doubtful whether these colored woods are found as adulterants of cudbear in more than exceedingly rare cases.

All in all, however, it would seem that the question of the identification of the woody adulterants, both the colored woods and others, must be subjected to considerable further investigation before really dependable means for their identification can be established.

ARSENIC CONTENT OF CUDBEAR

Several shipments of cudbear have in the past been denied entry into this country because of high arsenic content. There is no official arsenic standard for cudbear. This work was undertaken to determine the arsenic content of our samples of cudbear.

The samples for the Gutzit Test were prepared according to the method outlined in A O A C, page 308, part d (12). After digestion and dilution to a definite volume a small sample was removed and the acidity determined.

The generator used was a modification of that given in Hillebrand and Lundell, page 219 (13). Test tubes 10 cm x 1.25 cm were constricted 6 cm from one end, and the end then blown out and fire polished, giving a hollow tube constricted 6 cm from one end. This was fitted to a one hole rubber stopper of such size that it fit a 60 cc wide mouth bottle. The tube for the mercuric bromide paper was 12 cm long and fitted with a rubber stopper. The lower (longer) portion of the tube contained fluted filter paper 8 cm x 3 cm soaked in 20% lead acetate solution and dried. The upper portion contained a roll of the same lead acetate paper well moistened with water and then plugged with cotton and the mercuric bromide tube.

The mercuric bromide strips were strips purchased from A H Thomas & Co, and soaked for one hour in 5% alcoholic solution of mercuric bromide, removed and dried.

The test was carried out according to A O A C, page 308, part 4. These agents were all tested and found to be arsenic free. Standards of 0.010, 0.015, 0.020, 0.025 mg As₂O₃ were run.

along with the unknowns each time a determination was made. The lengths of the stains were measured and graphed according to Thomas (14), in which the ratio of the individual length to the total length is plotted against the concentration. This method gives a straight line graph which eliminates the error due to the possibility of several curves being drawn through the same points as when the length is plotted against the concentration. After trial runs to determine the approximate concentration, a sample was chosen which would give a stain within the range of the standards.

Whenever the lower lead acetate paper turned yellow or dark blue the results were not recorded. It was noticed that uniform results could not be obtained when this occurred.

TABLE VI —ARSENIC CONTENT AS As_2O_3 IN PARTS PER MILLION

Sample No	Parts per Million	Sample No	Parts per Million
1	21.0	9	9.3
2	Insufficient for test	10	4325.0
3	13.0	11	93.0
4	1.73	12	2.0
5	35.2	13	1.24
6	78.6	14	Insufficient for test
7	47.7	15	Insufficient for test
8	Insufficient for test	16	0.25

Each result is the average of two or more samples. The accuracy of the Gutzeit Method has been studied by Neller (15) and found to give an average deviation of $\pm 6.6\%$ from the mean of several determinations, approximately the same degree of accuracy is reported by Barnes and Murray (16).

The standard set for certain fruits is not over 1.4 parts As_2O_3 per million. A recent article by Holmes and Remington (17) gives the arsenic content of American Cod Liver Oils as being from 1 to 6 parts per million. Much of the marine life which we use as food contains varying amounts of arsenic. Shrimps contain up to 20 parts of arsenic per million. Norwegians have been taking as much as one ounce of cod liver oil per day without apparent ill effects. If such amounts are harmless in the oils, fruits and marine foods, then in a coloring agent such as cudbear where the actual amount of drug in the finished product is exceedingly small, an arsenic content up to 50 parts per million should be perfectly safe and possibly justified. It does seem, however, that arsenic is an impurity which enters through carelessness. In a communication from the Department of Agriculture we are advised that six samples received at New York late in 1934 ran 1.2, 1.0, 5.0, 1.0, 2.4 and 1.0 parts per million. It will also be observed that among our own samples several (4, 12, 13, 16) produced in 1933-1934 also ran low in arsenic. This seems to indicate that cudbear with a low arsenic content can be produced if necessary.

The choice of a standard, if it were advisable to establish one, could be based on an amount within the limit of safety as 50 parts per million, but since carelessness appears to be the reason for its presence in large amounts, a maximum of 10 parts per million would be our recommendation. We choose this standard because it would apparently be easy to meet, and would give a coloring agent which would impart practically no arsenic to the finished pharmaceutical preparation. It also corresponds to the arsenic content specified in the present arsenic test of the Pharmacopœia (18).

SUMMARY

The uniformity, quality and purity of cudbear have been studied. While the commercial samples examined exhibited a surprising uniformity in tinctorial value,

the examination disclosed that several had been intentionally diluted, the most common diluent being potato starch

(1) A colorimetric method for the determination of quality and a color standard are advised

(2) Solubility tests are of questionable value in estimating quality

The discussion of purity involves

(3) Studies on ash content which reveal that many of the commercial samples run well under the N F requirements

(4) Microscopical studies which indicate considerable adulteration both intentional (the addition of potato starch as a diluent) and unintentional (the presence of woody, bark and leaf tissues)

(5) The usual methods for the detection of dye woods do not give satisfactory results The presence of dye woods as adulterants of cudbear is, however, probably exceedingly rare

(6) The study of arsenic content reveals that many samples of cudbear have a considerable amount of arsenic present Those produced in 1933 and 1934, however, show a smaller content indicating that the presence of arsenic is probably due to carelessness An arsenic limit of 10 parts per million is tentatively suggested

ASSAY OF LINIMENT OF CAMPHOR *

BY D A OVERBYE AND R E SCHOETZOW ¹

Various methods have been suggested for the determining of camphor in Liniment of Camphor

Mann (2) suggested counterbalancing two pairs of filter papers pouring 0.4 to 0.5 Gm of Liniment of Camphor on one pair and an identical weight of olive oil on the other pair. These two sets of papers were then to be exposed to the temperature of a hot air bath for about twenty minutes and again weighed to determine the amount of camphor present. Cook (3) found that heating at 100° C for three hours drove off all but about one-half per cent of the camphor and, therefore suggested adding about one half per cent as a correction factor.

Cowie and Dickson (4) ascertained that 20 Gm of camphor in 80 cc of olive oil measured 100 cc and that therefore, the volume and weight of camphor in the finished liniment were identical. They proposed to take the specific gravity of the liniment at 15.56° C place the weight equivalent to 10 cc in a beaker, weigh 8 cc of olive oil in a similar beaker and heat in a sand bath at 150° C for thirty to forty minutes, making a correction for the loss in the oil.

Lothuan (5) recommended placing the liniment in a shallow dish, such as the cover of a petri dish to a depth of about one-half millimeter. The dish was then supported on a copper ring and leveled on the water-bath to obtain a uniform layer. This was heated one hour and weighed. He found that further heating would cause a gain in weight of the olive oil while the oil, itself, under these conditions did not gain. This indicated that the oil was affected by the camphor and therefore he placed no reliance on correction figures.

Wallace and Plummer (9) found that cottonseed oil oxidizes faster when heated with camphor than when heated alone as determined by the refractive index, the saponification value and the iodine value before and after heating. They found it was necessary to heat cottonseed oil at 120° C for five hours to completely remove the camphor.

Kebler and collaborators (13) prepared a standard 20% solution of camphor in cottonseed oil and found the optical rotation to be plus 58.5 on the sugar scale in a 200 mm tube. In a series of determinations heating to 150° C to practically constant weight gave fairly concordant results with the polarimetric determinations. They stated that heating may give slightly high results due to the presence of moisture.

Miller (14) says best results are to be obtained in a flat bottomed platinum dish at 110° C for 90 minutes in a well ventilated oven.

Poe Lipsey and Vaughn (11) made a study of the U S P method for determination of camphor in Liniment of Camphor and found that the method gave consistently low results, due to the oxidation of the olein in cottonseed oil. Various kinds of dishes were used but none proved satisfactory.

Dowzard (1) made a series of gravimetric assays on Liniment of Camphor and determined the optical rotation of the samples in angular degrees in a 100 mm tube at 15° C. He then divided the rotation by the per cent of camphor found gravimetrically to obtain a factor whereby

* Section on Practical Pharmacy and Dispensing A Ph A, Portland meeting 1935

¹ Analytical Department of the Chemical and Pharmaceutical Laboratories E R Squibb & Sons Brooklyn New York.

the observed rotation could be converted into per cent camphor. For the seven assays listed the average factor was found to be 1.962.

Cook (3) pointed out that a polarimetric method becomes complicated by the fact that a solution of camphor in olive oil shows a different specific rotation (plus 50.63°) from that exhibited by an alcohol solution (plus 43.52°) and that a correction must, therefore, be made.

Hund (6) determined that cottonseed oil showed no optical rotation and on accurately prepared 10% and 20% solutions of camphor in cottonseed oil found that at 13° C one percent camphor showed an average rotation of 0.493° in a 100 mm tube. Per cent by weight is therefore found by dividing the reading in a 100 mm tube by 0.493. This gave fairly concordant results with the gravimetric method. Malosse (7) says that the specific rotatory power of camphor in olive oil increases with the dilution.

Von Friedrichs (8) studied the polarimetry of camphorated oil with reference to the oil used as a solvent. For liniment prepared with olive oil he derived the factor: Per cent camphor = $1.958 \times \frac{\text{Rotation observed}}{\text{Length of tube in decimeters}}$. Factors are also given for liniments prepared with other oils. He found that ordinary deviations of temperature were almost negligible.

David (10) suggested that 4.0 Gm. of camphorated oil be placed in a flask together with 1 Gm. of calcium oxide and 100 to 120 Gm. of water and the mixture distilled until 60 cc. of the distillate has been collected in a graduated cylinder. Twenty Gm. of sodium chloride were added to the distillate and the condenser washed with ether collecting the ether in the same cylinder. Ether was added to about 50 or 60 cc. and the mixture thoroughly shaken. An aliquot of the ether was then poured into a tared flask weighed and evaporated on the water bath and the residual camphor weighed. From this the per cent of camphor in the original sample was calculated. Lajos (12) reports a method identical with this.

In connection with current work on U. S. P. revision, an assay method has been proposed (15) in which the liniment is dried in an oven maintained at 110° C. for two hours under a stream of carbon dioxide.

Work was undertaken to obtain comparative results by polarimetric and gravimetric methods. Dowdard's factor was used in the polarimetric work. The carbon dioxide method was followed as outlined in the "Bulletin of the Subcommittee on Organic Chemicals." A third determination was made in an electric oven at 110° C. without carbon dioxide protection, controls being run on the oil of cottonseed used for the liniment.

	Polarimetric	Per Cent Camphor in Sample	
		Under CO ₂ at 110° C.	Exposed to Air at 110° C. ¹
Sample No. 1	18.44%	18.63%	18.25%
Sample No. 2	19.19%	19.52%	19.02%
Sample No. 3	19.66%	19.68%*	19.41%

* The actual figure was 20.74 but correction of 1.06 was necessary due to loss when the oil itself was dried.

¹ The results given for the assays exposed to air at 110° C. are corrected for increase or decrease in weight of the oil used.

Twenty-eight samples of cottonseed oil were tested for volatile matter at 110° C. under carbon dioxide for two hours, only two samples showed any significant change. The results were as follows:

1 0 01 % increase	8 0 04 % increase	15 0 03 % increase	22 0 002% increase
2 0 01 % loss	9 0 04 % increase	16 0 004% increase	23 0 08 % increase
3 0 81 % loss	10 0 05 % increase	17 0 02 % increase	24 0 085% increase
4 1 79 % loss	11 0 005% increase	18 0 015% increase	25 0 039% increase
5 0 02 % increase	12 0 04 % increase	19 0 02 % increase	26 0 068% increase
6 0 01 % increase	13 0 07 % increase	20 0 06 % increase	27 0 066% increase
7 No loss or gain	14 0 007% increase	21 0 09 % loss	28 0 065% increase

A known solution of camphor in cottonseed oil was made up in a glass-stoppered, tared Erlenmeyer flask, 103 8016 Gm of cottonseed oil were weighed into the flask and 25 9704 Gm of camphor were added to make 129 8520 Gm of exactly 20% Liniment of Camphor. The flask was tightly stoppered immediately after the addition of the camphor. The mixture was warmed gently (not over 40° C) and shaken until the camphor was completely dissolved. The weight of the flask and contents was then checked to determine possible loss during solution, a loss of 0 0123 Gm was found, but as this represented only 0 01% of camphor it was disregarded. Optical rotation of this liniment was then determined in a 50-mm tube at 25° C and found to be plus 5 07. The oil used in the preparation of the liniment had a rotation of minus 0 03 in a 50-mm tube at 25° C. Using Dowzard's factor this gave 19 91% camphor based on the rotation of the liniment. When corrected for the rotation of the oil, the result was found to be 20 01% camphor. By the carbon dioxide method at 110° C the prepared liniment showed 20 02% camphor, but a blank on the oil showed a loss of 0 13% making a net result of 19 89% camphor. Another portion heated in a glass evaporating dish at 110° C till no odor of camphor was discernible showed 19 30% camphor, but a blank on the oil corrected this to 19 92% camphor.

	Polarimetric	CO ₂ Method	U S P X Method
Liniment	19 91% camphor	20 02% camphor	19 30% camphor
Correction for Oil	plus 0 10%	minus 0 13%	plus 0 62%
Net	20 01% camphor	19 89% camphor	19 92% camphor

It is apparently necessary to run a blank on the particular oil used in any given Liniment of Camphor if an accurate assay is to be obtained.

"APOTHECARY SHOPS OF COLONIAL TIMES"

A compilation of scattered historical data published in pharmaceutical literature and other sources of the past few years and describing apothecary shops, proprietors and distinguished customers of colonial days. The oldest American apothecary shop still in existence and doing business is the Rau Pharmacy in Bethlehem, Pa. The oldest record of an apothecary shop in America (1646) is that of Wm Davies of Boston, Mass. This was probably the first store devoted exclusively to Pharmacy in America.

TINCTURE OPIUM * 1

BY P L BURRIN AND F E BIBBINS

Tincture of opium that was made according to directions given in the United States Pharmacopœia (1) contained a very large amount of precipitate in a short time. This precipitate continued to form even after aging and subsequent filtration. A sample of such a product that had been aged and filtered several times during its manufacture was still so turbid that one could not see through a column of the liquid which was 20 millimeters in diameter. This sediment does not seem to adhere to the sides or the bottom of the bottle, but remains thoroughly suspended for a long time. The unsightly appearance of such a product will immediately suggest the desirability of a more elegant tincture.

The United States Dispensatory has the following statement regarding tincture of opium which has precipitated

"Laudanum when long kept with an occasional exposure to air becomes thick from evaporation of a portion of the alcohol and the deposition of solid matter. If given in this state, it often acts with unexpected energy, and death has resulted in infants from doses which would have been entirely safe if the tincture had been clear" (2)

The method of preparing tincture of opium as outlined in the French Codex (1908) is somewhat different than the U S P X method. The French tincture is manufactured by dissolving an aqueous solid extract of opium in 70 per cent alcohol. The solid extract of opium is prepared as follows. Opium is cut in fine pieces and macerated in distilled water. This is expressed, and a second extraction made. The two liquids are then combined and reduced to a soft extract on a water-bath. This extract is then dissolved in distilled water and filtered. The filtrate is again reduced to its former consistency (3).

In order to develop a method whereby the objectionable precipitate in tincture of opium might be eliminated, several experiments were tried. The results of quite a number of experiments can be reduced to three, which will properly illustrate the procedure.

The following formula was used

Granulated opium	100 Gm
Paraffin	50 Gm
Alcohol	200 cc
Water distilled, a sufficient quantity to make	1000 cc

The tincture was prepared by dissolving the proper amount of opium in hot water. We allowed this mixture to stand over night, filtered the liquid, and added water distilled *q s* to make 250 cc. This aqueous mixture was heated on the water-bath until it was reduced to about 150 cc. This concentrate was cooled, and paraffin added. The mixture was then heated just sufficiently to melt the paraffin, and the whole was thoroughly mixed. After the paraffin had solidified, the product was allowed to stand twenty-four hours. The pellicle of paraffin was pierced, and the liquid poured off. The paraffin was washed with sufficient dis-

* Section on Practical Pharmacy and Dispensing, A. Ph. A., Portland meeting, 1935

1 From the Control Laboratories, Eli Lilly and Company

tilled water to make a total of 800 cc This liquid was filtered, and 200 cc of 95 per cent alcohol added This resulted in a fairly clear product

Tincture of opium made by this method after aging thirty days was clear One can easily see through 20 millimeters of the liquid

Sixty days' aging, with subsequent filtration, further improved the clarity of the product, and gave us a brilliant tincture

This procedure does not entirely inhibit the formation of the precipitate However, the precipitate that forms on the sides and bottom of the bottle was more or less of a scaly nature, and while it will flake off and mix with the contents of the bottle, yet it does not produce a turbid and unsightly tincture A product made by this method could be used in dispensing very easily, merely by decanting the clear portion

A further improvement on this formula can be made by changing the procedure slightly An example of such a formula follows

Granulated opium	100 Gm
Paraffin	50 Gm
Alcohol	200 cc
Water, distilled a sufficient quantity to make	1000 cc

The granulated opium was dissolved in about 200 cc of hot water, and allowed to stand overnight, filtered, and the filter paper washed with water *q s* to make about 250 cc

This aqueous mixture was then heated to 77-80° C, and kept at this temperature until it was evaporated to about one-half volume The paraffin was added to this, and allowed to melt The mixture was then thoroughly beaten and allowed to cool

After the paraffin had solidified, the pellicle was punctured and the liquid drained off The paraffin was washed with enough distilled water to make a total of 800 cc This was then filtered, and 200 cc of alcohol mixed with the filtrate

A portion was assayed, and the product diluted according to this assay A sample of this mixture after aging 7 days and then filtering had much less precipitate in it than one made by the regular U S P X method

A sample that was aged 30 days and then filtered showed improvement in the amount of precipitate thrown down upon longer aging

Sixty days' aging was found to further reduce this quantity of final precipitate

A sample of tincture that had been made by this method and aged sixty days showed only a very small amount of precipitate This precipitate adhered to the bottom and sides of the bottle as a hard scale, which could be shaken loose, but immediately settled to the bottom Therefore, such a tincture could be used for dispensing very conveniently, as the clear product could be decanted readily from any dispensing bottle

A tincture that was made according to the U S P X method contained a very thoroughly suspended and muddy precipitate which, even after long aging, did not allow a clear portion to be decanted

These two groups of experiments were followed by a third one, in which the same procedure was followed, except with a change at only one point At the

stage where the aqueous mixture of opium was reduced, the liquid was boiled for 15 minutes, and allowed to stand overnight, instead of being maintained at a temperature of 77° to 80° C. The result of this procedure was even better than the previous experiments. The amount of precipitate in this tincture was materially reduced, and at the end of eighteen months had not shown any further sedimentation. An assay on the clear supernatant liquid showed no loss in potency during this period.

This experiment was repeated with opium from several different shipments in order to be sure that such a formula would be adaptable to the material usually obtained in commerce.

It has been suggested by some that caramel should be added to tincture of opium as a coloring agent. In order to prove that this might have some effect on the resulting precipitate, samples of all experiments were colored with a small amount of caramel. The results of all such experiments performed were the same, namely, a small amount of additional caramel to any of these tinctures increases the amount of precipitate, or at least the character of its formation. In all cases in which caramel had been added to the tincture, these products showed a fine, well-suspended precipitate which had no tendency to coagulate, and was very easily mixed by shaking. It is interesting to note that the samples colored with caramel showed the same easily suspended, and muddy precipitate that is characteristic of the U S P product. Therefore, the addition of caramel is objectionable.

CONCLUSIONS

Since a tincture of opium made by the method outlined above is free from this large amount of light, muddy precipitate that is characteristic of the U S P product, we suggest that the formula for tincture opium U S P be modified slightly so that a product can be made which will remain clear for a considerable period of time. Furthermore, the use of caramel as a coloring agent causes an additional precipitate, which is undesirable.

A STUDY OF COMPOUND CRESOL SOLUTION *

BY K L KAUFMAN¹ AND C O LEE^{2 3}

Compound Solution of Cresol was first made official in the U S Pharmacopœia VIII. It has been continued in the succeeding revisions with but slight changes in the formula and procedure.

As a germicide the use of cresol is attributed to German workers (1). The fact that it is soluble in a soap solution has led to its wide use in such preparations which are well known by the official titles and various trade names.

DIFFICULTIES WITH THE OFFICIAL FORMULA

Compound Cresol Solution has been regularly assigned to our students to make for a number of years. We have observed that they find it hard to prepare. Also that the formula of the U S P X is more difficult to make than that of the U S P IX. We have come to the conclusion that the present official formula is objectionable for the following reasons:

- (a) The time required for completing the reaction and effecting a solution is too long
- (b) Two alkalis are used where one is sufficient
- (c) Possible loss of cresol, and changes in the product due to continued heating necessary to complete the reaction

IMPROVED PROCEDURES STUDIED

As a result of our observations and experiences, with this preparation, we have sought to eliminate the major objectionable features in making it. In addition several other oils, having saponification numbers close to that of linseed oil, have been used in preparing the cresol solution. These have all been studied with respect to their phenol coefficient, surface tension, ease of manufacture, penetration power, and general appearance.

SPEEDING UP THE REACTION

The liquor was prepared according to each of the formulas of the U S P VIII, IX and X. From the standpoint of the time required the U S P IX formula was the most desirable. It contains but one alkali and permits the use of a small amount of alcohol which, we assume, catalyzes the saponification reaction.

In an effort to determine the accuracy of our assumption several samples were prepared in which alcohol was added in varying amounts and at various stages in the process. When no alcohol was used the time required for complete saponification was much longer.

An effort was also made to speed up the saponification reaction by substituting methyl alcohol and chloroform for ethyl alcohol. The last traces of chloroform were hard to remove and methyl alcohol proved to be no better than alcohol so the use of these was abandoned.

THE USE OF OILS OTHER THAN LINSEED

It has been repeatedly suggested that the use of any suitable oil be permitted in making compound cresol solution. Such liberties with the official formula would raise questions as to the uniformity of the finished solutions for which the Pharmacopœia strives. Then too the germicidal value and other properties of the solutions made from the various other oils are unknown. For these reasons we concluded to study the effects of substituting other oils in the formula. Those used were expressed oil of almond, olive, corn, sesame, sunflower, peanut and soy bean oils. The saponification ranges of these are close to that of linseed oil which served as a control.

The results of our studies upon the compound cresol solutions made from these eight well-known fixed oils are given in Table I following. The samples were all prepared according to the formula and procedure which we have proposed later in this paper.

The results clearly indicate that any of the oils named yield good compound cresol solutions. The eight samples tested proved to be practically alike in all of the essential properties.

TABLE I

Sample No	Oil	Specific Gravity	Color	Effect of 1-250 Dilution	Phenol Coefficient * <i>B. Typhosus</i> <i>S. Aureus</i>		Penetration* 1-100 Dilution <i>S. Aureus</i>
19	Soy bean	1.026	Dark red amber	Slightly cloudy	2.40	1.75	None
35	Linseed	1.032	Reddish amber	Clear	2.30	1.80	0-0.2 mm
36	Olive	1.027	Amber	Clear	2.10	2.10	None
37	Peanut	1.027	Reddish amber	Clear	2.00	2.10	None
38	Corn	1.027	Light red amber	Clear	2.35	2.00	None
39	Almond	1.026	Light amber	Clear	2.65	2.45	None
41	Sunflower	1.025	Light red amber	Clear	2.30	2.00	None
42	Sesame	1.026	Light red amber	Clear	2.00	2.00	None

THE QUESTION OF SOY BEAN OIL

The use of soy bean oil in the manufacture of the official Compound Solution of Cresol has been urged by manufacturers (2), as well as independent workers (3). They have argued that it is much cheaper and makes a product which is, in every way, comparable to the official product. The opposition has argued that soy bean oil yields a product which is too viscous, unsuited to easy dilution, and which gelatinizes upon cooling in the absence of excess alkali, or when potassium hydroxide is used alone (4).

These claims led us to make a special brief study of soy bean oil. Seven samples of 125-cc quantities of Compound Cresol Solution, using varying amounts and mixtures of alkalis, were prepared. The formulas are given in Table II following. The official procedure was followed.

TABLE II

Ingredients	1		2		3		Formulas 4		5		6		7	
Cresol	62.5	Gm	62.5	Gm	62.5	Gm	62.5	Gm	62.5	Gm	62.5	Gm	62.5	Gm
Soy bean oil	37.5	Gm	37.5	Gm	37.5	Gm	37.5	Gm	37.5	Gm	37.5	Gm	37.5	Gm
Potassium hydroxide	9	Gm	10	Gm	11	Gm	12	Gm	7	Gm	5	Gm	2	Gm
Sodium hydroxide									2.13	Gm	3.45	Gm	5.51	Gm
Alcohol	1.25	cc	1.25	cc	1.25	cc	1.25	cc	1.25	cc	1.25	cc	1.25	cc
Water to make	125	cc	125	cc	125	cc	125	cc	125	cc	125	cc	125	cc

OBSERVATIONS

1. None of these preparations gelatinized upon being cooled to 15° C.

2 All dilutions, even up to 1-250 were clear except formula 1 which was deficient in alkali

3 The use of mixed alkalies proved to be of no advantage

The objections raised to the use of soy bean oil in this preparation were not supported by our observations

The problem of gelatinization which has been reported by several workers has also been encountered by us but we were able to trace the difficulty, in every case, to the use of inferior grades of cresol Good cresol of U S P quality gave no trouble

A PROPOSED NEW FORMULA FOR COMPOUND CRESOL SOLUTION

While we have worked with the various other oils, previously named in this paper, after the manner described for soy bean oil, details of observations and results will be omitted here Suffice it to say that all yielded Compound Cresol Solutions of very good appearance and quality As a result the following formula and procedure for this preparation is proposed

COMPOUND CRESOL SOLUTION

Cresol	500 cc
Oil (any fixed oil mentioned in this study)	300 Gm
Potassium hydroxide	80 Gm
Alcohol	10 cc
Water, sufficient to make	1000 cc

Procedure—Put the potassium hydroxide into 80 cc of water When solution is about three-fourths complete, add the alcohol and stir until solution is effected Add this solution to the oil which has been previously warmed to about 60° upon a water-bath, and stir gently When saponification is complete, as shown by testing with water, in the usual way, or by appearance, add the cresol, in small portions with stirring Finally, remove from the water-bath cool and adjust the volume to 1000 cc with distilled water

The new formula has proved to be a great time saver We were able to complete the preparation easily, within fifteen minutes which is much less time than the average person takes to prepare the official formula For this reason also the losses and changes due to continued heating are minimized Students in manufacturing pharmacy were able to compound this formula with ease and success

SURFACE TENSION OF COMPOUND CRESOL SOLUTIONS

The Committee of Revision of the U S Pharmacopœia is interested in setting up dependable standards for its preparations With respect to Compound Cresol Solution there is considerable interest in surface tension specifications for it In Table III, on page 970, are the relative surface tension measurements of two different dilutions of eight samples of cresol solution The samples are the same as those given in Table I

The dilutions studied were 0.5% and 5% by volume These were selected because they are near those dilutions commonly employed in using this product They were made up with quantitative procedure The measurements were made by means of a Cenco-du Noüy Precision Tensiometer The instrument was carefully checked and calibrated in accordance with the instructions accompanying it (5)

TABLE III
Compound Cresol Solution

Sample No	0.5% Solutions		Compound Cresol Solution		5% Solutions	
	Observed S	T Temperature	Observed S	T Temperature	Observed S	T Temperature
19	30	33 28 0 degrees	34	60 28 5 degrees		
35	31	17 28 0 degrees	35	40 29 5 degrees		
36	29	75 28 0 degrees	35	12 29 5 degrees		
37	30	19 28 0 degrees	34	87 29 5 degrees		
38	30	50 28 0 degrees	35	33 29 5 degrees		
39	29	92 28 1 degrees	35	27 29 5 degrees		
41	30	72 30 0 degrees	34	92 30 7 degrees		
42	30	47 30 4 degrees	34	26 30 8 degrees		

The observed surface tension readings are in dynes per centimeter and are given as relative values only. They are the averages of several measurements upon each of the dilutions.

In conclusion we wish to suggest that it is our belief that a solution so well known and widely used as is Compound Cresol Solution deserves to be made with considerable exactness. This can be done, by using high-grade chemicals, and refined technique. Reasonable standards for purity of the finished product could then be worked out.

THE HOSPITAL AND THE PHARMACIST *

BY H C MCALLISTER ¹

With the evolution of hospital care and group hospitalization in this country, it has become necessary for the institutions to give more efficient service at a lower cost to the patient than was formerly the case. This is true from a professional as well as an economical point of view. Many institutions, especially those doing some non-profitable work, find it difficult to meet the economic demands which are being made of them at present. It is with these conditions in mind that the following observations are recorded. It is believed that they will very probably apply to a majority of the hospitals of the Southeast, and may suggest a method of remedying some of the conditions met in dispensing medication.

Many of the smaller hospitals are still operating with a "Drug Room" method of dispensing under supervision of a graduate nurse, who has had no particular training in this work. She is assisted by student nurses who refill supplies or stock preparations kept on the wards, as well as compounding the simpler prescriptions written by the Visiting Staff. The prescriptions which are too complicated to be filled by the nurses are sent to an outside pharmacy. This system obviously has a few advantages.

* Section on Practical Pharmacy and Dispensing A PH A, Portland meeting, 1935

¹ Pharmacist, Watts Hospital, Durham, North Carolina

- (1) Supplies can be obtained at any hour of the day or night
- (2) The operating personnel is practically no expense to the hospital

The disadvantages are

(1) Prescriptions are filled by unqualified persons with a great risk to the patient's welfare and the hospital's reputation. This is necessarily true where untrained, immature persons are allowed to refill stocks of potent drugs and compound prescriptions of a similar nature.

(2) Supplies are often allowed to become exhausted due to lack of foresight on the part of student nurses, whose duty it is to keep up the want list. This impairs the service of the hospital greatly.

(3) The students are usually rotated every four to six weeks so that when a student becomes proficient enough to manage the system she is replaced by a new student.

(4) Such a method is very expensive for the quality of service obtained. The handicaps of such a routine could be enumerated in great detail.

The first suggestion is, of course, the employment of a pharmacist. The type and size of the hospital must be considered before any definite decision might be made that it can support a pharmacist. Some comparative information may be gained from the experience of an institution that has had the services of a pharmacist for one year. The capacity of this institution is 225 beds, and it has an average of from 125 to 150 patients per day. This is slightly larger than most of the hospitals operating without a pharmacist but it can be easily seen from the following outline that smaller institutions cannot only afford but profit by the services of one trained in the art of manufacturing and dispensing.

As an experiment this hospital employed a pharmacist who relieved the nurses of all of their duties connected with the dispensing of drugs. The duties consisted of refilling such stocks as were kept on the wards, filling prescriptions, ordering drugs and the preparations of intravenous solutions. Under the system then being employed the plan proved to be very time-consuming. The average number of patients at that time was about 135 per day and the attending physicians wrote special prescriptions on their morning and evening visits. Many patients were medical cases and the number of special prescriptions, averaging between thirty-five and forty per day, was disturbing. Due to these special prescriptions valuable time was consumed with the medications of a comparatively few patients.

The first step to eliminate this variety of prescribing was to compile a formulary. A list was prepared from the most useful prescriptions employed by the Visiting Staff including some preparations from the U. S. Pharmacopœia, the National Formulary and the Recipe Book. Special efforts were made to include those preparations which were counterparts of certain popular proprietary preparations. The list was presented to the staff for their consideration, correction and revision. Promotion of these formulary preparations was done when the members of the staff called at the Pharmacy for information about other preparations. In order to accomplish this purpose, tact must be exercised in order not to antagonize the physicians in attempting to substitute official preparations for proprietary remedies, one or two suggestions should be made at a time. In this manner a splendid spirit of cooperation can be established between the physician and the pharmacist. Some preparations worked out by the pharmacist for the particular needs of the hospital proved to be of special interest to the staff. This interest was further stimulated at staff meetings which are held once a month. Papers are read at these meetings

concerning the new preparations to be added to the formulary Usually two or three preparations of the same nature are presented at each meeting and the merits and demerits of each are discussed This serves to acquaint the physician with the particular item under discussion Only basic drugs or preparations were submitted at these meetings After the formulary had been in use for six months the number of special prescriptions was reduced to ten or fifteen a day This allowed several hours of extra time which could be devoted to manufacturing, replacing supplies, studying, etc It also saved much medication since special prescriptions when returned from the wards are discarded

Shortly after the formulary was introduced the hospital adopted a flat-rate charge Included in the flat-rate a definite sum was charged for the room and ordinary drugs, dressings, X-rays, laboratory work, etc The term ordinary drugs was construed to mean drugs contained in the formulary This proved to be most successful, since the physicians, interested in keeping the cost of hospitalization as low as possible for the patient, would use stock preparations when the basic ingredients of which were analogous to those of proprietary preparations The medication to the charity patients was limited to stock preparations as far as it was possible On several occasions it was found that the formulary was too limited in its scope and additions were made

After using the list for some months it was found to contain some preparations for which there were no calls These had found their way into the list because of their popularity elsewhere This would indicate that it is necessary to compile an individual list for the particular needs of the institution

Records were kept including (1) the number of times the "special preparations" were called for, *i e*, those preparations not included in the U S P or N F but those that had been used in the hospital or in other institutions, (2) the name of the doctor prescribing these preparations If the frequency of prescribing a certain preparation was below a definite figure in a justified period of time the attention of the physician ordering it was called to a similar preparation, which was contained in the formulary In this way it was possible to eliminate the rarely used preparations, and further standardize the prescribing There are certain types of medication for which the indications for use are seldom Consideration must be given to this type of medication lest it be deleted without warrant, due to its infrequency of use and to overlook this fact will defeat the purpose of much hard work

Some idea as to the amount saved in stabilizing the prescribing and by careful buying may be gained from the following

	1933	1934
Cost per patient day for drugs	\$0 1421	\$0 1138
Cost per patient day for misc	0 0304	0 0151
	<hr/>	<hr/>
Total cost per patient day for Pharmacy	\$0 1725	\$0 1289

If the cost of the pharmacy for 1934 is figured on the basis of the cost per day for 1933, a saving of 26 43% on operation is noted A comparison of the inventory of the two years adds to the total potential savings, since that of 1934 was about 50% over the inventory of the preceding year The cost per patient day considering this increase in inventory is reduced to \$0 1186 which indicates a total potential saving to the institution of 31 18%

The question of salaries arises in figuring the total cost of operating the pharmacy Under the old system one-half of the graduate nurse's salary was included in the cost of maintaining the pharmacy and the remainder was charged to nursing service Under the new system, the entire salary of the pharmacist, as well as that of the employee who did cleaning, etc., was charged to the Pharmacy The salary paid was based on the average paid in the community, and included full maintenance in the institution The hours spent in work were shorter than those of other pharmacists in the neighborhood

It is believed that these conditions will apply in varying degrees to every institution averaging over fifty patients per day, and that such institutions can well afford the employment of a pharmacist for the following reasons

- (1) Nurses are relieved to do nursing duties
- (2) Closer coöperation between the institution and the doctor can be secured
- (3) Dispensing is standardized and the welfare of the patient as well as the reputation of the hospital is protected
- (4) A pharmacist can operate the pharmacy at a lower cost (including salaries) than can a person untrained in the art of dispensing

THE VISIBLE PRESCRIPTION DEPARTMENT *

BY GEORGE W FIERO ¹

Probably the most modern development in retail pharmacy is the so-called "open front" or visible prescription department Not that the idea is particularly new (Horton & Converse, Los Angeles, have had a completely visible prescription department since 1920), but it is now becoming quite popular It is no doubt a step in the right direction, since it emphasizes the professional nature of the pharmacist, however, one should be sure of his step before making such a radical change

Numerous articles have appeared in the drug journals praising the visible prescription department Some pharmacists have placed their prescription department in the window so that it is visible from the street (1), others have a completely visible prescription department within the store (2) and others have a prescription department wherein the actual compounding of prescriptions is not completely visible (3)

Silsby (4) points out that the physicians he interviewed were unanimous in their disapproval of a prescription department in which the patient could see the actual compounding It is important that the pharmacist should have a good professional relationship with the physician, therefore, his opinion of this type of prescription department should be quite important In order to determine this opinion, a questionnaire was mailed to one hundred physicians The names of these physicians were not merely taken from a directory, but were obtained from several active prescription pharmacists (both open and concealed prescription departments) in various parts of Buffalo The list included the physicians who wrote the most prescriptions The result of the survey is as follows

* Section on Commercial Interests, A. P. H. A., Portland meeting, 1935

¹ University of Buffalo, School of Pharmacy

Number of returns, 40, 40%

Favoring visible department, 14, 35%

Not favoring visible department, 36, 65%

Among the reasons given by those favoring a visible prescription department were "It will give an excuse for a general merchandise store to call itself 'Prescription Pharmacy,' anything which emphasizes the professional side of pharmacy is favorable, it raises the standard of the entire profession, it is not only educational, but shows that the pharmacist is a skilled professional man. The customers can see the care, time and skill which the pharmacist devotes in preparing a prescription, it will promote a greater degree of confidence and respect for the pharmacist. They can see that the prescription is not all water and they will be satisfied with the price charged. It will dispel the secrecy of a prescription, there is nothing which a pharmacist has to hide. It will incline the pharmacist to make up fresh solutions, rather than merely pour them from a stock bottle. The pharmacist must keep the prescription department clean and orderly."

Among reasons given by those not favoring a visible department were "If a simple drug is prescribed, the patient, seeing it compounded, will feel that nothing is being done and will lose confidence in his physician, seeing the prescription compounded will create distrust and loss of confidence in the physician. It would be disconcerting to the pharmacist, make him nervous and take his attention from his work, it would make the patient apprehensive and confused, seeing poison labels, narcotics, etc., would cause fearfulness. The laity is unable to judge the ability of a pharmacist, as they know nothing of compounding, some prescriptions require consultation with the physician. In some cases (e g., solution of potassium iodide) the compounding is not in accord with the price, the public may lose confidence, if the pharmacist merely pours from one bottle to another, or, if he merely replaces the proprietary label with his own. Hand-filling of capsules and pills is not always helpful, patients know too much about drugs now, they endeavor to read their prescriptions and reading a proprietary label may lead to self medication. It is unwise to permit some patients to know what goes into the prescription, patients, seeing what goes into the prescription, may get a wrong idea of their ailments—if they see a bromide, they may arrive at a false conclusion, for this reason many physicians dispense some medicines. The department should always be open for inspection, but not visible. The patient may conclude from a prescription containing a proprietary preparation as a vehicle that he is getting a 'patent medicine'."

The results of this survey would indicate that the physicians are not in favor of an open front prescription department in which the actual compounding may be observed. Probably a more satisfactory arrangement would be to have a prescription department with the actual compounding not entirely visible to the patient.

A HISTORY OF DENTIFRICES ^{*1}

BY MARTHA E FOULK AND ELIZABETH PICKERING

The history of dentifrices is a striking example of the persistent marketing and use of preparations containing substances known by the medical profession to be harmful. The literature abounds in advertisements lauding dentifrices, and in medical criticisms of their ingredients. It is true that the most dangerous, for example, sulphuric acid for whitening the teeth and powdered glass as a powder, have fallen into disuse. Dentifrices constitute such a substantial proportion of the toilet preparations sold by pharmacists, and the latter, as well as the general public, are to day presented with such a multiplicity of conflicting statements regarding the various market products that survey of the ingredients used in previous centuries may be of interest.

The Council on Dental Therapeutics defines dentifrices as preparations (pastes, powders and liquids) which aid in the removal of debris from tooth surfaces. From almost the earliest recorded writings on the subject, dentifrices have taken these three physical forms. Such preparations were first used chiefly to whiten the teeth, that is to beautify, but even as early as the middle of the first century Damocrates, a Greek physician, considered cleanliness the indispensable condition for avoiding disease of the teeth and gums. In any case the covering or removal of unwholesome breath was undoubtedly an important object as practically all formulas included one or more perfumes or deodorant materials.

Powders were composed of a great variety of substances, usually insoluble and often abrasive or astringent in character. In the 19th century insoluble powders were considered objectionable because they tended "to accumulate in the space formed by the fold of the gum and the neck of the tooth, and thus present a colored circle." To hide this, many tooth powders were colored red with bole Armenian.

Pastes as made then were of the same fundamental composition as powders but altered by the addition of a gum or a "pasty" substance, or often by addition of a liquid such as honey, and were unstable. It was not until early in the 20th century that the modern stable tooth paste or dental cream, of very much more complex constitution, was produced.

Mouth washes were sometimes of very simple nature, such as wine, asses' milk, etc., but more frequently were composed of very many substances and thus recall the "shotgun" remedies of the early ages. The active ingredients appear to be without exception acidic or astringent. These preparations were often claimed to be effective in "strengthening" the teeth and were, therefore, probably also used in the treatment of diseases of the gums.

Throughout the Middle Ages these various forms of dentifrices changed but little, and their ingredients were usually of indefinite composition and often of doubtful efficacy, or injurious. A partial list of ingredients is as follows:

Magistery of Pearls, Dragon's Blood, mastik, myrrh, pineapple, flowers of pomegranates, spring-water, gum of guaiac, Peruvian balsam, aqua vulneraria, cinnamon water, spirit of cochlearia, powdered crab's eyes, orris root, cuttlefish bone, burnt roots of birthwort, white salts, honey,

* Section on Historical Pharmacy, Portland meeting, 1935

¹ Library, E. R. Squibb & Sons, Brooklyn, N. Y.

burnt land snails, unwashed wool burnt with salt, sal ammoniac, costus, pellitory, pepper, emery, talcum, pumice, alabaster stone, coral powder, burnt purple shell or ashes of the murex, burnt trumpet wheels, pennyroyal, sage seed, Saint John's bread, gall-nuts, ashes and powder of stag's horn, ashes of the heel of an ox, and of the feet of a goat, goat's milk, burnt eggshells, salt, powdered skin of the radish asses' milk, alum, cedria, burnt figs, burnt gypsum, verdigris, vinegar wine, meerschaum, nitre, burnt orris root, aristolochia and reeds, moschata, cubeb, juniper seeds, root of cyperus, rosemary leaves, cream of tartar, armenian bole

During the 18th and 19th centuries a greater variety of definite chemical compounds were incorporated in these forms of dentifrices. Also, in 1868, there appeared a "new and improved form of tooth powder," the tooth tablet. This was supplied in the form of a cake from which one tablet at a time, sufficient for one brushing, could be broken. Tooth soaps, made by adding about one-third by volume of powdered soap to an ordinary tooth powder, had their vogue toward the end of the 19th century. At this time, as a result of the search for a means of preventing dental decay and bad breath, the trend toward dentifrices and mouth washes having antiseptic properties developed.

It is our purpose in the following, so far as is possible, to classify early dentifrice ingredients according to their mode of action, and to show how the members of those classes varied from antiquity up to the end of the 19th century.

The use of abrasives is as old as dentifrices themselves. Chemically, abrasives have consisted usually of phosphates, carbonates, silicates and carbon but the form and sources of these compounds have varied greatly.

Ashes obtained by calcining bones or portions of animals were much used for several centuries. One of the favorites was the ash obtained by burning the head of a hare, mentioned alike by Hippocrates, Pliny and others. At times this was combined with the ashes of mice and substituted by the ashes of the heel bone of an ox, the teeth of a dog, stag's horn, etc. Ashes from such sources doubtless consisted chiefly of tricalcium phosphate, to-day considered too highly abrasive for use.

Probably the most effective abrasive substance, which appears to have been used but little, was the "very white glass, similar to crystal, powdered and mixed with spikenard," which Scribonius Largus, physician to Emperor Claudius, recommended. Pumice was likewise a constituent of the 14th-century powders of Gaddesden and of de Chauillac mentioned above. It was condemned as harmful by Berdmore in 1769 and by James in 1814, but it appeared as a constituent of a dentifrice marketed in this country as late as 1879, which was moreover claimed harmless by its maker. Ashes of vegetable products, mentioned below, would be like glass and pumice, of silicious character.

Vegetable substances that were "burnt" were used as abrasives in ancient times. Galen (131 A. D.) advised that teeth be rubbed with dried figs burnt and pounded with spikenard and honey. Charcoal or ashes of other vegetable products such as wood, tobacco, cigars, bread, etc., were frequently used during the 19th century and carbon or soot in admixture with salt and snuff was much used. Charcoal from such sources was usually thought harmful, but a dentifrice consisting of it and quinine (21) appeared in the French Pharmacopœia of 1866. Because of its chemical identity it is pertinent to note in this connection that Aristotle considered the diamond dangerous to keep in the mouth as it would inevitably crack the teeth. It is doubtful if he referred to this as a mode of cleaning the teeth.

Calcium carbonate in its several forms has been continuously used as a dentifrice from very early times, on account of its mild abrasive action and its value as an antacid. Hippocrates (430-377 B. C.) discusses the use of powdered marble or white stone, Pliny, burnt eggshells, de Chauillac (1368 A. D.), powdered sea shells.

Powdered cuttlefish bone, which consists chiefly of calcium carbonate, was an ingredient of a powder recommended by Gaddesden of Oxford, in the 14th century, by Guy de Chauillac (1300-1368), by Anton Nuck (1650-1692) and later by Ruspini in 1760. The French Pharmacopœia

in 1850 contained a dentifrice recommended by Canton containing cuttlefish bone and Sir Edwin Saunders, Court dentist to Queen Victoria in 1851, also recommended one containing it. Powders for general use, used in London in 1872, contained cuttlefish bone and small amounts of it may still be constituents of them to day.

Seventeenth century dentifrices often contained powdered red coral, as did the dentifrice included in the French Pharmacopœia of 1850.

Thereafter chalk was usually substituted and was frequently used alone. It was recommended by John Greenwood, dentist to George Washington, who wrote him as follows: "If your teeth grow black, take some chalk or a pine or cedar stick, it will rub off." In Philadelphia in 1784, when tooth brushes were not known, people rubbed their teeth with a chalk rag. In 1842 the English used a dentifrice consisting mostly of white chalk and the largest constituent of Dr. Bridge's tooth powder used in 1854 in Brooklyn was prepared chalk. Equal proportions of prepared chalk and orris root made a good dentifrice (1854). Chalk was the main constituent of Dr. Chapin Harris' dentifrice (1850), Sir Edwin Saunders', Dr. Brown's (1867) and several powders used in London in 1872. Further references to this ingredient are unnecessary—it is the most extensively used abrasive in present day dentifrices.

Salt was used by the Chinese, the Greeks and the Romans in dentifrices, and was mentioned by Paul of Ægina. Later Avicenna (980–1037 A. D.), Guy de Chauliac and Giovanni of Arcole included salt in their dentifrices. Table salt along with other saline substances was considered undesirable in dentifrices in 1814 and again in 1847. In 1902, however, Greve gave two formulas for dentifrices, each of which contained 70 parts of a saturated solution of sodium chloride and today sodium chloride is still recommended by some for regular use.

Toward the end of the 18th century, orris root was used extensively. Ruspini mentions it in 1750. It continued to be a constituent of dentifrices through the 19th century and was present in Dr. Bridge's tooth powder (1854), Dr. Chapin Harris' dentifrice used in Baltimore in 1850, Sir Edwin Saunders' powder and Dr. Brown's powder (1867). As late as 1898, Dr. Willoughby D. Miller, an American dentist who practiced in Germany, recommended a tooth powder containing pulverized root of orris. It does not now appear to be extensively used, but appears in some formulas.

Reviewing briefly the tendencies of change in this field, it will be seen that in ancient times very abrasive substances were used—such as silicates, tricalcium phosphates, etc., and that their dangers were likewise very early recognized.

During the 11th century, Avicenna (980–1037 A. D.) in his book "The Canon" said that hard tooth powders injured the dental substance and must be avoided. In 1769, Berdmore warned that dentifrices that whitened the teeth by mechanical grinding were always composed of pumice, emery or some other cutting powder and were extremely pernicious as they destroyed the enamel. However, when theories about the teeth changed, advice about the use of abrasives changed. In 1782 when many believed that the enamel of the teeth could be regenerated and it was of no consequence that it be worn away by the use of abrasives, a renowned surgeon, Theden, recommended the use of them.

After the excessive use of abrasives in dentifrices during the first part of the 19th century, they were condemned strongly toward the end as being the cause of decay and irritation. This was probably due to some extent to the work of James, who in 1814 experimented with abrasives by placing teeth in a vice and rubbing them with powders containing coral, pumice, emery, etc. He found that one hour's application of them with a brush removed the enamel from the tooth. He stated his results thus:

'From this fact we may ascertain pretty nearly the time required for the destruction of enamel under the daily use of powder. Suppose such dentifrice be used for 10 seconds each day, by this calculation, we see it requires but one year's perseverance in its use to ruin the teeth.'

Bell considered that frequently the cause of dental decay was the abrasion of the enamel produced by coarse, gritty materials in tooth powders. Burchardt (1898) also discussed the irritant effects of abrasives such as charcoal and pumice and recommended the use of precipitated chalk or of magnesium carbonate or hydrate.

Because the original purpose of dentifrices was to beautify, there were, among the earliest used preparations, many for the whitening of teeth by chemical means. Some of these were of unknown and indefinite composition, as for example, the excrement of the bat used by the Chinese.

in a powder The Emperor Huang-Ti, called the founder of Chinese medicine, who lived from 2698-2598 B C, described two powders for whitening teeth, both of which contained musk

The majority of whitening agents used have been acid in character One of the most harmless used in early times was vinegar—mentioned by Hippocrates (460-377 B C) and subsequently by others From Strabo we learn that the Cantabri and other peoples of Spain used to clean their teeth with old urine which was kept for the purpose in suitable cisterns

To Lazare Riviere (1589-1655), professor at the University of Montpellier, goes the doubtful credit of first suggesting sulphuric acid for this purpose "If the teeth be very dirty, sulphuric acid might be used pure, otherwise one mixed it with mel rosatum or with water" The present day whitening agents which consist of mineral acids such as hydrochloric, cannot, therefore, be considered original or unique

After such treatment it is not strange that toward the end of the 18th century acids fell into disrepute as ingredients of dentifrices Among the critics were Thomas Berdmore (1769), dentist to George III, and James of Boston (1814), both of whom stated in no uncertain terms that whitening dentifrices, without exception, owed their action to the presence of acid by virtue of which they destroyed as well as cleaned the enamel

Tartaric acid, first mentioned as an ingredient of dentifrices by Nuck (1650-1692) was later replaced by Ruspini (1750) by the less acidic potassium bitartrate, cream of tartar This was an ingredient of a dentifrice included in the French Pharmacopœia of 1850 and was present with an equal weight of powdered lactose in the acid dentifrice given in the same pharmacopœia of 1866 With respect to the earlier formula, the statement appears that this salt may ultimately injure the enamel

Although it was well recognized that its continued use would injure the teeth, chloride of lime appeared in dentifrices of this period and was recommended, in a mixture with 2 parts of powdered red coral, for brushing yellow teeth It was considered to have disinfectant and deodorizing properties

Toward the end of the 19th century, phenol was recommended by Frey as an ingredient of a dentifrice Benzoic acid was recommended by Miller in a dentifrice in 1898, tannic acid benzoic acids and ortho-benzoic acid by Greve in 1902

Ancient dentifrices, particularly washes, contained astringent substances and these were also sometimes included in powders Alum was one of the earliest used of such substances and was mentioned by Paul of Ægina (625-290 A D), by Scribonius Largus who recommended it rubbed on the teeth three times a month and by Rhazes (850-923) as a constituent of a cement to stop tooth decay It continued to be an ingredient of many dentifrices until late in the 19th century Myrrh was used for the same purpose during ancient times and in the middle ages Other astringents such as camphor tincture of rhatany and quinine sulphate came into use in the 19th century The last two still appear in formulas

Calcium carbonate as chalk was first used for its abrasive action but by the middle of the 19th century its value as a neutralizer of mouth acids was recognized For this purpose it was sometimes allowed to remain on the teeth over night

Blondeau, a pharmacist, is given the credit for introducing alkaline salts in dentifrices before 1836 A dentifrice of magnesium subcarbonate in combination with cocoa butter appeared in France in 1847, and preparations containing magnesia and magnesium carbonate, shortly after A suspension of magnesium hydroxide was recommended as an antacid in 1898

Another alkaline salt recommended at this time was sodium bicarbonate which is also to some extent still in use in antacid dentifrices

Soap came into use in the 19th century and has since been an important ingredient of creams and the subject of much controversy regarding its effects on the gums

It must be recognized that the application of dentifrices at the present time is far different than in previous centuries Although the relationship of cleanliness to tooth preservation was early recognized and Giovanni in 1484 recommended cleaning of the teeth after every meal, this practice was certainly not general Dental education among laymen and the general advance of hygienic knowledge has resulted in a great increase in care of teeth which are now brushed daily or

oftener by a large proportion of the population. The heroic treatment given by many of the older dentifrices was possible only because they were applied at infrequent intervals. Along with the change in frequency and mode of application have developed the modern dental creams and powders, better adapted by physical form and the character of their substituents to produce and maintain dental hygiene without injurious effects on the teeth or gums. These, it is true, contain in some instances the very abrasive and acid substances mentioned above but usually only when the product is to be used in certain special conditions and with the advice of a dentist.

During the first third of the 20th century the relative importance of the various types of dentifrices has undergone considerable change. Liquids or solutions have been sharply differentiated into those intended to whiten the teeth and into the antiseptic mouth washes. The first class, as always, was uniformly acid. Investigations have shown that many of these contain the mineral acids, hydrochloric and sulphuric, and are distinctly harmful to the teeth. Somewhat less objectionable are those which contain the organic or so-called fruit acids.

Mouth washes containing various antiseptic ingredients have been extensively advertised and sold but it is now recognized that only extremely active disinfectants can be expected to have any action on the mouth bacteria under the conditions of use. These preparations, however, continue popular for the purpose of improving the breath and removing that bad taste.

The modern toothpaste or cream, welcomed on account of its convenience, palatability and stability, rapidly became a best seller. The first preparations of this type contained the more severe abrasives recommended at the time, such as tricalcium phosphate. Other abrasives which have been considered are magnesium phosphates, calcium fluoride, barium sulphate, silica, calcium and magnesium sulphates, etc. These and many others have been investigated and the majority abandoned for various reasons. Experience has shown the consumer that extremely abrasive creams are not suitable for continued use. Generally chalk or precipitated calcium carbonate has satisfactory cleansing action without injurious effects on the enamel, and it is therefore to-day the polishing agent most frequently present in pastes intended for general use, as opposed to the abrasive creams intended for prescription use.

A good polishing agent, but chiefly valuable as an antacid, magnesium hydroxide or milk of magnesia first appeared as an ingredient of pastes in products sold locally in Detroit and San Francisco and soon thereafter in a nationally advertised cream. The insolubility of this base gives to creams containing it the ability to neutralize mouth acidity without conferring on them the high alkalinity of the earlier alkaline creams. Magnesia dental creams now comprise a most popular type of dentifrice.

The scope of this paper does not permit the discussion of numerous ingredients in addition to those necessary for stability, used in creams. Attempts have been made to render these antiseptic by the addition of strong oxidizing agents, such as peroxides or other compounds inherently bactericidal. Recalling the use of chlorinated lime in the past, potassium chlorate was at one time an ingredient of a popular toothpaste. In 1931 Chilson still considered it a common ingredient of pastes. Disinfectants are now, however, infrequently added to pastes, except for the pur-

pose of stabilizing the paste, it having been recognized that they, like washes, can hardly be effective in the manner applied

The tooth soaps common during the latter part of the 19th century declined in importance with the rise of the toothpastes and are now little in evidence. In spite of the extended controversy over its dangers and advantages, soap, however, has continued an important ingredient of dentifrices. Powders, so important during past centuries, became much less so after the development of pastes. It has been said that recently, especially during the last year, the sales of pastes have declined in favor of powders. According to a survey made by *American Perfumer*, however, sales of pastes still greatly predominate, the sales of powders in 1934 representing only about 8% of the total.

Modern dentifrices, in whatever physical form, are quite complex as compared to those of the 18th and 19th centuries, and indeed at times approach the complexity of those of the ancients. In contrast to them, the individual constituents of present dentifrices, particularly of creams, are as a rule necessary to the stability of the preparations.

The authors are indebted for the above facts to the books listed in the bibliography and to many others which contained no additional information.

CALIFORNIA FAIR TRADE ACT *

BY IRA J DARLING, M A, LL B ^{1 2}

The anti-trust law of California, passed in 1907, is popularly known as the Cartwright Act. In the act a trust is defined to include a combination to increase the price or prevent competition in the sale of merchandise or to fix any standard or figure, whereby its price to the public or consumer shall be controlled (Stats 1907, page 984, ch 530). Such a trust is forbidden and very severe penalties are prescribed.

Statistics are not readily available to show what attempts were made to enforce the California anti-trust law in the two years following its enactment, but it is doubtful whether it was ever sternly enforced in all its rigor.

In its original form the California anti-trust law absolutely forbade any kind of a price setting agreement. It was clearly based upon the economic theory that the general welfare would be promoted by free and unlimited competition. It was enacted at a time when it was believed that an industrial system saturated with competition would automatically result in well-equipped factories, an efficient system of distributing the manufactured products and room for an unlimited number of small retail outlets with an ever-increasing rate of turnover. The law of supply and demand was considered adequate to adjust prices. *Laissez-faire* was the slogan.

In some magical way the energetic California competition was to make it possible for all the retail outlets, the numerous small drug stores as well as the large ones, to have customers who had the purchasing power to maintain indefinitely a high rate of turnover with a healthy mark-up. Now these California customers were mainly people with pay envelopes, salary checks or those receiving incomes

* AMERICAN PHARMACEUTICAL ASSOCIATION, Portland meeting, 1935

¹ Member of the California Bar and instructor in Accounting and Laws of Pharmacy, College of Pharmacy University of California.

from rents or interest The amount received by customers in wages, salaries, rent and interest was not equal in amount to the selling price of the articles offered for sale It was not equal to the selling price, never has been, and the California Legislature, by the enactment of an anti-trust law could not make it equal The amount received in wages, salaries, rent and interest not being equal to the total selling price of the products offered for sale, some of them, obviously, had to remain unsold, and there was "overproduction," or, to state it more accurately, there remained the lack of purchasing power

Furthermore, the larger concerns who had reserves of capital and had access to favorable markets began cutting prices in order to get rid of their stock The small stores, of course, had to cut prices likewise to meet the competition, but many stores, especially the small ones, could not afford to take the loss and failed

When the California Legislature met in 1909 it was faced by the ever present and sorrowful fact that purchasing power did not equal selling price, and that good management and lusty competition had not succeeded in making it equal At that session the Legislature decided to reverse some of its economic theories in order to try to solve the chronic problem that has driven sales managers to early graves while production managers have been able to take merited vacations So, in 1909, there was adopted a sweeping amendment to the Cartwright act of doubtful constitutionality In part the amendment provided " No agreement, combination or association shall be deemed to be unlawful the object and business of which are to conduct its operations at a *reasonable profit* or to market at a reasonable profit those products which cannot otherwise be so marketed " (Stats 1909, page 593, ch 362) In other words, if a contract sets a minimum resale price, and it merely assures a reasonable profit, and if there is no other way of selling the product at a reasonable profit, then the contract is lawful But what did the Legislature mean by a "reasonable profit?" Similar words in a Colorado statute were held to be so vague as to be unconstitutional, in the opinion of the United States Supreme Court in 1927 (Cline vs Frink Dairy Co , 274 U S 445, 47 Sup Ct Rep 681) However, in the eighteen years intervening, the constitutionality of the 1909 amendment was not questioned by the California courts

If the "reasonable profit" amendment of 1909 was unconstitutional, then it is probable that the original anti-trust law remained in effect However, the California courts construed the anti-trust law as though the amendment were valid so as to permit contracts for what was claimed to be a reasonable profit

The anti-trust law of 1907, the "reasonable profit" amendment of 1909 and the several bulky volumes of fine-printed statutes since then had all failed to usher the hard working retail druggist of California into the golden land of eternal prosperity where red ink is unknown In 1931 the rate of turnover was not what it should be, it was hard to maintain a respectable mark-up Customers just didn't seem to buy enough goods at the proper prices Sometimes it was hard to pay the rent Many small stores resorted to bankruptcy and the bankrupt stock was bought up and sold by some of the inconsiderate chain stores at cut-throat prices, even below the wholesale price

The Legislature sought to remedy this situation in 1931 by the passage of the Fair Trade Act (Stats 1931, page 583, ch 278), which definitely abandons the "reasonable profit" test, and makes resale contracts legal regardless of whether or

not the price named is one that will render the buyer or seller a reasonable profit, or more or less than a reasonable profit, or none at all. Such contracts need not be limited to forms of business that cannot otherwise be conducted at a profit. The California Fair Trade Act provides in part

'No contract relating to the sale or resale of a commodity which bears, or the label or content of which bears, the trade mark, brand, or name of the producer or owner of such commodity and which is in fair and open competition with commodities of the same general class produced by others shall be deemed in violation of any law of the State of California by reason of any of the following provisions which may be contained in such contract

"1 That the buyer will not resell such commodity except at the price stipulated by the vendor

"2 That the vendee or producer require in delivery to whom he may resell such commodity to agree that he will not, in turn, resell except at the price stipulated by such vendor or by such vendee "

Perhaps the troubles of the retail merchant were over. Perhaps!

In spite of the Fair Trade Act of 1931, sad but stern history tells us that prosperity did not come to California in the two years following 1931. By the time the Legislature of 1933 met it was painfully evident that the Fair Trade Act had not ushered in an era of abundance. As far as the retailer was concerned prosperity was still "around the corner," and he had decided that the world was at least an octagon.

One trouble seemed to be that the contract signed by the manufacturer and retailer was binding on no one except the parties who signed it. There were many ways of evading the purpose of the Act.

A competitor of the person violating the contract could not take any action to enforce it. The contract could not be enforced by some one who had not signed it, unless it stated that it was made for the benefit of that person, and it could not be enforced *against* some one who had not signed it. It was simply a private arrangement between the contracting parties.

The California Legislature is very obliging. It never hesitates to correct the mistakes of earlier legislatures or to change its economic theories when necessity seems to demand it, provided, of course, that there is no powerful pressure-group with a well-organized lobby opposing the change.

The theory was advanced by the retail druggists' lobby and others that the Fair Trade Act needed some "teeth," that it should be made easier to wreak legal vengeance upon some one when a duly signed Fair Trade contract failed to get the desired results, that possibly the highway to retail prosperity could be made smooth by paving it with lawsuits!

In 1933 the Legislature amended the California Fair Trade Act by adding the following section:

'Section 1^{1/2}. Wilfully and knowingly advertising, offering for sale or selling any commodity at less than the price stipulated in any contract entered into pursuant to the provision of section 1 of this act, whether the person so advertising, offering for sale or selling *is or is not a party to such contract* is unfair competition and is actionable at the suit of *any person damaged thereby* " (Stats 1933, page 793, ch 260)

Thus it is seen that the 1933 amendment to the Fair Trade Act authorizes an action to enforce a contract between a manufacturer or a wholesaler and the

retailer against anyone who "wilfully and knowingly" violates it, even though the party had not signed the contract. The person bringing the action need not be a person who has signed the contract, but may be any person damaged by the breach thereof. The amendment appears to declare that a private price fixing contract entered into between a manufacturer or wholesaler and a retailer may take on a status approaching that of a law binding upon every one else who knows about it.

The constitutionality of the 1933 amendment has not been definitely decided. There is no Federal decision or other state Supreme Court decision in point because there is no other statute similar to the California statute to be construed. The cases that have arisen in this state under the Act have not yet been decided by the California Supreme Court. One of these cases is now before the Court but no decision has been rendered. There have been trial court decisions upholding the amendment and decisions declaring it unconstitutional. Notice will be taken of three decisions in the trial courts.

Since there is no direct precedent for the 1933 amendment the courts are not in a position to follow an established precedent, moreover, it is impossible for the attorneys before a court to prove positively what the effect of the amendment would be, for the simple reason that the fact does not yet exist. If the court can decide the case on neither proof nor precedent, then it must theorize. If so, the decision will depend upon the economic theories of the particular judge or judges who hear the case.

In each of the California cases the plaintiff was a manufacturer or distributor who had signed a Fair Trade contract with various retailers. However, in each case the defendant was a retailer who had refused to sign one of plaintiff's contracts and was selling at a price lower than that named in plaintiff's contracts.

In the case of *Max Factor & Co vs Clarence G Kunsman*,¹ decided in October 1933, by Judge Emmet H. Wilson of Los Angeles, it was held that the 1933 amendment violated both the California and the United States constitutions. The court considered the amendment an attempt to legislate under the police power, but held that the amendment had no reasonable and necessary connection with the public welfare. The court says,

'The right of the owner to sell his property at a price satisfactory to himself is an inherent attribute of the property itself,' and is within the due process clause of the Fifth and Fourteenth amendments to the Constitution of the United States.'

The court further states

'A legislative enactment undertaking to regulate useful business enterprises is subject to review by the courts with a view of determining whether it is a lawful exercise of the police power or whether under the guise of police regulations there has been an unwarranted interference with the constitutional right to carry on a lawful business to make contracts or to use and enjoy property.'

In summing up the case against the 1933 amendment the court says

'It necessarily follows that section 1½ of the Fair Trade Act is in violation of the Fifth and Fourteenth amendments to the Constitution of the United States and in violation of the Constitution of California, in that it deprives persons of their property without due process of law and without compensation. It abridges the privileges and immunities of citizens. It deprives them of the full and free use of their property. It imposes an unlawful, unnecessary and unreasonable restraint

¹ See text of opinion, *The Los Angeles News*, October 21, 1933.

upon the alienation of property and upon contracts, and it is an unlawful interference with private business. It is not a valid exercise of the police power and it is not for the protection of the peace, health, safety, morals, or welfare of the public." (*Italics mine*)

This decision is a good expression of the older economic theories relating to property and contract rights. The court takes the view that the public welfare demands hands off from private property and non-interference with business competition, at least so far as the retailing of cosmetics is concerned.

In *Weco Products Company of California vs. Sunset Cut Rate Drug Co.*,¹ decided in January 1934, by another Judge of the Superior (trial) Court, the amendment was held constitutional. The court did not devote very much space in its opinion to the knotty problem of "public welfare," not approaching that indefinite theory nearer than to say, "the legislative body is presumed to be guided by proper considerations of public policy." Most of the opinion is devoted to the argument that the amendment is valid on the theory that it was passed to protect the manufacturer or distributor, that is, to protect his system of contracts, good will, trade-marks, etc. The defendants by their conduct were inducing other people who had signed contracts to break them.

Parties to a contract traditionally have been given some protection against third persons coming in and inducing the other person to break the contract. But never before has it been held that mere price cutting by the third party was the kind of conduct which would make him liable. However, in no other case decided on the theory of protecting contracts against the actions of third parties has there been a statute declaring price cutting unlawful. In this state under the Fair Trade Act if the defendant's actions are unlawful, they are unlawful because of the statute and not because the contracts are injured. Therefore it would seem that the court's reliance upon the legal theory that the plaintiff has a right of action because of an unlawful invasion of his contract is not sound. It cannot be logically advanced that the breaking of the contract because of fear of competition is an unlawful invasion of contract right on the part of the third party competitor, unless it can be held to be constitutional for the Legislature to give private contracts the status of law which cannot be broken.

In the *Weco* case the court in its opinion barely referred to the "public welfare," and made no reference to the welfare of the retailers.

This case would not be precedent for the constitutionality of that part of the Act which states that "anyone injured thereby" can sue.

If the Supreme Court should decide that the manufacturer has property rights remaining to him in trade-marked articles which he can protect against any price cutting then he, but not the retailers, would have a legal remedy.

The last decision to be particularly noticed in this paper is the case of *General Cigar Co. vs. The Drug Market*,² decided in the Superior Court, in September 1934. In holding the amendment constitutional the court said, "It is in evidence before me that the underselling of branded and trade-marked articles has resulted in the bankruptcy of hundreds of small independent dealers, leaving in its wake unemployment and economic distress," and it "is a fair exercise of the police power

¹ See text of opinion, *West Coast Druggist* February 1934, page 8.

² See text of opinion, *The Los Angeles Daily Journal*, September 28, 1934.

" The court took the view that the amendment was enacted to aid the retailer directly, and indirectly to promote the public welfare

The older view of police power was that it extended only to public *health, safety and morals*. The court in the *General Cigar* case takes the newer view that the police power extends also to some field, as yet poorly defined, that is sometimes termed "public welfare," and sometimes called "economic welfare, public convenience and general prosperity of the community." In support of the view that the police power extends to the economic sphere the court quotes at length from the case of *Nebbia vs New York* (March 1934), 291 U S 502, 54 Sup Ct Rep 505

If the law making body within its sphere of government concludes that conditions or practices in an industry make unrestricted competition an inadequate safeguard of the consumer's interests produce waste harmful to the public, threaten ultimately to cut off the supply of a commodity needed by the public or portend the destruction of the industry itself, appropriate statutes passed in an honest effort to correct the threatened consequences may not be set aside because the regulation adopted fixes prices reasonably deemed by the legislature to be fair to those engaged in the industry and to the consuming public "

The *Nebbia* case clearly shows that the police power now extends to economic affairs, but it must be noted that the prices in the *Nebbia* case were fixed by the government itself

As an additional ground for upholding the 1933 amendment the court in the *General Cigar* case advances the following theory " where the goods are well advertised and branded, a manufacturer has an interest, or concern, if you like, in those goods which are identified by his marks and advertisements " The court places great weight on the New Jersey case of *Robert H Ingersoll & Bro vs Halme & Co*, 89 N J Eq 332, 108 Atl 128. New Jersey passed a statute making it unlawful to "discriminate against (a trade-mark) by depreciating its value," etc, except where the goods did not carry a notice forbidding such practice. The plaintiff marketed a popular brand of watch bearing a notice and trade-mark, the notice being construed by the court as a contract. The notice or contract provided that the retailer was licensed to use the *trade-mark*, etc, provided the watch were not sold for a price other than \$1.35. The retailer could remove the notice and *trade mark* and sell the watch at any price that he chose, but without removing the trade mark and notice this particular defendant offered the watches for \$1.00. The court held it unlawful for the defendant to do so, and held the New Jersey statute constitutional. But it is to be noted that the New Jersey contract did not set a price on the *article itself* as do the contracts authorized by the California statute. Possibly some courts would be inclined to distinguish between the two statutes.

It will be very interesting to read the opinion of the California Supreme Court, and ultimately an opinion from the United States Supreme Court.

The court says, in the *General Cigar* case, "It is a matter upon which only the opinions of the highest court in the state and nation can be of practical interest to the litigants, their counsel and the commercial world in general." In the meantime, we must be guided—and confused—by the decisions of the trial courts, and since these decisions are in direct conflict one with another, we can only guess what the law will ultimately prove to be.

Will a judicial opinion upholding the validity of the 1933 amendment to the Fair Trade Act solve the problem? At their best such contracts are very difficult

and expensive to enforce¹ One user of Fair Trade contracts plaintively writes "We cannot sue 200 or 300 retailers Frankly, the legal expense is beyond our means"²

Possibly, after all this legal travail, many retailers will place slight reliance on Fair Trade Acts, amendments, injunctions, voluminous briefs and learned but conflicting judicial decisions We find editorial reference to the "universal complaint of Fair Trade manufacturers that retailers are not showing enough interest in the Act to return contracts, and the lack of support of Fair Trade items by retailers, the apparent divided opinion on the part of manufacturers regarding the advisability of refusing to sell retailers who do not sign Fair Trade contracts"³

There is no provision in the Fair Trade Act that the minimum retail price named in the contract shall be high enough to insure a profit to the retailer

There is no requirement that products be sold to all retailers at the same price

There are many types of disastrous competition that cannot be reached by Fair Trade legislation It does not limit the *producing* units—factories, laboratories, etc, with duplicating machinery It does not limit the number of *distributing* units with their duplication of facilities Nor does it limit competition between substantially the same product under an unlimited number of trade names It does not limit the number of competing retail stores, as new stores are permitted to open at any time regardless of the public need for such stores

More sweeping legislation is needed to correct the difficulties confronting the retail druggist

THE PLACE OF COMMERCIAL SUBJECTS IN THE PHARMACY CURRICULUM *

BY NEAL B BOWMAN¹

No one will deny the fact that there is an ever-increasing trend toward specialization in almost every field of endeavor Therefore, it is not surprising to find that the drug business is concerned with various proposals concerning its possible reconstruction This reconstruction was given impetus by the increase in course requirements and the demands brought about by changes in the business relations of the pharmacist, and the question suggests itself, "What is the place of commercial subjects in the pharmacy curriculum?"

Each teacher of commercial subjects, quite naturally with intellectual honesty, will champion his own subjects, feeling justified in so doing by virtue of the fact that he is the one charged with the responsibility of teaching those subjects

Society is so constituted that every member of it, after he has passed his

³ *West Coast Druggist* July 1934 page 12

* Section on Commercial Interests, A PH A, Portland meeting 1935

¹ Assistant Professor of Economics and Commercial Pharmacy in the School of Pharmacy of Temple University, Philadelphia Pa

formative period, takes up a certain phase of its activity, which constitutes his vocation. Hence, one of the important needs of the individual is preparation to perform his vocational tasks efficiently, because they represent the largest part of his work in life. This preparation might come partly by placing the individual in his industrial environment at the same time that he is pursuing his studies. But of the higher vocations, like pharmacy, which demand the exercise of the highest powers of the mind, experience cannot be left wholly to the apprenticeship system, but rather should it require an extended period of special theoretical education.

Teachers of commercial subjects are faced with the very important problem of integrating and correlating the various commercial interests into a composite whole with such a synthesis of content as will develop the very best offering. The work offered should be designed to "bring education down to earth and make it vital in its application to living." Or, to put it differently, the subject matter should be so patterned as to vitalize practical education.

The difficulties of the problem have been augmented by a very definite realization of the fact that business itself moves so swiftly, and assumes such a multiplicity of forms, that the mere exigencies of curriculum planning make it very difficult to keep pace with business. These are rushing, tumultuous times. The tide of world affairs runs high, trifles and petty worries and hurries hem them in on every side. Never has there been a greater need for an understanding of business institutions, their functions and their influence on the social structure. Never before has there been such a need for building in the minds of those who will control business a consciousness of proper ethical business conduct as right now.

Add to this the further fact that students for whom the subjects are intended have changed. If the capacities and potentialities of the students have been carefully analyzed the teachers are faced with the realization that the average student has limitless ambitions—he is hungry and insatiable for life with its rich experiences and sensations. He has freshly awakened interests, all of which represent an influence that may no longer be denied.

The satisfactory departmentalization of subject content is also perplexing, for the most part. Those who are charged with the evaluation of subjects taught should be schooled in the relative usefulness and uselessness of certain subjects in terms of student needs. A critical analysis of college catalogs will disclose the fact that the commercial subjects now offered bear a very definite relationship to contemporary business requirements of the pharmacist. Were free choices manifested, some students would, in all probability, elect certain subjects in preference to others, or they would evaluate subjects in terms of personal likes and dislikes.

Carrying this idea a step further, there might be some students who, with measured dignity, assume that the subject of Advertising should find no place in the curriculum since they have been nurtured in the belief that it is unethical to promote one's activities. But the majority of the students are cognizant of the statement, "To the man who never heard of you, you don't exist." Professionally, a graduate might be the town's best pharmacist—commercially, he might own the town's less frequented place of business. Granting that some do know the pharmacist and his qualifications, the value of constantly keeping his name before the public is vouched for in the biblical exhortation, "A new King grew up who knew not Joseph." The subject of Advertising teaches one how to seek public favor, and how to hold it as

well as to win it The old bromide—"the public will make a beaten path to your door" is still a workable theory

Some students, steeped in tradition, might join forces with those who, because they are not gifted with an analytical mind, would voice their disapproval of any sort of Accounting on the grounds that it would never be necessary to know any of the principles and practices because they don't intend to spend their time "keeping books" Accounting forces one to face facts It has disciplinary value—it trains in construction and exercise It teaches self-reliance, necessitates truthfulness, encourages neatness, stimulates resourcefulness and develops self-control

Many students share the opinion that Salesmanship cannot be taught Salesmanship can be taught and from a broader point of view than merely that of preparing for the selling of goods The thought can be emphasized that all persons are salesmen and that characteristics which constitute successful salesmanship are as applicable to the profession of pharmacy Special attention can be given to the importance and development of character Salesmanship has been defined as "Selling goods that won't come back to people who will come back" and the definition has just as much significance to selling of prescriptions and professional services

The same influence which might cause a student to be intellectually uncongenial to the other subjects mentioned might condemn Merchandising on the basis of the subject being too broad and general to justify the time spent studying it Years ago intensive merchandising was as unnecessary as it was unknown, but to-day, merchandising, or aggressive "store-keeping," as it is sometimes called, must be in tune with modern trade practices To-day pharmacy is more than a profession, it includes a business of modern merchandising

The drug store is now beginning to be a crystallization point of innumerable human wishes, wants, desires and needs The modern pharmacy is a typically American institution which has evolved to meet these demands With its varied activities, covering a multitude of services in addition to its primary health aspect, the American pharmacy has come to fill an integral function in our community life, which though it may overlap with that of other institutions in part, is nevertheless largely unique Pharmacy to-day is competing with many trade outlets The social evolution of the pharmacy offers an interesting commentary on modern civilization, and it could well be termed one of the most important nerve centers for up-to-date merchandising To-day the pharmacist is forced to merchandise the front of his store as well as to professionalize the rear of it He is forced to handle many items heretofore, perhaps, not in keeping with the policy of conducting a pharmacy and the pharmacy has become, in a few strides, "the greatest service station in the world"—an integral part of the distributive system of the community No matter how it may alter in superficial form, the pharmacy, in all probability, will remain the best agency to minister to the many miscellaneous wants of both the sick and the well, young and old, rich and poor, all creeds, all colors, every day and all day The pharmacist is really the purchasing agent for the community he serves His interests are varied and his problems are multiple

It seems idle to condemn the multifarious activities of the pharmacist of to-day, or to suggest a return to the old days when the pharmacist adhered to the strictly limited field of compounding and dispensing of prescriptions and proprietary remedies Though such a move would enable a greater "professionalism" of the phar-

maceutical industry, in the limited sense of the term, it would also involve a decided social and economic loss on the part of the community

Current changes in economic conditions indicate that current changes in business education are imminent. The subject matter and teaching techniques of the various courses in the commercial field should not be bookish, abstract and artificial. It is imperative that the work and methods of the class room parallel as far as possible the actual conditions of the business world of which the students are integral parts. Careful planning on the part of the teachers and whole-hearted co-operation on the part of business leaders will bring about the necessary revision. Business education must remain flexible, and subject to modification in the light of existing conditions in the community. It might be mentioned, at this point, that the writer is now engaged in a project which is designed to study practices in Commercial Pharmacy curricula in order to learn to what extent the Commercial Pharmacy curricula and courses are in conformity with the actual requirements of practicing pharmacists, as evidenced by personal interviews with employing pharmacists in selected and representative districts of Philadelphia and its environs.

The business teacher who has kept in touch with tendencies in the field is fully aware of a real need for general business education in the schools of pharmacy. He must not cling tenaciously to old ideas nor must he go to the other extreme and impulsively adopt each suggested innovation. The efficiency in knowledge of the subject matter must not only be tested but rather the ability to use and apply the underlying principles of the subjects of business as tools of learning and for shaping judgment in matters of everyday experience. Naturally an impelling and abiding interest in the commercial subjects must be created. Should not the commercial teachers hold the demands of business in as high esteem as the demands of the professions?

One cannot read the daily press or converse without meeting a situation which requires a background of business behavior. Because the whole social life is so interwoven with business activities, one needs an understanding of these activities and their effect on the social and political life in order to understand and interpret the happenings of contemporary living.

It is the opinion of the writer that the commercial subjects have a very definite place in the pharmacy curriculum and should not be mitigated in the least. He maintains the point of view that the main objective of commercial training is to augment, *not supplant*, the professional training of the student and thus better fit him for profitable employment after graduation. For surely, "They profit most who serve best."

"THE ASSAY OF ORGANIC MEDICINAL PREPARATIONS CONTAINING ARSENIC"

Presenting a brief review of the available methods for the estimation of arsenic in organic compounds. The details of the various methods are classified for the purpose of making a comparative study of the analytical procedures. The tendency toward improved technique is noted while the difficulties encountered in applying a number of details are also indicated. Suggestions are offered, on the basis of experimental data with the idea of developing greater uniformity in a practical and dependable method for the assay of organic arsenicals, particularly those containing pentavalent arsenic.

* Abstract of a paper before Scientific Section A PH A Portland meeting 1935—by Edward J. Hughes

THE DEPARTMENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

C B JORDAN—CHAIRMAN OF EXECUTIVE COMMITTEE, A A C P, EDITOR OF THIS
DEPARTMENT

The paper by Professor Dunn adds valuable data to promote progress in teaching Botany and Pharmacognosy. Such information should be presented to Pharmacy students for their guidance, and guidance of students is important, especially with beginning students—C J ZUFALL

A STATISTICAL STUDY OF THE RECORDS OF THE SAME CLASS IN BOTANY AND PHARMACOGNOSY

BY MARIN S. DUNN *

We have always believed that a close relationship exists between the quality of student work in botany and that in pharmacognosy. However, we have lacked definite quantitative studies to support our view, and it was for the purpose of obtaining these that the following analysis was made, using the records of one class of one hundred and twelve students taking botany and pharmacognosy in successive years (1930-1931) (1931-1932). The final grade in botany represents the average of three or four examinations and two note-book inspections while that in pharmacognosy the averages of quiz grades, note-book and five examination grades.

From the crude scores of the same class in botany and pharmacognosy arranged in simple series, the cases have been regrouped for each examination, quiz and note-book into group series with an interval of five. Then from these, the central tendency as represented by the median, mean and mode, the first and third quartile points, the range of the first quarter, middle fifty per cent and fourth quarter, the quartile deviation and the standard deviation have been computed. Lastly, the correlation from simple series between the final grades in botany and those in pharmacognosy has been worked out using the Pearson formula

$$r = \frac{\sum xy}{\sqrt{\sum x \sum y}}$$
$$P.E. = \frac{6745 \times (1 - r^2)}{\sqrt{N}}$$

The results are given in Tables I and II (Turn to page 993)

DISCUSSION

Casual observation of Examinations I and II in botany would lead one to believe that the class contained many good and many poor pupils with a few average ones. As a matter of fact, as proved by their later records, the reverse is the case, there were a few extremely good pupils, a few extremely poor, and the rest average. Many students who were just above the passing grade of 70 in their examinations in theoretical botany and pharmacognosy were able to pull their final average to the

* Professor of Biology at the Philadelphia College of Pharmacy and Science

eighty mark The means in botany hugged the eighty mark except in Examination IV which was taken principally by those whose grades were low enough to make this examination compulsory Often, students who barely passed botany found themselves continually in hot water in pharmacognosy However, other students who were doubtful in botany but passing, and beginning their study of pharmacognosy found new interest and pulled themselves out of the danger zone

The majority of the class, however, did about the same grade of work in pharmacognosy that they did in botany—some a little better and some a little worse

In pharmacognosy, the first examination was poorly answered by many of the students, Examination II was a little better, Examinations III, IV and V showed continuous improvement with the peak reached in Examination V where 25 students made between 96 and 100, 30 between 91 and 95, 25 between 86 and 90 (Table I) From a wide distribution of marks, the field became more and more limited, except in the range of the first quarter where the low grades of a few absolute failures lent themselves to a wide distribution (Table II) The mean of the final grades in pharmacognosy was 79.8, the measure of the spread or variability 9.8

In the normal probability curve, 34% of the cases lie between the mean and $+1\sigma$, between $+1\sigma$ and $+2\sigma$ lie 14% of the cases, between $+2\sigma$ and $+3\sigma$, 2% of the cases In other words if σ is the standard deviation and is measured from the mean, between -1σ and $+1\sigma$ lie about 68% of the cases, between -2σ and $+2\sigma$ lie about 95% of the cases, whereas only about 27 of 1% of the cases lie outside of $\pm 3\sigma$

In our distribution curve in botany if we lay off on the base line distances of $\pm 1\sigma$, 2σ and 3σ from the mean, we find that 71% of the cases lie between -1σ and $+1\sigma$, and 98% between -2σ and $+2\sigma$ Only one case lies beyond -3σ Doing the same for pharmacognosy, we find 79% of the cases lie between -1σ and $+1\sigma$ and about 97% between -2σ and $+2\sigma$ Two cases lie beyond -3σ From the above, we are able to see that although our curves for botany and pharmacognosy do not coincide with the normal curve, yet they approach it rather closely

By the use of the Pearson formula, the correlation index of relationship from simple series between the final grades in botany and pharmacognosy calculated was found to be $+0.58 \pm 0.04$ This is about the same as the correlation of an average of elementary school marks with an average of first-year high school marks It denotes a substantial or marked relationship between the two sets of grades

There is a fair chance that a student doing average or better-than average work in botany will, under the same conditions probably do about the same kind of work in pharmacognosy, while a poor student in botany has the chances against him Of course, other factors play a very big rôle in student success Other things being equal, our data indicates the better the training in botany, the better the chances in pharmacognosy

Since there is apparently a definite positive correlation between work in botany and pharmacognosy, every effort must be made to give the student as fine a botanical foundation as possible Our study also shows there is a need for particularly careful teaching in the early months of study in both subjects—teaching which involves closer coöperation between student and instructor, especially in borderline cases

TABLE I—COMPARISON OF DISTRIBUTION FREQUENCIES OF THE SCORES MADE IN BOTANY AND PHARMACOGNOSY

	Botany							Pharmacognosy

Symonds, Percival M., "Measurement in Secondary Education," The Macmillan Company, New York, 1930

AN ESPERANTO PHARMACOPŒIA?

The *Pharmaceutical Journal* of October 26th, states 'that a difficulty which would arise immediately in producing an international pharmacopœia—such as was suggested at the Brussels Conference—is the choice of language' Latin is obviously unsuitable for description and modern pharmacology. Colin A. Barnes suggests that the international auxiliary language, Esperanto, be used, as this was adopted by the League of Nations some twelve years or more ago as the only practical language in existence for international use. Many scientific papers have already been published through this helpful medium, and there also exists a dictionary of international medical terms published in the language by one of the European countries."

THE SECTIONS OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

The abstracts of the minutes of the sessions held in Portland, Ore August 5 to 10, 1935 (see also brief summary in report, Final Session House of Delegates printed in the JOURNAL for August, September and October 1935) Titles of papers will be given in the Minutes, discussions if any, will be printed when paper is published if not included in the minutes The Editor will be thankful for correction of errors

Abstracts of a large number of papers were distributed at the meetings, some have been printed Abstracts of some papers are still obtainable by addressing the JOURNAL OF THE A P H A 2215 Constitution Ave Washington, D C

SCIENTIFIC SECTION

The First Session of the Scientific Section was called to order by Chairman E V Lynn August 7th, at 2 00 P M in Multnomah Hotel

The Chairman stated that the first order of business would be the Address of the Chairman during which First Vice Chairman, H M Burlage, presided The address follows

THE CHAIRMAN'S ADDRESS

BY E V LYNN

One of the pleasant duties which is every year expected of your chairman is that of extending greetings of the officers to the members and visitors It is with the most sincere feeling that these usual expressions are made to you to day The attendance may be low because of our distance from the geographical center, but our meeting can be of great interest and aid to all of us and it is urged that each contribute freely toward making this an especially successful session As is usual, any credit for the task of making arrangements has been due to our secretary and it is a great pleasure to make here public acknowledgment to the present, efficient incumbent of that office

During the past few years our progress and the volume of scientific literature which has been offered to us have grown to unusual proportions As has frequently been pointed out in previous sessions, there was a time when we needed to beg for contributors in order to make creditable use of our time The objective of each set of officers year after year was to build up an organization by this means which would do much for pharmacy in the way of comprehensive and meritorious research and of discoveries of important new facts concerning the scientific aspects of our profession The results of these efforts have been so successful that we are now confronted with the unique problem how to take care of the numerous papers which are offered

The original object of our meetings was to foster investigation to keep American pharmacy abreast of that in other countries and even as leader and to maintain it on a qualitative plane at least equivalent to that of other professions To day there is certainly no need for altering that view in any respect, we should make it a single creed and rest well content if we can contribute in any great degree toward that goal

Nevertheless the situation in which we find ourselves warrants the most careful consideration There is now offered such a large volume of written reports that we have difficulty in caring for it If we continue to increase thus the results of our energy in research, there may come a time, if it is not already upon us, when the space available for printing will be entirely inadequate Under existing circumstances the ASSOCIATION cannot increase the size of the JOURNAL to make the necessary space What can be done to solve the problem?

One solution would be to accept finally only papers of merit That some of the matter which is offered could be classed as inferior and dispensable is well known Some of it is by no stretch of the imagination in the field of pharmacy some of it deals with easily accessible facts being merely summary or recapitulation some of it is of trifling nature hardly worth the importance assigned to it, some of it embodies only expression of opinions from the authors, without experimental facts As a zealous investigator your chairman may readily have been guilty with others, because intimacy with a particular problem can easily distort one's perspective The

fixing of blame, however is not of moment. The important point is the need for some reliable method of sifting in order to eliminate undesirable matter from publication by this section.

Let it be emphasized as forcefully as possible that your chairman, and without doubt our entire membership, would set no limit on worthy papers. If we should receive reports of this desirable sort, even up to many times our capacity to print, let us accept them gladly and find means to express our appreciation to the authors. The problem of finding space for publication could then be attacked.

It is first necessary, however, to sift out that portion of the manuscripts which could well be eliminated. To my mind the vital question is of quality and not of quantity. Our space in the JOURNAL should be occupied by scientific literature of a character as high as we can possibly make it, for by this literature is American pharmacy judged.

Our action, in 1933, of reviving the Board of Review of Papers and of insisting that all articles be submitted to it was an excellent step, but there is still opportunity for great improvement in this direction. Each paper which has been read during our sessions is at present automatically turned over to the Board. During the two years of this system, members of the Board have conscientiously taken their duties in the proper, serious way and have submitted each manuscript to minute inspection. The adverse criticisms and specific recommendations were then transmitted to the editor for action. Although the latter has power to refuse acceptance of any paper or part thereof, this places an excessive burden upon an already overworked individual. Whether he has or has not succeeded in having the manuscripts properly revised in accordance with findings of the Board is entirely immaterial. There should be some more reliable and easier method for getting the result accomplished.

Your chairman wishes to make recommendations on this subject, which to him seems to be our only important problem. That we should continue to foster a spirit of research, and endeavor to advance our profession as rapidly as possible in this direction is always mandatory, but no specific action is needed, each of us can aid by individual effort. On the other hand, we can as a body do much toward raising the quality of what goes into the JOURNAL. To that end it is recommended that

- 1 The Board of Review shall be given power to reject or accept papers, or parts of papers, for publication and to require revision by the authors when necessary.

If this were adopted, the editor would ultimately receive the manuscript in shape for printing except for editorial corrections and arrangement.

- 2 The Board shall be increased to ten members each serving for five years. They shall be selected and a chairman named by the incoming officers, acting collectively. Any vacancies by resignation or death shall be filled by the contemporary officers.

- 3 The Board shall draw up a list of rules and regulations for the guidance of its members and of authors. This list shall be presented for approval by this section at the next annual convention.

There is another matter which your chairman deems important enough to warrant careful consideration. You will have noted that a large share of the papers this year are to be presented by title only. This seems contrary to the spirit of our objectives since our primary purpose is to meet here in order to hear and discuss the results of recent research. It is recommended therefore, that

- 4 All papers must be presented as given on the program either in abstract or in total. In the case of unavoidable absence, presentation could be delegated to some one else conversant with the subject.

There is still one more matter which should be called to your attention, although no particular action is required. It seems logical to assume that the volume of worthy matter to be published will continue to increase in the future. Some day there will be need for an expanded journal or some new organ as a medium. At present the dues are insufficient to permit a larger journal or more frequent issue. Undoubtedly soon it will be necessary to find a source for greater income whether by larger dues by abolishment of including subscription to the JOURNAL in these dues, by payment from authors for permission to publish papers or by some other means. While the section has no power to decide in what way this can be accomplished, yet each member as a voter in the ASSOCIATION, will have a vote in the final decision. It is good policy to accord this subject careful consideration so that we will be in a position to give meritorious counsel when the time comes.

In concluding, let me express my appreciation of the high honor conferred upon me a year ago in electing me as chairman of this Section. It has been doubly an honor to me because precedent was set aside in choosing an absent member. Your chairman hopes that you have not and will not regret that decision and that the present session will prove of satisfaction and profit to all of you.

After the reading of the Chairman's Address, Vice Chairman H. M. Burlage appointed the following Committee on President's Address: *Chairman*, Glenn L. Jenkins, Baltimore, Md.; F. E. Bibbins, Lloyd E. Harris, C. O. Lee. (See report of Committee in minutes of the House of Delegates, October JOURNAL, pages 920 and 921.)

Chairman E. V. Lynn then resumed the chair, he called for the report of Secretary F. E. Bibbins. The report follows:

THE SECRETARY'S REPORT

F. E. BIBBINS

Your secretary wishes to offer the following report:

Your secretary appreciates the privilege of having been elected to this office and acknowledges the cooperation which he has received from the other officers.

A call for papers for the 1935 meeting was published in the JOURNAL in May, and this was followed by sending two hundred and eighty letters to a mailing list of the members of the Scientific Section. To this list is added from year to year those who have contributed papers for the first time. The response to this appeal was very successful as you will note that eighty-four titles appear on the official program.

There has been considerable correspondence from the secretary's office this year, partly due to the fact that every contributor was advised of a change in our By-Laws requiring that papers should be submitted in duplicate so that one copy would be available for publication and the other copy for the Ebert prize.

On motion duly seconded Chairman E. V. Lynn called for the report of Board of Review of Papers. It was presented by Chairman F. E. Bibbins. It follows:

REPORT OF BOARD OF REVIEW OF PAPERS, SCIENTIFIC SECTION, A. PH. A.

The Chairman wishes to make the following report:

First, I wish to acknowledge the splendid cooperation on the part of the other members of the Committee in reviewing the numerous papers which were assigned to them by the Chairman and the promptness with which the papers were returned to the Editor.

This committee reviewed seventy-four papers, a considerable number of which were returned to the authors for corrections and some for rewriting. It was also necessary that a few of the papers be cut down. In every case the authors complied cheerfully with our requests.

I wish also at this time to acknowledge the excellent spirit shown by Editor Eberle as he has cooperated carefully with us in this work, even though at times it probably held up his work on the JOURNAL.

(Signed) FRANCIS E. BIBBINS,
Chairman

The report was received.

Chairman Lynn called for a report of the Committee to Cooperate with the National Conference on Pharmaceutical Research.

Chairman J. C. Krantz, Jr. stated that the Committee had no report.

The report of the Committee on Monographs was read by Secretary F. E. Bibbins.

The report was received and it was ordered that it take the usual course.

Chairman E. V. Lynn appointed the following as members of the Committee on Nominations: *Chairman* L. W. Rising, Seattle, Wash.; F. J. Bacon, Cleveland; O. L. W. Rowe, Detroit, Mich.

Chairman Lynn stated that if anyone desired to bring anything before the Section the opportunity was now offered.

There being no general business the reading of papers was called for

The first paper on the program was entitled, "A Note on the Action of Alkalies and Alkali Salts on Antipyrine" by Lloyd E Harris and E D Tebow The paper was presented by Mr Harris (No discussion)

The second paper entitled, 'The Test for Redistilled Water in the N F VI Monograph,' by R S Adamson, R K Snyder and E N Gathercoal was presented by the latter

Glenn L Jenkins inquired why a more dilute reagent was not used and a greater volume of it He was informed that it did not make any difference whether $1/10$ normal or $1/20$ normal was used

The following papers were read

"A Note on the Assay of Mass of Ferrous Carbonate," J C Krantz, Jr, and C Jelleff Carr (No discussion)

'A Simplified Assay for the Official Iodine-Iodide Solutions' by Wm F Reindollar (Published in September JOURNAL pages 756-758)

'The Bactericidal and Bacteriostatic Value of Colloidal Cadmium Proteinate' W A Lott and W G Christiansen (No discussion)

"Antiseptics—a Comparative Study of Laboratory and Practical Tests," George F Reddish (Introductory remarks by speaker)

'A Modified Nessler's Reagent Test for Aldehydes in Ether' E C Billheimer, F Van Deripe, F F Berg and F W Nitardy (No discussion)

The following papers were read

The Sulphur Ointments and Their Assay' Charles E Brady and Henry M Burlage (No discussion)

'Bismuth-Sodium Potassium Tartrate Solutions,' A H Clark In his absence this paper was read by E N Gathercoal and also the paper entitled

A Further Note on the Stability of Sodium Sulphite," A H Clark and Solomon Gershon Joseph Rosin stated that to obtain bismuth hydroxide reasonably free of nitrate, a cold solution of hydroxide must be used for precipitation

A paper entitled A Rapid Method for Standardizing Silver Nitrate Volumetric Solution," Robert D'Orazio, was read by title (No discussion)

Chairman Lynn announced that the next two papers entitled, 'Camphor in Camphor Liniment IV' and 'The Use of Antioxidants' by Charles F Poe would be read by title (No discussion)

A paper on 'Dauric Acid' was presented by Ralph W Clark (The paper is published in the October JOURNAL, pages 843 to 847)

The next paper on the program was 'A Study of the U S P Thyroid Assay' This is printed in the September JOURNAL, pages 742-747 The paper was discussed by F O Taylor E N Gathercoal and the author

Among the questions were several relative to the accuracy in assaying tablets with low thyroid content The author replied that if the content is low the quantity can be increased to a certain extent without disturbing the procedure

The next paper of the program was entitled, 'The Assay of Phenol Containing Preparations' by Glenn L Jenkins and Melvin H Duncan presented by Glenn L Jenkins (F O Taylor confirmed the work of the authors)

The following papers were read by title

Observations on Opium Assay" by Joseph Rosin and C J Williams (No discussion)

"Assay Hydrolysis Method for Opium Assay" G E Mallory and Peter Valacr, Jr (No discussion)

A paper on the Assay of Official Syrups containing Hypophosphites" Glenn L Jenkins and Charles F Bruening was presented by Glenn L Jenkins (No discussion)

The Assay of Official Hypophosphite Salts" Glenn L Jenkins and Charles F Bruening (No discussion)

The following papers were read by title

'The Assay of Organic Medicinal Preparations Containing Arsenic' Edward H Hughes (No discussion)

"Some Mercuriated Derivatives of Thymol and Carvacrol " Joseph B Burg (No discussion)

' Mercury Derivatives of Azo Dyes," Wm Braker and W G Christiansen (No discussion)

"Phenyl Mercury Nitrate and Some Other Phenyl Mercury Salts " T B Grave, S E Harris and W G Christiansen (No discussion)

The First Session of the Scientific Section was then adjourned

SECOND SESSION

The Second Session of the Scientific Section was convened by Chairman E V Lynn August 8th, 9 00 A M The reading of papers was continued The following were read

A Study of the Anesthetic Properties of Trichlorethylene," John C Krantz, Jr, C Jelleff Carr and Ruth Musser (It is printed in the September JOURNAL, pages 754 to 756)

Absorption of Drugs by the Human Skin," A Richard Bliss (Read by title presented by Frederick Grill)

J C Krantz Jr, inquired if phenol is more readily absorbed from a petrolatum base than from olive oil Mr Grill said there was no definite statement but that there was an inference that such might be the case

The following paper was presented

The Effectiveness of Theelol by Oral Administration," L W Rowe and A E Simond
Chairman Cook stated that there had been a great deal of variation in these products and an effort was being made to establish relationship He referred to the work of Dr H H Dale and a letter issued by him had been sent to interested laboratories and the suggestion made by the Biological Committee that they endeavor to develop cooperative studies in an effort to determine how uniformity can be brought about by cooperative studies

The following paper was read by title, Notes on the Colorimetric Assay of Digitalis" by Knudsen and Dresbach Method ' F A Upsher Smith (No discussion)

The following paper was presented

Comparison of Six Methods in Assaying the New Ergot Principle," Edward E Swanson, Chester C Hargreaves and K K Chen (The paper is printed in the October issue of the JOURNAL, pages 835 to 839)

L W Rowe desired to know the difference between this isolated rabbit uterus method and the guinea pig method whether the use of the rabbit's uterus is a method of direct testing just as that of the guinea pig's uterus or is it a reversal method F E Bibbins said it was not a reversal method but the alkaloid causes a contraction of the rabbit's uterus In work published in three laboratories has been referred to under Ergotocin Ergostetrin and Ergometrin It is probably present to the extent of $\frac{1}{10}$ th to $\frac{1}{12}$ th of the total ergot alkaloids, and although preparations containing it do not contract the rabbit's uterus, the isolated principal produces this effect

John C Krantz inquired whether ergotrate was the same alkaloid Mr Bibbins replied in the affirmative L W Rowe inquired whether he believed that this alkaloid is identical with the principle reported by Dale and Dudley Mr Bibbins replied that from samples obtained and data he was inclined to believe these three are all the same

The next paper was on Fluid Extract of Ergot Effect of Acidity on Biologic Activity and Determined by U S P 1935 Revised Assay," F F Berg (Discussion will be included when the paper is published)

The following paper was presented by title

' A Toxicological Study of the Cutaneous Secretions of the Salamander, *Triturus torosus* (Rafike) " Ernst T Stuhr (No discussion)

The next paper Dialkylamino Acetyl Ureas " T C Daniels The author was asked on what animals the tests were made he replied On White Rats '

The next paper ' A Study of the Assay of Aconite and the Stability of Its Preparations," George L Baker and Dean Charles B Jordan

L W Rowe inquired whether the method presented checked well with the U S P Method

C B Jordan replied that they did and the results were recorded in the paper The authors assumed that the variations experienced were due to errors in biological assay Other constituents

ents besides aconitine are active, but there does not seem to be much information obtainable on the subject

John C. Krantz, Jr. was of the opinion that more consideration should be given to the therapeutic use of aconite

The next paper by Arthur H. Uhl on "The Fatty Oil of *Podophyllum peltatum*," was read (No discussion)

The next paper "Evaluation of a Deterioration Factor in Liquid Petrolatum," P. L. Burrin, A. G. Worton and F. E. Bibbins

F. F. Berg stated that the experience in their laboratory confirmed the work of the authors

The next paper was entitled, "A New Silver and Mercury Colloidal Compound," Earl Voelker (Discussion)

A paper by Henry J. Goeckel, "Modern Pharmaceutical Research Problems," was presented (No discussion)

Some Thymol Derivatives of Possible Medicinal Value," F. A. Gilfillan and John R. Merritt (No discussion)

The next paper was on "Solution Cresol Compound, the Variation of Phenol Coefficient when Different Oils Are Used for Saponaceous Base," P. L. Burrin, A. G. Worton and F. E. Bibbins (No discussion)

The next paper was entitled "Ephedrine Synthesis I. The Preparation of Propiophenone Diethyl Acetal and of 1-Phenyl-1-Ethoxy Propene 1," Ernest L. Beals and F. A. Gilfillan (No discussion)

Chairman Lynn then announced that there were three papers on strychnine

Strychnine IV. "Lethal Dose Studies on Cattle and Sheep," J. C. Ward and F. E. Garlough

Strychnine V. "Variations in the Same and Different Species of Rodents," by A. W. Moore

Strychnine VI. "Variations in Physiological Action of C. P.," as prepared by J. C. Ward, J. C. Munch and F. E. Garlough—There was no discussion

The following eleven papers were presented by title

"Studies on Barbiturates XI. Further Contributions to Methods of Barbituric Research," Charles R. Linegar, James M. Dille and Theodore Koppanyi. Printed in the October JOURNAL, pages 847 to 852

"A New Crystalline Compound from Catnip," Minnie Meyer and Edward Kremers (No discussion)

"The Preparation of *p*-Butyl Saligenin," Robb V. Rice, W. C. Hardin and Glenn L. Jenkins

"A Chemical Examination of the Fatty Oil of Poke Root," Glenn L. Jenkins and Samuel W. Goldstein

"Evaluation of Vermicides," Glenn L. Jenkins and L. Lavan Manthey

"The Importance of Kidneys in the Standardization of Digitalis," B. Boucek (No discussion)

"A Comparative Study of the Pharmacological Actions of Natural and Synthetic Camphor," B. V. Christensen and H. J. Lynch (No discussion)

"Cyanide Poisoning and Its Treatment," K. K. Chen, Charles L. Rose and G. H. A. Clowes (Printed in the August JOURNAL, pages 625 to 630)

"Pharmacological Action of the Alkaloid of Han fang chi," by K. K. Chen, A. Ling Chen, Robert C. Anderson and T. T. Chow (No discussion)

Chairman Lynn announced a paper on "The Detoxification of Strychnine by Pentobarbital Sodium," Edward E. Swanson

A paper on "Gelatin as a Stabilizing Colloid for Oil in Water Emulsion Systems," Linwood F. Ticc, was presented by E. F. Cook (No discussion)

The Second Session of the Scientific Section was then adjourned

JOINT SESSION SCIENTIFIC SECTION AND SECTION ON PRACTICAL PHARMACY

A Joint Session of the Scientific Section and the Section on Practical Pharmacy and Dispensing was called to order by Chairman E. V. Lynn of the Scientific Section. Chairman H. M. Burlage of the Section on Practical Pharmacy presided as co-chairman.

The first item on the program was a report on the United States Pharmacopœia by Chairman E F Cook. The report is printed in the September JOURNAL, pages 796 to 800.

The report on the National Formulary was presented by Chairman E N Gathercoal. It is printed in the August JOURNAL, pages 689 to 694.

The report of the Committee on Recipe Book by Chairman J Leon Lascoff was presented by title. It is printed in the August number of the JOURNAL, pages 694 to 699.

Chairman Burlage called for the Committee on Unofficial Standards. Former chairman J C Krantz, Jr. stated that the Committee had been discontinued.

Report of the Committee on Glass Standardization was presented by H V Army. (It was received.)

Chairman Lynn resumed the chair and called for the report of the Committee on Ebert Prize. It was presented by Chairman Glenn L Jenkins. The report of the Committee follows.

REPORT OF THE EBERT PRIZE COMMITTEE

Your Committee unanimously recommends that the Ebert Prize for the best paper presented at the 1934 meeting be awarded to Professor Marvin J Andrews, author of the paper "Determination of the Reasonable or Permissible Error in Dispensing."

(Signed) GLENN L JENKINS, Chairman FOREST J GOODRICH B V CHRISTENSEN

Chairman Lynn announced that the next item of the Program was the report of the Committee on Collection of Information Pertaining to Professional Pharmacy, prepared by Chairman M J Andrews and presented by Secretary Leon W Richards. The report was received—to be published.

The report of the Committee on Prescription Tolerances was presented by H H Schaefer. It was received—to be published.

The reading of papers was proceeded with.

The first paper entitled "Daphnia—The Biological Reagent" by Arno Viehoveer.

The second paper "Biochemistry of *Podophyllum Peltatum*" by Arno Viehoveer and Harry Mack, read by E F Cook.

These two papers were presented by lantern slides, showing the effects of these drugs.

After the conclusion of the papers a motion was made by R J Goodrich expressing thanks to the authors.

Chairman Cook stated that there is a reprint available concerning the propagation and means of keeping *Daphnia* alive and also a paper on the subject presented showing the action of drugs.

The Joint Session was then adjourned.

THIRD SESSION

The Third Session of the Scientific Section of the AMERICAN PHARMACEUTICAL ASSOCIATION was convened on August 9th at 9 00 A M by Chairman E V Lynn.

The reading of papers was continued. The first paper was entitled "The Alkaloidal Content of Oregon Grown *Cytisus Scoparius*" by F A Gilfillan and Felipe Patricio Logan. (No discussion.)

E N Gathercoal read the following three papers: Morphological Studies on *Polygala Senega*; Paul D Carpenter, Studies on Poplar Bud; Gerston Bruch and Elmer H Wirth, Studies on Cudbear; Elmer H Wirth, L E Martin and F Soderdahl.

In commenting H W Youngken said the papers represented very careful work. The diagnostic differences of *Populus canadensis balsamifera* and *nigra* had been brought out. The paper on *Senega* represented careful study—the thicker and thinner walled cells of the phloem were explained hence the paper represents a distinct contribution.

The papers "A Study of *Laciniaria* Species" by B V Christensen and G M Hocking and "Differentiating Characteristics of Glycyrrhiza Plants" by Arno Viehoveer, were presented by title. (No discussion.)

The paper "Microscopy of Powdered Desiccated Thyroid and Suprarenal Glands," was presented by the author Heber W Youngken.

E N Gathercoal said that when it was first decided to introduce the powdered desiccated glands into the National Formulary the possibility of identifying them and detecting

adulterants was considered. The group to whom this was referred thought it would be impossible. This work of Dr. Youngken, he was convinced, proves that there is not only a means of identification but a means of determining adulteration. He spoke of the work of Dr. Dunn and of his assistant, the former were pleased with the results of Dr. Youngken's work.

L. W. Rowe inquired whether an effort had been made to differentiate between anterior pituitary and posterior pituitary.

The author replied that this is possible—The posterior originates from the nervous system and not from the epithelial tissue. (See page 576 of the July JOURNAL.)

Commenting on the next paper, 'A Method of Preparation of Buffers for Prescriptions,' by C. F. Allen, T. C. Daniels said that a related paper should be discussed before the Section on Practical Pharmacy and Dispensing, it is of particular interest to eye, ear, nose and throat specialists.

A series of papers on 'Drug Extraction' (5-9) was presented by William J. Husa. (See prior papers in the JOURNAL.) A remark by the author is applicable—'We are not as greatly interested in what occurs in the percolator as in what comes out of the percolator.'

The following papers were presented by title: 'The Influence of Certain Salts on Morphine Toxicity and Narcosis in Mice and Rats,' J. M. Ort and W. G. Christiansen; 'A New Type of Hypnotic Amide,' W. A. Lott and W. G. Christiansen; 'Preparation of Benzoyl Per-sulphide,' E. Moness, W. A. Lott and W. G. Christiansen; 'The Percolation of Cinchona,' J. L. Powers and Edward Kremers.

The next paper, 'Bioassays of Rodenticides,' J. C. Munch, F. E. Garlough and J. C. Ward was presented by J. C. Ward.

John C. Krantz, Jr., inquired whether white rats were used in the test. The author replied—White rats and rabbits. Other questions followed—asked how zinc phosphide was administered, the author replied—with acacia or other colloid. Responding to whether the oral method was always used in the tests, the author replied—yes, because they were concerned with the toxicity of these poisons in the stomach. Asked regarding strychnine—this had been administered in acacia, parenteral methods had been used, but they found variability, they used a large number of animals for making determinations and they are quite well satisfied—within ten per cent. on the basis of using 1500 animals.

A paper on 'Thallium,' XIII, was presented by J. C. Ward. (No discussion.)

The following papers were read by title. (No discussion.)

'Constituents of Ma fang chi,' A. Ling Chen and K. K. Chen; 'The Cat Units of Seven Crystalline Cardiac Principles from Plants,' K. K. Chen, A. Ling Chen and Robert C. Anderson; 'Harmine from Caapi,' A. Ling Chen and K. K. Chen; 'A Study of Several Species of the Genus *Monarda*,' B. V. Christensen and R. S. Justice; 'Histology of *Craeca virginiana* Linne Root,' B. V. Christensen and Elbert Voss; 'Monarda Pectinata,' Nutt., A. Phytochemical Study,' Joseph B. Burt and Edward Kremers; 'Thiobarbiturates. III. Comparison of Sulphur and Oxygen Analogues,' Ellis Miller, James C. Munch and Frank S. Crossley; 'Enzymatic Action in the Presence of Some Common Antiseptics,' O. E. Rumble and R. J. Hartman; 'Some Properties of Ergostetrine,' Marvin R. Thompson. —(See September JOURNAL, pages 748-753.) 'Preparation and Toxicity of Bismuth Salts of Camphoric Acid Esters,' W. M. Lauter and H. A. Braun; 'A Study of Bismuth Salts of Gluconic Acid,' W. M. Lauter and H. A. Braun; 'Evaluation of Line Methods for Determining Morphine in Opium,' V. H. Wallingford and August H. Homeyer; 'Report of Chemical Assay for Ergot Alkaloids,' C. K. Glycart; 'The Volatile Oil from Western Yarrow,' R. L. McMurray; 'The Toxicity of Hydrocyanic Acid Gas,' J. N. Etteldorf.

A paper on 'Chemical Study of Sulphur Ointment,' Lewis C. Britt. (See October JOURNAL, pages 854-856.) Glenn L. Jenkins described a method by simple ignition of the ointment and then analyzed for sulphur by the Parr bomb method.

The report of the Committee on the Chairman's Address was read and received.

The report of the Committee on Nominations—L. W. Rowe, Franklin J. Bacon, L. W. Rising—was read by L. W. Rowe, nominating Chairman, H. M. Burlage, First Vice Chairman, Glenn L. Jenkins, Second Vice Chairman, J. C. Ward, Secretary, F. E. Bibbins, continues for 3 year term, Delegate to the House of Delegates, E. V. Lynn. After formal action the nominees were duly elected.

Glenn L. Jenkins reported the action taken on the award of the Ebert prize to Marvin J. Andrews. The action was approved.

The officers for the ensuing year were duly installed
 The new officers expressed their appreciation of the honor and accepted the duties of office
 The retiring Chairman, E V Lynn, expressed his appreciation of the honor of office
 The Scientific Section was then adjourned in due form

SECTION ON PRACTICAL PHARMACY AND DISPENSING

The First Session of the Section on Practical Pharmacy and Dispensing was called to order by Chairman H M Burlage at 9 15 A M He requested R W Clark *Delegate to the House of Delegates* to take the chair during the reading of the chairman's address The address follows

ADDRESS OF THE CHAIRMAN

BY H M BURLAGE

Since this is the first meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION on the Pacific Coast for many years and since many pharmacists are gathered in Portland for the annual meetings of the State Associations of Idaho, Washington and Oregon, this 83rd annual meeting should be a memorable one for all of us who are able to attend even though our coming has been at a great sacrifice I as *Chairman* of the Section on Practical Pharmacy and Dispensing, welcome all pharmacists here assembled, as well as the members of the A P H A residing on the Pacific Coast and in the Pacific Northwest, to our sessions and we hope that you will be benefited by the papers, discussions and deliberations which may arise We hope that you will convey to us manifold new ideas and thoughts which have been brought to your minds during your practice of our ancient and honorable profession in this region

I note on our program the names of several individuals who reside in this section and I hope that those of us who have purposely traveled far for these meetings will avail ourselves of the opportunity of becoming acquainted with these pharmacists for I know by virtue of the unusual opportunities that are offered them in this beautiful country that you will profit by their acquaintanceship I know whereof I speak, since I have had the advantage of five years' association and residence in this section

I do not intend to consume much of your time, as is so often done in chairmen's addresses to eulogize our profession Its history speaks for itself, its present and its future should concern all of us who are interested in its welfare

U S P, N F AND RECIPE BOOK

Within a short time we will have available new revisions of the Pharmacopœia, the National Formulary and the Recipe Book, which are the standards and the handiworks of our profession It behooves all of us to become thoroughly acquainted with these works, to see that every pharmacy in the country has these available and then to assist in a program of propagandism whereby the workers in the allied profession become thoroughly convinced of their value and of the worth of the products therein recognized Such works, in spite of the efforts of many reputable investigators, cannot be perfect and the research workers among us should immediately begin to study and examine them with an aim toward improvement These new editions, no doubt, will present some radical changes which we all hope are for the best

WORK OF THE OFFICERS

During the past year your chairman with the help of the officers of the Section, has attempted to nullify a criticism that has been made quite often with regard to the programs of this Section, *ie*, that many of the papers are too scientific in character, since they are offered by teachers of pharmacy and other scientific workers in laboratories of manufacturing establishments, etc, and that they, therefore are not of a practical professional nature representing the problems generally met with in the retail, professional and hospital pharmacies How justifiable is such a criticism? Possibly the facts will speak for themselves

A study of the programs of this Section for 1920-1934 inclusive reveals 316 papers representing the efforts of 399 authors or co authors, or 327 different individuals An examination of the titles of these papers in so far as your chairman's judgment could operate indicates that ap

proximately 170 (or 53.8%) of these were of sufficient interest to any practitioner of pharmacy in the retail, professional or hospital vocations. The remainder of the titles would indicate papers that pertained to the scientific aspects of individual subjects dealing with theoretical and scientific pharmacy. I am wondering, who of us could be so narrow in our views and outlook to demand that the latter types of papers be eliminated from our programs? Certainly we have too much of commercialism before us now.

We are, however, dealing with facts so let us proceed further in order to ascertain if the criticism mentioned is justifiable. Of the 327 individuals represented on the programs 166 (or 41.7%) were teachers and students (probably graduate students), 80 (or 20%) commercial and commercial laboratory workers, 44 (16 of which were doubtful) (or 11%) were retail and professional pharmacists, 33 (or 8.3%) unclassifiable, because of lack of information. 23 (3 doubtful) (or 5.7%) hospital pharmacists and 5 (or 1.3%) members of boards of pharmacy. If the unclassified are considered as retail pharmacists this number rises to 19.3%, if board members and hospital pharmacists are included the total rises to 26.3%, or slightly more than one-fourth of the total number of authors were practicing pharmacists. Certainly not an imposing number considering the total of those working in the various classifications of the profession.

This résumé indicates that 73.7% of the authors of papers were teachers and laboratory workers. This large percentage no doubt, can be accounted for because these workers have probably more time available and better laboratory facilities for such work and, above all, a greater interest in the problems confronting the profession. Certainly the figures reveal that too few of the registered pharmacists in the retail, professional and hospital pharmacies are taking an active part in the A. P. H. A. and this section. The following reasons might be offered to account for this condition: (1) the average retail pharmacist is too busy with things commercial and too occupied in combating a competition for which he is mightily responsible, (2) and as a result of the first mentioned condition he is not primarily interested in phases of professional pharmacy which serve as the very core of the profession, particularly the dispensing department. This, to my mind, is one of the discouraging present-day aspects of pharmacy and one which we who are interested in the teaching of pharmacy hope will be overcome in due time by the advent of the four-year minimum course in pharmacy. (3) apparently the proper contacts and methods of approach with the view of interesting these numbers in membership of the A. P. H. A. have not been followed by the individuals in the organization responsible for such a campaign. It is, of course, impossible to ever hope that every retail pharmacist would maintain a membership in the A. P. H. A., but I believe that almost 100% of the professional and hospital pharmacists of this country should hold such membership. Previous chairmen have time and again before this section recommended that the ASSOCIATION make special efforts to interest the latter two groups in the organization.

As a result of the above mentioned study the officers of the section decided to make special efforts to interest more practicing pharmacists in the activities of the section. Accordingly, letters were sent to the deans of the Schools of Pharmacy and secretaries of State Associations requesting the names of pharmacists who might be interested and capable of presenting a paper before this body, and it was emphasized that it was not necessary for the author to be present or for him to be a member of the association. What was the result of such a solicitation? One officer reports that in response to 17 letters—to 8 deans and to 9 state associations—only one reply was received and one name suggested and no paper. Another sent out 48 personal letters and received 8 replies from 5 deans and 3 secretaries and finally 6 replies from those whose names had been suggested. A third wrote to 10 secretaries and 8 deans received replies from 7 deans and no secretaries. These replies however included 31 names of individuals to solicit, three of this number stated that they would offer papers but I note only *one* title from this group on the program. A fourth sent out 35 letters to individuals in the pharmaceutical retail field. I believe the results of this canvass are almost self evident and indicate in a vivid manner why a majority of the authors are not practicing pharmacists, and it also points out how interested some deans and state secretaries are in the sections of the ASSOCIATION and what little faith they have in the capabilities of the persons whom they represent and have trained.

COMMITTEES OF THE SECTION

The chairman of the Committee on Glass Standardization previously requested that this

committee be discontinued, but the Section overruled the recommendation. Since he repeats his request I recommend that this committee be discontinued unless recent developments have arisen which warrant its continuation.

During the year a new committee known as the Committee for the Collection of Information pertaining to Professional Pharmacy was created, and under the guidance of Prof. Marvin J. Andrews has made remarkable progress. His report will be given at the Joint Session and should be of interest to all of us. Its work has just begun and I recommend its continuation and that the Council be requested to appropriate \$75.00 to carry on this work. This appropriation includes \$50.00 to cover expenses of correspondence for 1935-1936, and \$25.00 to purchase filing materials for properly preserving the information collected during 1934-1935, in the INSTITUTE OF PHARMACY. I further recommend that the new chairman hold intact the present personnel of this committee unless the committee chairman requests changes or additions since its work will be handicapped by the appointment of new members who are not familiar with procedure that is being followed.

In conclusion I wish to express my appreciation of the honor that the Section has bestowed upon me in electing me its chairman, and my thanks are offered to the officers of the Section and others who have cooperated in the work that has been done, and especially to Secretary Richards who deserves all the credit for the program which follows. His task has been a difficult one.

I recommend that in Chapter IX, Article II, the words "and a brief abstract of all papers, not to exceed 250 words" be deleted.

A motion was made by William Gray, seconded by E. T. Motley, that the Chairman's Address be received and referred to a special committee. The Acting Chairman appointed H. A. Langenhahn, E. T. Motley and C. F. Lanwermyer.

REPORT OF THE SECRETARY

BY LEON W. RICHARDS

The Section on Practical Pharmacy and Dispensing has endeavored to enlist the interest of as many new contributors as possible by definitely centering the attention of this meeting on the fields of retail, professional and hospital pharmacy.

The Secretary wishes to express to his fellow officers his appreciation for the assistance given him in sending out the necessarily large number of personal letters to accomplish this end.

The response from pharmacy men, especially those of the Northwest, is ample reward for our efforts, and I wish to thank each author on our program for his interest and cooperation.

The report was accepted.

Chairman H. M. Burlage appointed E. L. Hammond, R. A. Cain and E. T. Motley, *Chairman* members of the Committee on Nominations.

The Chairman announced the reading of papers.

The first paper was presented by George D. Beal, "Carbo Activatus," by Joseph Rosin. George D. Beal, Chester R. Szalkowski. (Published in August JOURNAL pages 630-634.) "Fore sight in Professional Pharmacy" was read by title, because of the unavoidable absence of the author, E. T. Stuhr. "Dentistry and Pharmacy as Cognate Professions" was presented by the author Raymond P. LeRoy. Drawing on his paper he said that a slightly hypotonic solution was desirable for the purpose of anesthetic efficiency. The matter of containers for novocain solutions was also discussed. The next paper "Is Extemporaneous A Moribund Art?" by Wm. F. Reindollar, was read by title. "Back to Pharmacy" was presented by Roy A. Perry.

William Cray complimented the author. He questioned the guarantee of a preparation in some instances refunding of the money would not answer the purpose he had in mind. The simple ailment might result in a more serious one. The subject was discussed along related lines by E. R. Serles, P. H. Dirstine and L. D. Bracken.

The author stated that all dispensing required judgment, it is necessary to use care and he always had in mind the best possible preparation rather than a large sales volume. There was a demand for packaged medicines and in his opinion—to supply a better preparation was a service. He always advised consulting the physician and dentist but many times the patrons would say—they were not that sick.

L. D. Bracken said he did not sell "patent medicines" but he realized the economic de-

mand for such products. He invariably advised the patron to consult the physician, but if the patron insists on making a purchase, it is better to supply what the pharmacist has prepared carefully and honestly.

H A Langenhan thought there was opportunity along the lines advocated by the author, provided thought and care was exercised.

There was no discussion of the paper on 'Manufacturing and Marketing Toilet Products from Your Own Laboratory,' by Alex F Peterson Jr.

'New Products and the Problems They Present,' by Ronald V Robertson. The author discussed the subject, he referred to a number of preparations representing the same product and necessitating the stocking of them. Earl Gunther commended the paper and in his opinion something should be done to correct the situation.

The paper on 'The Stabilization of Milk of Magnesia by Citric Acid,' E C Bilhuber F F Berg and F W Ntardy, was temporarily deferred on request of F F Berg.

'A Service That Built a Prescription Business' was presented by L D Bracken.

H A Langenhan endeavored to get the physician's viewpoint on the subject of the paper. The author, whose pharmacy has the largest medical practice in the Northwest, said that physicians sought advice. The pharmacy has an average of eighteen calls from physicians to consult on prescriptions for patients.

William Gray stated that physicians wanted information along the lines discussed in the paper. He had read a paper before the Council on Medical Education, by request. Leading men of the medical profession commented favorably, the sum and substance of their opinions being,

"Consult your pharmacist—you can learn something." He was of the opinion that physicians welcomed assistance from pharmacists.

The author closed the discussion by saying that some physicians are hesitant in seeking information, but the bigger the man the more readily he will receive information.

There was no discussion on the following papers: 'The Need of Greater Care in the Dispensing of Potent Medicinal Substances in the Form of Sugar Coated Pills in Confections,' John F Suchy; 'The Hospital Pharmacists' Work in Southern California,' P W Howard (Read by title); 'A Plan for Pharmacy Internships at the University of Michigan Hospitals,' Harvey A K Whitney and E C Watts; 'Professional Aspects of Pharmacy,' S H Dretzka (Read by title).

On motion duly seconded the First Session of the Section on Practical Pharmacy was adjourned.

SECOND SESSION

The Second Session of the Section on Practical Pharmacy and Dispensing was convened at 9 00 A M, August 9th, by Chairman H M Burlage. Ralph W Clark acted as secretary, owing to the temporary absence of Secretary Leon W Richards.

The reading of papers was continued.

C O Lee read a paper on 'A Study of Compound Cresol Solution' by K L Kaufman and C O Lee. The speaker pointed out the value of this work to the students. A method had been devised for making this solution in fifteen minutes, while another formula required three hours. He stressed the necessity of exactness in making the preparation.

H M Burlage referred to the use of soft soap in a rapid method for the preparation.

The next paper was entitled—'The Physician and the Pharmacist' by Ralph W Clark. The author commented, 'that pharmacists should read the literature of their Associations and pharmaceutical publications and they should take an interest in public health matters. If pharmacists would stress professionalism more, the public would be willing to pay more and would look up not down on the profession of pharmacy.'

C O Lee inquired how this could be brought about. The author replied—that in Wisconsin they were particularly fortunate in having a president who had experience in both professional and commercial pharmacy.

Frederick Grill stated that their students were impressed with the ideals of Pharmacy. William Gray thought that meetings within the school would prove helpful. Earl Gunther thought that colleges should seek out the problems of the practical pharmacist. C O Lee referred to the fact that commercial ideas predominate. William Gray acknowledged the difficulty in stimulat-

ing interest in pharmacy H M Burlage pointed to the influence of those who belittled professional pharmacy and that, perhaps a division of the students into two groups might prove helpful Earl Gunther referred to a statement of the professor, "that students should forget their practical (?) store experience" He learned his lesson when the professor informed him that because he had not forgotten his practical (?) experience, his grades were low Ralph W Clark stated that, in Wisconsin, they were trying the experiment of having professional pharmacists talk to the students

"Ointments" was the subject of a paper by Ralph W Clark He contended that extensive research was required for determining a scientific base

William Gray referred to cold cream as a base C O Lee said that absorption of ointments is one of the subjects requiring further investigation K L Kaufman had completed a study of absorption of vitamins, in his experiments with white rats he experienced considerable difficulty in preventing them from eating the Ointment The reports were somewhat contradictory, he was of the opinion that this presented an interesting field for research and, if any were interested Mr Kaufman and he would be glad to submit their line of work

Sylvester Dretzka presented "The Professional Aspect of the Drug Store" He was of the opinion that something should be done to help those pharmacists who have been in practice for many years to catch up with modern ideas Perhaps lectures should be provided on pharmaceutical developments, post-graduate work could be arranged so that these pharmacists would realize the importance of their profession, this would help to reestablish pharmacy

He had used the "Open House" idea, inviting patrons and others to inspect the pharmacy, the visitors were interested and gained a better understanding of the work carried on by pharmacists He referred to an idea borrowed from the plumbers The Plumbers' Association sends men about the country to acquaint dealers and others with plumbing from the public health standpoint They contact the Chambers of Commerce Rotary Clubs, etc., and keep high salaried men busy all the time, the plumbers contribute toward this expense "Similar action," he said, "by pharmacists would be of benefit" Legislation is passed but when it comes to professional matters the legislators are indifferent

George L Secord said that when favorable legislation is passed, pharmacists should let the legislators know their action is appreciated

REPORT ON THE CHAIRMAN'S ADDRESS

Chairman H A Langenhan presented the report of the Committee on the Chairman's Address The report, with the exception of the action on the presentation of abstracts of papers is reported by Ralph W Clark *Delegate to the House of Delegates*, in the October JOURNAL, page 922 (This part of the Committee Report is made by reference to the former)

The following is abstracted in brief from the discussion H A Langenhan favored the submission of abstracts, not to exceed 250 words The chairman of the Section recommended that abstracts be not required—(see Chairman's Report at the beginning of the minutes of the First Session) (The Editor stated that abstracts of the Scientific Section were distributed, a few are left and those interested may obtain copies on request) H A Langenhan said that abstracts if distributed would enable the members to become acquainted with the presentations The following expressed approval of continuing the abstracts C O Lee, John Suchy, F F Berg, Charles F Lanwermyer

Chairman Burlage suggested, if the abstracts are continued, they be numbered as the titles of the papers on the program

Mr Langenhan said the requirements are—"if the abstract is not presented, the paper may not be accepted" Mr Clark stated that the abstract must be in the hands of the secretary After some further discussion it was decided to continue the abstracts

The reading of papers was continued "The Hospital and the Pharmacist Some Observations in Establishing a Department of Pharmacy," by H C McAllister H M Burlage read the paper and commented on the young man's experience and ability The pharmacy department of the Hospital had been a losing proposition The author pointed out the necessity of a competent pharmacist, as a result of the changes the dispensing service had been improved and made profitable

Ralph W Clark said the paper should interest pharmacists in hospitals William Gray stated that each hospital has its problems depending on the size of the hospital and the medicines

supplied, this paper shows that pharmacists in hospitals can make their services worth while. H A Whitney spoke along related lines, E T Motley had been a member of a committee to look into the number of pharmacists employed in hospitals and was surprised at the small numbers, he thought something should be done to improve that situation.

The following papers were presented by F F Berg, who commented briefly on them:

"The Stabilization of Milk of Magnesia by Citric Acid," E C Billheimer, F F Berg and F W Nitardy, "Comparison of Spectrometric and Antimony Trichloride Methods for the Estimation of Vitamin A Potency of Fish Liver Oils," W S Jones, F F Berg and W G Christiansen, "Study on Washing of Milk of Magnesia through a Permeable Membrane," E Moness, W A Lott, F F Berg and W G Christiansen, "Medicine Dropper to One Minimum per Drop," R A Konnerth, R E Schoetzw and F W Nitardy, "Assay of Liniment of Camphor," by D A Overby, R E Schoetzw and F F Berg.

The next paper entitled "Percentage Solutions" was presented by Earl Gunther, the author, who explained some of the points in percentage solutions and also brought out the details of prescription pricing, based on the Pacific Drug Review Schedule.

He was of the opinion that much must be learned by the pharmacist from practical experience and suggested that practical application should be made in the class room and that teachers should seek practical problems.

H M Burlage stated that he welcomed suggestions from pharmacists for class room study. The paper was further discussed by William Gray, W J Husa, Arthur D Baker and Mr Snelling.

The chairman presented "Studies on Three U S P and N F Preparations," by Henry M Burlage and W J Smith. Secretary Leon W Richards presided during the reading of the paper. The speaker stated that he impressed on the students the possibility of improving the methods of the standards.

The following papers were read by title: "The Preparation of the Resin of Podophyllum," Arthur H Uhl, "Hydrophile Petrolatum," Bernard Fantus and Hattie Dymewicz, "Improvement in Technique in the Preparation of Three Common Products," Edward D Davy, "Tincture of Opium—Process to Reduce Precipitation," P L Burrin and F E Bibbins, "Suggested Changes in Three Official Preparations," C L Cox, "Modernized Progress of Pharmacy in the Realms of Dispensing," C George Hamilton, "Errors in Methods Used for Testing Enteric Coatings," F S Bukey and C W Bliven, "The Percentage Preparation," Ralph Bienfang, "A Table of Equivalents," Ralph Bienfang, "It Can Be Done—Difficult Preparations Series No IV," J Leon Lascoff, "Pharmaceutical and Chemical Incompatibilities," George L Secord, "Chemical Stability of Anesthetic Ether—Formation of Aldehydes and Peroxides in Ether Stored in Containers not Sealed or Tightly Closed," J E Aurelius, E S Herlong and F W Nitardy, "Practical Pharmacy as Practiced in Free Hospital Clinic of Jefferson Davis Hospital of Houston Texas," F N Bono, also a paper by G A Newton (Not of record).

Chairman Burlage stated that if there was as much interest in the Section and as many or more papers, the Section would require more time.

E T Motley, as chairman of the Committee on Nominations, presented the following list of Nominees: *Chairman* L W Rising, *First Vice Chairman*, Frank L Black, *Second Vice-Chairman* H A K Whitney, *Secretary*, Leon W Richards, *Delegate to the House of Delegates*, H M Burlage.

There being no further nominations the nominees were duly elected.

Chairman H M Burlage thanked the members and expressed his satisfaction with the large attendance during the sessions.

On motion duly seconded and a vote the meeting was adjourned.

(The report of the Joint Session of the Scientific Section and of the Section on Practical Pharmacy and Dispensing is published in connection with the minutes of the Scientific Section.)

SECTION ON EDUCATION AND LEGISLATION

The First Session of the Section on Education and Legislation was convened, owing to the absence of Chairman Oscar E Russell by L Wait Rising, Secretary August 7th at 2 15 p m.

The following communication was read from Chairman Oscar E Russell:

Fellow Members

"Please do not consider this a learned address embracing all the phases of pharmaceutical education and legislation and a host of recommendations for future improvements

' Since my contact with this Section has been rather limited I do not feel qualified to deliver or write an address of this nature Please consider this as a message of greeting to those present and an apology for my absence

' It is indeed with very deep regret that unusual circumstances have made it impossible for me to be with you The program for this year's Section meetings seems to me to be unusually broad and comprehensive and from the titles of the papers submitted I would say they will be most interesting The entire credit for this very admirable program should go to your able secretary Mr Rising who I know has given much time and thought to its preparation I wish also to express my sincere thanks to those who have given their time and thought in preparing these papers

' In conclusion if I were to offer any suggestion whatever for your consideration it would be that more attention be given to the legislative part of our program than it has received in the past sessions It might be that the entire program of one of the sessions of the next meeting could be profitably devoted to this subject Again assuring you of my sincere regret in not being present

(Signed) OSCAR E RUSSELL, *Chairman*

The Report of the Secretary was read

THE REPORT OF THE SECRETARY

BY L W RISING

The secretary carried on the usual activities incident to the organizing of the annual program for the section No form letters were sent out from his office All the solicitation for papers was done by personal letters with gratifying results The wholehearted and willing cooperation of the persons contacted in making the work of the Section worth while and of real service to Pharmacy spoke well indeed for the character of the leaders in our profession

The 21 speakers represent geographically practically the whole of the United States coming as they do from North East South Middle West and West They are a true cross section of the ramified activities of the calling Among their number are educators state board members editors and men engaged in the commerce of pharmacy

Two new activities of the Section have been carried on this year by committees They are the work of bringing the dental profession in close association and cooperation with pharmacy and strengthening hospital pharmacy and its liaison with the profession as a whole These endeavors are worthy of the continued support of this body

The secretary desires to take this opportunity to publicly thank those who appear on the program for their efforts in behalf of pharmacy and the other officers of the Section for their aid in making his duties lighter

The report of the secretary on motion duly seconded, was accepted

The first paper "Educational Problems in Pharmacy," was presented by Dr H B Carey of the University of California (It will be published in a succeeding issue with comments)

Acting Chairman L W Rising appointed the following committees Committee on Resolutions—H A Langenhan *Chairman*, H A K Whitney, Leon W Richards Committee on Nominations—Ralph W Clark *Chairman*, Lewis C Britt E L Hammond

The next paper 'Fair Trade Legislation' was read by Frank E Mortenson (To be published)

The report of the Pharmacy Committee on Professional Relations pertaining to Dentistry was called for, it follows

REPORT OF THE PROPOSED NATIONAL PHARMACY COMMITTEE ON PROFESSIONAL RELATIONS PERTAINING TO DENTISTRY

BY GEORGE C SCHICKS *Chairman*

Unfortunately the resolutions passed by the Section on Education and Legislation last year were not presented to the Committee on Resolutions of the AMERICAN PHARMACEUTICAL ASSOCIATION in time to receive consideration

Chairman Oscar E Russell of this Section appointed the writer of this report chairman of the above mentioned Committee assuming its approval by the Council of the AMERICAN PHARMACEUTICAL ASSOCIATION. As it now stands there is no such committee unless we follow the suggestion to resubmit the resolutions again this year. With this in mind—

I recommend that this Section adopt the following resolutions so that they may be immediately passed on by the Committee on Resolutions of the AMERICAN PHARMACEUTICAL ASSOCIATION

"To the end that helpful information regarding ways and means of encouraging the prescribing of U S P and N F drugs and preparations by dentists be disseminated and made available to the pharmacists of this country, and to the end that the good work of one community or state may not be lost to other communities or states, therefore, be it resolved

That a Committee be appointed—to be known as the National Committee on Professional Information Pertaining to Dentistry. Its specific function shall be

First—to study the methods used by the various local, county and state organizations in their efforts to bring before dental men usable information on U S P and N F drugs and preparations

Second—To present to the pharmacists of the nation at our next annual convention a digest of constructive ideas gathered from such a survey and other sources

Third—The Committee is to act as a center for receiving and disseminating information which will increase the pharmacist's opportunities for professional scientific service to the dentist

Fourth—The chairman of the Committee is to be appointed by the incoming chairman of the Section. He in turn will add members to make it a workable committee "

Be it further resolved that the chairman of the Section on Education and Legislation appoint a committee to study the problem of cooperation with hospital pharmacists and their service to the allied medical professions

(See report of Committee on Resolutions in August JOURNAL, 1935 pages 711 and 713. Also address of the Chairman, July JOURNAL 1934 page 735)

REPORT COMMITTEE ON COOPERATION WITH HOSPITAL PHARMACISTS

BY ROBERT W. RODMAN, *Chairman*

In view of the fact that the resolution creating a Committee on Cooperation with Hospital Pharmacists, which was approved by the Section on Education and Legislation at last year's convention, was not received by the Committee on Resolutions of the American Pharmaceutical Association in sufficient time to permit confirmation, and thus has been unable to serve this Section in the manner outlined in the paper by the writer last year

My appointment as chairman of this Committee was predicated on the assumption that the Committee would be authorized by the parent body and since this was not done there has been no committee activity carried on

If the Section of Education and Legislation still feels that it would be well to investigate ways and means of extending the services of our group to hospital pharmacists in their problems, in a greater measure, I should recommend that the resolution creating this committee, as passed at the 1934 meeting of the Section be retransmitted to the House of Delegates of the AMERICAN PHARMACEUTICAL ASSOCIATION

On motion, duly seconded George C. Schicks was requested to forward the resolutions of the foregoing to the Resolutions Committee, A. P. H. A.

Reading of papers was continued. "Entangling Alliances" by Wortley F. Rudd (To be published)

R. A. Lyman commended the paper and stated that every one engaged in pharmacy had been troubled with the problems touched upon in the paper—that it presented problems that for 27 years had been discussed in an effort to work out some solution

The Green River Anti Peddling Bill" was presented by F. C. Felter

In discussing the bill Mr. Felter added, that in California they organized retail merchants and housewives and had legislation passed but later it was attacked by attorneys representing the various vending companies and that the Fuller Brush Company attempted to bring a test case

The merchants were able to organize the groups again, however, and the law is still on the statute books of some one hundred cities on the Pacific slope. Mr. Felter stated that he had prepared a sheet of suggestions and information and also an opinion from an attorney which had been sent out, together with copy of the bill, to all retail druggists inquiring for assistance.

C. B. Jordan asked how effective the law had been. The speaker replied that in Santa Cruz their experience was that during the first sixty days something like one hundred peddlers were brought before the court. He stated that they had the Green River bill on their statute books and, accordingly, the peddlers do not bother Santa Cruz. He said that enforcement, of course, is the greatest problem and at the same time, the bill's strongest feature, that its enactment and enforcement depended a great deal upon the cooperation of the housewife for the reason that the city officials have no record of peddling but the merchant's wife, clerks, etc., soon get on to it and when approached they call the police department and it is not long before the peddler passes the town by.

Mr. Felter mentioned some letters he had received from Mr. Rutherford on the subject which he said were very enlightening and stated that the retail merchants' housewives etc., should work together for a common purpose.

R. L. Swain inquired if any attempt had been made to pass a state law of this character. The speaker had no knowledge of a state law. The former then stated that a bill of this character had found its way into the legislature of Maryland at different times and that among seven or eight bills endorsed by pharmacists in the legislature it was the only one that had found its way in and then out (unsuccessful) and cited cases where peddlers would purvey concoctions of small value from door to door at prices of \$2.50 to \$5.00 a pint or quart unlabeled. He told of efforts of lobbying companies with the county health officers and boards of hygiene to kill the bill, and stated there seemed no limits to which they did not go.

Mr. Felter stated he felt it was necessary to first get the measure into effect in small towns and municipalities—that any objections of city councils must be overcome and in that way it was not difficult.

Mr. Swain thought the measure a sound one and his idea in bringing up the question of state passage was curiosity to know if any states had been successful in establishing such a law. Mr. Felter cited other cases.

General discussions brought out that medicines and articles of doubtful value and of very low manufacturing cost were sold in house to house canvassing at exorbitant prices.

The next paper, "Presentation of Basic Sciences in Colleges of Pharmacy," was presented by T. C. Daniels, the author. He concluded his paper by stating that he felt we should follow up the basic sciences with proper application when students are prepared for it, but not until then.

Ernest Little stated that he had expressed his idea on the subject quite thoroughly in his address although he felt that Mr. Daniels had gone a step further, he concurred in Mr. Daniels' opinion that with the four-year course the students have an adequate amount of time, which was not the case with two- or three-year courses.

C. B. Jordan called attention to the method of instruction citing methods used by C. J. Klemme in making application at the time of teaching the basic sciences and touching upon success with which he had met.

H. B. Carey stated that experience had taught him that an average student has a very moderate capacity and that if he were able to grasp one point at a time on the subject presented he was doing exceedingly well, that the average student wanted to see the application of that in which he was interested. He would become absorbed in it and lose the point of the reason and basic understanding of the topic. He felt from an educational point of view the subject should be presented so as to develop the student's idea of reasoning, regardless of application, that if he were able to use his head—could walk alone—that he could take care of himself and that that was the basis of the procedure he recommended.

On motion, duly seconded, the First Session of the Section on Education and Legislation was then adjourned.

SECOND SESSION

The Second Session of the Section on Education and Legislation was convened August 9th, at 9:00 A. M., by L. Wait Rising.

The chairman announced that none of the authors of the remaining papers were present, they would be read by title, unless there was objection (Titles of all papers are printed in July JOURNAL, page 593)

(Minutes of the Joint Session with the Section on Education and Legislation, Conference of Pharmaceutical Law Enforcement Officials and Pharmaceutical Association Secretaries, will be published in the same issue with the proceedings of the Conferences)

Claire A Dye stated that a paper by George C Schicks on "National Unity of State Cooperation between Pharmacists, Physicians and Dentists" had been read by title, and as the author was present, he asked for the reading of the paper (It will be published in the December number of the JOURNAL) The paper was read and action taken in accordance with report of the First Session

H E Kendig asked the author whether consideration had been given to the method of raising the money in order to establish such a bureau The author replied that this had not been gone into The discussion had brought about a very favorable feeling toward the creation of such a body for laboratory work, special information to pharmacists etc The Council had been advised of the action, and the pharmacists throughout the country are desirous for the establishment of such a bureau It is hoped that the Council will find a way to give needed information, even if the laboratory is not established at once He knew where the money was coming from in his State—that the medical men were very willing to contribute a part, as they were desirous to keep the bureau going—the medical men are just as eager as the pharmacists

H E Kendig stated that inasmuch as L W Rising had a paper among those included by title he would be interested in hearing it read and the chairman stated that he would give a short résumé of his paper

The subject dealt with the idea of selling pharmacy to the general public by advertising the profession through the medium of increased apparatus in the prescription department and to make that increased apparatus visible to the public, not an open prescription department but rather adding to the extra equipment that pharmacists do not usually have for prescription and manufacturing purposes For instance, he thought it would be a good idea for all pharmacists to have a sterilizer of some sort in the prescription department He stated that it would serve two purposes—it would be an efficient piece of equipment and a good advertising medium as well He believed the public is impressed when they see a thing of that sort particularly when it is in operation He pointed out that beauty shops used displays of scientific-appearing apparatus and that the patrons were impressed by such equipment—would patronize the stores displaying such apparatus more readily than they would one with less efficient equipment He also called attention to preference of garages with modern equipment stating that it created the idea and atmosphere that those garages are progressive Doctors' offices where slum equipment is displayed create the idea that the office is up-to-date and that he himself, would have more faith in that doctor than he would in one whose office was not well equipped, although the latter might in reality be a better physician It was a psychological problem The pharmacists should invest in equipment and apparatus for manufacturing purposes, have the prescription rooms well equipped to do their manufacturing operations and to place such equipment out where it is feasible to make use of it in some of the minor technical operations of manufacturing There were two aspects to this suggestion one a psychological and advertising aspect and the other, a practical side

H E Kendig thought Mr Rising's idea a splendid one, looking at it from a psychological point of view He felt that it would establish in the minds of people the idea that there was more to pharmacy than cheap merchandising in the window It would create a good impression and that it would do as much to establish pharmacy on the scientific basis in the minds of the rank and file of people as the activity of the various pharmacists and the tremendous effort put into Pharmacy Week

S J Hall stated that he had a retail store in which he had an open prescription room and whenever they were doing any distilling filtering, etc or anything that would appeal to the public it was always done in a place where it could be seen

George C Schicks believed that when advantage is taken by the pharmacist in having scientific apparatus displayed in his store he is taking advantage of one of the greatest advertising possibilities that is within his power to obtain He had seen that work out as he had gone into a professional store equipped in such a manner with apparatus which could be seen readily from the front of the store Two ladies came in with prescriptions and they looked at this apparatus

and commented that they had never seen that in a drug store before. They had no idea that a pharmacist used that kind of equipment. The pharmacist took a few minutes of his time explaining the action of the sterilization machine and incidentally brought into the conversation other points. He did a good job of selling the scientific part.

S J Hall referred to the attractive windows of Frank Nau's pharmacy, stating it was well worth one's while to see them, he had many compliments on his windows, and received recognition at different times in national publications.

A paper not listed on the program was included among the papers of this Section, entitled 'Estonian Pharmacy Forges Ahead,' by Rudolph Wallner.

E L Hammond reported for the Committee on Nominations as follows: C Leonard O'Connell, *Chairman*, Vice-Chairman, G C Schicks, *Secretary* George A Moulton, *Delegate to House of Delegates* L Wait Rising.

Claire A Dye moved that the report of the Committee on Nominations be received and the Chairman instructed to cast a unanimous ballot of the Section electing the officers nominated. The motion was duly seconded and unanimously carried.

There being no further business before the meeting the Section was adjourned.

SECTION ON HISTORICAL PHARMACY

The First Session of the Section on Historical Pharmacy was convened by Chairman C O Lee at 2 00 P M, August 7th. The first order of business was the reading of the Chairman's Address, it follows:

KNOWING THE HISTORY OF ONE'S PROFESSION

BY C O LEE CHAIRMAN

It is hard to believe that there is more fascinating reading than that which is to be found in the many interesting books written upon the history of medicine, pharmacy and science. They present a panorama of man in his struggles to move up and out of conditions in which he found himself. In an effort to rid himself of suffering, primitive man tried those things near at hand. Among them were cool leaves, roots and herbs. The story of man's use of, and belief in, all sorts of substances as medicinal agents to relieve pain, is a story that is as old as man himself. It is a fascinating account of human progress.

Sarton says "When one reads the history of science one has the exhilarating feeling of climbing a big mountain" (1). The reading of pharmaceutical history often stimulates the reader but there are also depressing spots in it. In meditating upon the depressing pages of history I have often wondered how progress was at all possible.

Like religion, medicine and pharmacy have survived the influences of terrible superstition and ignorance. In saying this I do not mean to imply that these retarding influences have all disappeared, for they have not. There is reason to believe however that we are much more enlightened upon the subjects of science and religion notwithstanding the fact that some folks still choose to believe irrational and unwarranted things about either or both.

There are at least two good reasons for studying the history of pharmacy or any other science. One is purely a historical reason, the other for the purpose of understanding the science. If one really knew the history of pharmacy through the ages he could chart a reasonably accurate account of the political and social struggles of civilization through centuries of progress. Then too if pharmacists knew the long and interestingly fascinating history of their chosen profession they would be much prouder of it than the average druggist seems to be.

Not so long ago the writer placed a chart of famous pharmacists and their discoveries before a class in the history of pharmacy. It was pointed out that pharmacists, one hundred and twenty years ago, were discovering the alkaloids and various other important compounds and elements. In discussing the fact that pharmacists are not in these days, known for their famous discoveries a member of the class suggested that they are too busy selling cigarettes and soda water. We fear that there is too much truth in the suggestion a situation which is in serious need of improvement. A knowledge of the history of pharmacy is of prime importance to pharmacists and scarcely less so to the historian. It would be of great interest and value even to the laity.

In the introduction to 'Sixty Centuries of Health and Physic,' is to be found the following interesting statement "In order to understand properly a man, an art, or a science, a knowledge of their development and past history is essential, what embryology is to the study of man's structure and evolution, history is to the comprehension of an art or a science" (2) Following up the suggestion of this quotation we find it hard to reconcile a noble professional past with a present doubtful one Even so, pharmacy, as we know it to day, shines through and beyond a lot of commercial trappings as a profession It is truly a science and an art

The Section on Historical Pharmacy was organized in 1902 and has held one or two interesting sessions at each of the annual meetings of the ASSOCIATION since then By a rough count it would appear that about five hundred papers have been presented before the sessions of the Historical Section They have stimulated much worth-while comment and discussion A number of the papers have been printed It is to be regretted that they have not all appeared in print By the persistent efforts of a few members, devoted to the cause of historical pharmacy, the Section seems, now, to hold a position of wholesome respect and interest in the ASSOCIATION

The historical accounts that have been presented to the Section have come chiefly from those primarily interested in the subject There is a certain pleasure to be had in searching for facts and the truth behind them Instead, however of depending for our history upon just a few interested individuals we need to do more sowing of the spirit of historical research in our schools and colleges G F Milton has recently said that the writing of history is a science, an art and a profession He continues by saying, 'In its scientific aspect history writing involves the discovery of sources the appraisal of data, the search for the causes as well as the consequences of events' (3) In the light of such an estimate of history we need to look to our schools for better training in the subject

In a recent survey of the pharmacy catalogs I was impressed with the meager amount of time allotted to courses in the history of pharmacy Even more discouraging is the fact that some schools entirely ignore the subject Our curriculum makers need to be apprised of the importance and value of a study of the history of pharmacy and science We would do well to heed the following statement by Seelie — 'The opinion of medical educators is unanimous, regarding both the practical and cultural value of the study of the history of medicine' (4) If it is good for medicine and science it is also good for pharmacy

In taking account of the many interesting books which have appeared in recent years upon the history of medicine and science, it is to be regretted that pharmacy, in America at least, has not gotten its share of attention by the historical writer It is our duty to see that this situation is changed in the direction of a more wholesome understanding and respect for a time honored profession

During the past year or two your Chairman has been engaged in compiling the doings of the Section, chronologically into three divisions as follows (1) The minutes of all the sessions, (2) the resolutions passed upon and (3) the titles of all papers presented before the Section together with their authors It must be understood that no claim to absolute accuracy is made in these compilations They are offered to the historian as a beginning, or as an aid in the assembling or tabulating of the work of the Section into a more readily available form than we now have

RECOMMENDATIONS

Your Chairman wishes to recommend

(1) That the Historical Section ask for the appointment of a committee of three to be made in the regular way, whose duty it shall be to study the history of pharmacy courses now being offered in our schools and colleges, giving special attention to the scope time and contents of such courses, and to bring a report of its findings to our next annual meeting

(2) That the AMERICAN PHARMACEUTICAL ASSOCIATION by proper means, classify edit and publish the papers which have been presented before the Historical Section in an effort to create interest in the subject of the history of pharmacy and to make more readily available the information contained in the papers which have been presented from time to time

(The records prepared by Chairman Lee are comprehensive and valuable and will serve a useful purpose. They represent research which should, as far as possible, be made available—HISTORIAN.)

The following resolution was approved by the Section

RESOLUTION FROM HISTORICAL SECTION TO THE HOUSE OF DELEGATES

It is recommended by Chairman Lee

(1) That the Historical Section ask for the appointment of a committee of 3, to be made in the regular way, whose duty it shall be to study the history of pharmacy courses now being offered in our schools and colleges giving special attention to the scope, time and contents of such courses and to bring a report of its findings to our next annual meeting

(2) That the AMERICAN PHARMACEUTICAL ASSOCIATION, by proper means, classify, edit and publish the papers which have been presented before The Historical Section, in an effort to create interest in the subject of the history of pharmacy and to make more readily available the information contained in the papers which have been presented from time to time

H. W. YOUNGKEN, *Secretary*

REPORT OF THE SECRETARY

BY HEBER W. YOUNGKEN

Your secretary has sent out letters to about 250 members, soliciting papers and, in addition, has seen to it that due notices of the meetings have appeared in the JOURNAL OF THE ASSOCIATION. It is gratifying to note the fine response to his solicitation and especially the varied character of the topics which were selected by the contributors to this year's program of the section.

It has been a genuine pleasure to him to have worked with such helpful and enthusiastic associates as Chairman Lee and Historian Eberle.

The report was accepted

The Report of the Historian was presented. It follows

REPORT OF THE HISTORIAN

BY E. G. EBERLE

This is an eventful year for pharmacy in Europe and it is unfortunate that American pharmacy is not represented as it should be, partly due to the sudden illness of Charles H. LaWall, a former president of the AMERICAN PHARMACEUTICAL ASSOCIATION, who was named as a delegate to the pharmaceutical meetings in Brussels and by the U. S. Treasury Department to attend the sessions of the Committee upon Uniform Method of Opium Assay, in Copenhagen, which has been working under the auspices of the Health Committee of the League of Nations since 1931.

The ninth general assembly of the International Pharmaceutical Federation was held in Brussels on July 29th and 30th, and the International Congress of Pharmacy from July 30th to August 6th. The Eighth International Congress of Military Medicine and Pharmacy was convened in Brussels from June 27th to July 3rd. Among the subjects considered at the latter were

"Principles of Organization and Function of the Medical Service in Mountain Warfare," "Determination of Aptitude for the Various Specialties in the Medical Services of the Army, Navy and Air Force," "Sequelæ of Wounds of the Abdomen," "Researches Concerning Standardizations of Methods of Analysis of Foods and Drinks for the Use of the Soldier," "Buccal Dental Prophylaxis at the Front," "Comparative Study of the Medical Administrative Services of Various Armies, Navies and Air Services."

The following titles indicate the work of the Congress of Pharmacy

"The Standardization of Oestrin and Male Hormone"

"The Stability of Strophanthin Solution"

"Structural Standards for Crude Drugs"

"Halogen Analogues of Ephedrine and Adrenaline"

"A Critical Study of the Methods of Assay of the Alkaloids in the Official Preparations of Belladonna in the Belgian Pharmacopœia, 1932 "

"Research on the Sterilization and Biochemical Control of Pharmaceutical Products "

' Criticisms on the So called Chemical Reactions of Cannabis Indica "

' The Problem of Unifying Pharmaceutical Nomenclature in an International Pharmacopœia '

Among the subjects that will be considered at the Twelfth International Congress are the following The medico pharmaceutical scope, the limitation of pharmacies, pharmaceutical regulations—control of patent medicines and prices to be charged, management of pharmacies pharmaceutical service in social insurance, the question of employment in pharmacies, pharmaceutical terms

The King and Queen of Belgium will attend the opening meeting of the pharmaceutical conventions

Through the courtesy of Major General H L Gilchrist, editor of the *Military Surgeon*, the Library of the AMERICAN PHARMACEUTICAL ASSOCIATION has received reports on the Congress of Military Medicine and Pharmacy for 1923, 1925, 1927, 1929, 1931 and 1933 All of the foregoing reports were made by William Seaman Bainbridge, Captain M C F, United States Naval Reserve These meetings were held consecutively in the order given above, in Rome, Paris, Warsaw, London, The Hague and Madrid

The AMERICAN PHARMACEUTICAL ASSOCIATION in the American Association for the Advancement of Science is a step in progress and is entitled to mention in this report An interesting program was carried out at the Minneapolis meeting in Section N (Medical Sciences and Section N3 (Pharmacy)) Reference is made to page 328 of the April JOURNAL

The Pharmacy Exhibit was brought to a close as far as the Chicago World's Fair is concerned and report will be made by Chairman H C Christensen but a mention should be made as part of history

Esther H Barney, who so efficiently supervised the exhibit, donated a beautiful framed picture of it in color Council action will be taken on her valuable services and others who were outstanding in their activities

In conformity with the general plan of A Century of Progress, the Pharmacy Exhibit was arranged to appeal to the layman, and under the direction of Chairman H C Christensen and the committee having the arrangements in charge the exhibit successfully met the test, attracted the interest of the visitors and received general favorable comment from them

Brazil gave recognition to the Exhibit by presenting the AMERICAN PHARMACEUTICAL ASSOCIATION with a Diploma The writer does not anticipate Chairman Christensen's report but the exhibit or part of it will find place in the Museum of Science and Industry the Rosenwald Museum in Jackson Park Chicago

The Stabler-Leadbeater Apothecary Shop now the property of the AMERICAN PHARMACEUTICAL ASSOCIATION, will be converted into a museum, some work in the restoration has been done, but is only a beginning the front now gives an idea of the appearance when the founder established the Apothecary Shop

The interest of collectors in drug jars is shown in the exhibition at the American Art Association—Anderson Galleries of the collection of the late John Wanamaker The latter display was in the home of Mr Wanamaker on shelves which have been brought to the Museum, the containers are traced back to the Middle Ages and were made at the great pottery works of that period By sales these are now at various places and would serve a better purpose if a selection would be permanently exhibited in the Museum of the AMERICAN INSTITUTE OF PHARMACY A number of articles on mortars have been published in the JOURNAL since the last meeting of the ASSOCIATION

The *Bulletin de la Société d'Histoire de la Pharmacie* (France) for March presented a statement from the pharmacy of J B Caventou for 'La Dame aux Camélias' from the collection of P Lemay The bill head carries the inscription and face of the medal of award by the Royal Institute of France of the grand prize for the discovery of quinine sulphate by Pelletier and Caventou There is further interest attached because only two of the novels of Dumas, the younger, survived one of these 'La Dame aux Camélias' from which book came the immortal drama by the same title

Through a grant from the Carnegie Corporation and with the coöperation of the School Art

League, the Folk Arts Museum at Riverdale is open to the public, Mrs Eli Nadelman is the director Walter Rendell Storey contributed an illustrated article to the *New York Times Magazine* for April 28th on the museum, in which are ensembles of furnishings, including an early American Pharmacy, with shelves counters bottles, jars, some still full of old herbs and drugs Other types of displays are described

The Academia Nacional de Medicina of Madrid celebrated recently its second centennial The festivities included several meetings during the medical week and an exhibition of the books of the library, which has among other books of great importance, the "Codex scientie medicine of Avicenna," in five large volumes and a collection of books written by Hipolito Ruiz on American plants, which for more than three centuries were a source of information for botanists and designers from all over the world

The library of the AMERICAN INSTITUTE OF PHARMACY is developing and members have an opportunity in aiding this service by the donation of books pertaining to pharmacy and allied sciences The library has rendered service to divisions of the Government and departments have found desired information in its volumes, also individuals and schools The mails frequently bring requests for information and it is gratifying that in most instances it has been possible to render service

The History of Science Society held its December meeting in the AMERICAN INSTITUTE OF PHARMACY and for this occasion several show case displays were arranged of books dealing with the history of pharmacy which attracted the attention of the visitors and interested them A related effort in display was made when the Round Table Medical Club held its January meeting in the building, a number of changes were made in the display and this was held over for the visit, on February 9th of Phi Delta Chi delegates to the conclave in Baltimore hailing from Massachusetts, New York, Nebraska Maryland, Ohio, Iowa, Idaho Kentucky, Colorado, North Carolina, Oklahoma New Jersey and California

Dr C A Browne, chief of chemical and technological research of the United States Bureau of Chemistry and Soils has officially established 1635 as the date of the birth of American chemical work Then John Winthrop Jr, founded the industries that are now so vital to national defense and form so large a source of national wealth

The centennial of graduation from University of Georgia by Crawford W Long physician pharmacist was celebrated in Athens March 30th Many references to him may be found in the JOURNAL, among them 13, 51 (1924) 15 317 (1926) 17, 517 (1928)

The 30th annual meeting of the American Association of Museums was held in Washington D C, headquarters at the Smithsonian Institution, May 23-25 1935 The AMERICAN PHARMACEUTICAL ASSOCIATION is listed among the museums in Washington

Golden anniversaries were celebrated this year by North Dakota Pharmaceutical Association Chicago Retail Druggists' Association Tennessee Pharmaceutical Association

These references could be carried along for many pages, but in this report must be limited, and re reading of JOURNAL articles will serve for more extended research

The articles by Lyman F Kebler and F W Nitardy recently published, emphasize the important part that the AMERICAN PHARMACEUTICAL ASSOCIATION had and has now in Pure Food and Drug Legislation

A recent Supreme Court decision makes an historical reference to the drug codes It evidences that the drug industries and pharmacy were eminently successful in the management of the respective offices

DONATIONS

The preceding Historian's Report reported earlier donations and items in the JOURNAL speak of others In an effort of this kind there is a possibility of omitting some that should be mentioned Thanks are extended to all who favored the Museum and the Library recognition is given in the JOURNAL and an appeal is made for historical matter and books for the Library Since last report and not published the ASSOCIATION has received from Mrs Harvey W Wiley a number of books and Pharmacopoeial circulars and letters of the years during which Dr Wiley was president of the Pharmacopoeial Convention The donation by Will of Frederick B Kilmer is made of record in Council Letters and official action has been taken A donation for a complete projectoscope has been made by Mr and Mrs J C Peacock, reported by Council

IN MEMORIAM

The following have served pharmacy and record is hereby made of work well done, in memory of the deceased we pause for a moment, among them are George F Bigham, W E Bingham, Charles M Blaney John Block, W L Cliffe, Charles I Clough, Edward S Dawson, Joseph H Dow, R G Eccles, P J Garvin, Raymond Hendrickson E D Irvine, Hugo Kantrowitz H C Kassner, Ervin F Kemp, Ezra J Kennedy, F B Kilmer Robert R Lampa, Robert H Land, Herman A Metz, Otto Paul Meyer, Willard Ohliger, Roy C Reese, J Percy Remington, Van Amburg Sandles, J P Schoenthaler, Israel Shurtleff, E B Shuttleworth C P VanSchaack, L S Williams, Smith C Wilson The passing of five faithful State officers was reported in one issue of the JOURNAL December 1934

The names are given in alphabetical order, brief notices are printed in the JOURNAL

Mention is made of the following, because of prominence in pharmacy in other countries or of their relation to pharmacy A H Jenkin, treasurer of the British Pharmaceutical Society, John E Graff, one of the founders of Rhode Island College of Pharmacy, Dr Philipp Fischels, father of the President of the A Ph A, Edgar A Ridgely, president of Indiana Pharmaceutical Association, Hon Clyde Kelly, friend of pharmacy, Dr Wilhelm Kollé, director of the State Institute for Experimental Therapy and Chemiotherapy Research Institute Frankfurt, Dr L Winkler, president of the Society for the History of Pharmacy and lecturer for History of Pharmacy University of Innsbruck, Marion Dorset, biochemist, Dr Hugo DeVries, world famous botanist

The report was received for publication

The following papers were read A Brief History of the Drug Code," E F Kelly (Published in September JOURNAL, pages 767-770) "Pharmacy and a Commemorative Stamp," illustrated by lantern slides, F A Delgado "The First Pharmacist in North America," Theodore J Bradley William Withering and the Introduction of Digitalis into Medical Practice " Louis A Roddis Moses Maimonides, Physician and Author of Medical Works," Louis Gershenfeld "David Henshaw—from Druggist to Secretary of the Navy," George E Éwe "John Marsh, a Medico Pharmaceutical Practitioner on Six Frontiers," Edward Kremers "Early Drug Stores in Oklahoma," Loyd E Harris "The Pharmacopœia of 1880," L M Parks "The Massachusetts Pharmacopœia of 1803," H Niles "The Californian Indians, Their Medical Practices and Their Drugs" John Culley "Estoman Pharmacy," Rudolph Wallner "Development of Pharmacy in West China," E N Meuser (Published in the October JOURNAL, pages 865-867)

The Chairman appointed a Committee on Nominations

SECOND SESSION

The Second Session of the Section on Historical Pharmacy was convened by Chairman C O Lee, August 8th, at 9 00 A M

The reading of papers was continued

The first paper was "State Association Secretaries arranged in order of service," by J G Beard (Read by title, no discussion)

The next paper was "Medical Practices of the New England Indians," by Will T Bradley (Son of Dean Theodore J Bradley)

Theodore J Bradley said there are two papers on Indian Medicine in the extreme ends of the country—this, and one by John Culley entitled "The California Indians Their Medical Practices and Their Drugs"

Mr Bradley commented on the paper and the research in preparing it He hoped a paper on Southwestern Indians would be presented next year

E H Niles suggested that these papers should be published in book form

Several members expressed a hope that these papers would be published in the JOURNAL Theodore J Bradley stated that if the paper by Will T Bradley is not published, he would see to it that it is printed and distributed to those interested in the subject

Reference was made to the records prepared by Chairman Lee and the valuable information contained in unpublished papers, hence, an effort should be made to publish them for the courses in historical pharmacy

The papers were accepted

'Pioneers of Pharmaceutical Education," by E T Stühr, was read by title

The following papers were read by title "A History of Dentifrices," Martha E Faulk "Apothecary Shops of Colonial Times" Millicent R LaWall "Medicine Making as Depicted by Museum Dioramas" Charles Whitebread "Honoring Age and Service," John E Kramer "Report of the Pharmacy Exhibit for 1933 and 1934" H C Christensen "Drugs of the Bible" A R Bliss, Jr "The Ancient Medicinal Uses of Gems and Precious Stones," A R Bliss, Jr

"History of the Dorfinger Show Globes" was presented by R W Rodman The comment by the author is abstracted from the reporter's notes I prefer to tell the story than present a formal paper, which I will prepare for the JOURNAL in the form of an article, with illustrations I have some which I must return and must have them copied to submit with my paper to you My story is nowhere near as profound as the one just heard from Dean Bradley It is a very simple story, one which has been of considerable interest to me, and I hope it will be to you

There is an old glass factory which is now in decay, that was started by one John Dorfinger in 1852 He set up his first glass works in New England in 1863 Fine glassmaking interrupted his retirement and he set up a small factory which rapidly grew until it consumed a space of over an acre of land That glass factory grew to be one of the finest glass factories in this country, it made fine glass etchings The design of the Cuban Palace occupied the full time of twenty glass blowers and etchers to complete that set of dishes He also made glassware for Royal families in England

"The great war interrupted the activities in the plant but it was not until after 1921 that the factory was closed One son bought the entire plant and stock of glassware which was left from the other heirs and decided to set up a small antique glassware shop One entire section was filled with these beautiful apothecary show globes, at a period in American Pharmacy when the show globe was not enjoying a place in the affections of the people where it finds itself to day There was no market for show globes Consequently, it was a problem what to do with these show globes—pack them up and count them as a loss or was there something he could do with them? He thought the matter over for a few months before he could devise a plan of realizing any money from them at all Then he got an idea He went to New York City to John Wanamaker's and talked with a buyer and interior decorator They planned together to separate the globes filling the bottom one with fluid and wiring them for living-room lamps, and the small ones they converted into boudoir lamps They put them on display and they had a ready appeal to the public, and within six months the entire stock of these gorgeous Dorfinger show globes had been converted into lamps and reached the homes of American families Shortly after all the show globes had been disposed of pharmacy had a demand, and druggists who did not have show globes wanted them Such a demand had been created for them that they were sold to Wanamaker for about a dollar apiece and to day they cannot be purchased for \$50.00 a pair In the L S Williams collection they have a number of these bottles and in the paper which I present to the ASSOCIATION I will have considerable technical material which will enable anyone to identify the Dorfinger show globes'

H C Christensen presented a synopsis of a paper entitled 'Report of the Pharmacy Exhibit for 1933 and 1934' He had brought a whole book full of historical documents and entitled this Part One of the Pharmacy Exhibit

Secretary Christensen said his idea was to 'carry on' and the report he presented speaks of the origin of the idea and general outline of the plan Photographs are included with notations on what they represent and their part in the exhibit There are also included lists of contributors and of the revisions in the pharmaceutical activities represented also releases sent to the publications at different times for publicity and a number which carried descriptions of the Fair

There are photostatic copies of reprints, comments on the exhibit from various papers and especially those of Chicago There are also included circulars in which the Pharmacy exhibit is mentioned The exhibit was part of the Medical Science Division in the Hall of Science, where it received recognition on an equal basis with other sciences and the exhibit was pointed to as one of the most interesting and attractive in the Building

Dr Eben Carey in charge of the Medical Division included in his description publicity articles sent out relating to the Pharmacy exhibit and referred to it by saying that the AMERICAN PHARMACEUTICAL ASSOCIATION would show the development of Pharmacy

The Catalog is included in the Hall of Science in which the Pharmacy exhibit was listed,

with the cut of the exhibit shown in the book, together with an article on it. There are other matters of interest which will be added from time to time.

The Pharmacy exhibit has been included with sixteen other medical science exhibits to be installed permanently in the Museum of Science and Industry in Jackson Park where the 1893 Fair was held.

Mr. Rosenwald, who died several years ago, endowed this institution with about \$2,500,000 and the city of Chicago voted an equal amount. In that division of the Museum there will be the sixteen medical science groups represented and the privilege is given to add to, from time to time, and make such changes as may be necessary. The set up will be along the same lines with the historical division. There will be a modern prescription and chemical counter and other exhibits that were shown at the Fair. The arrangement will be somewhat different. There will be included the old Philo Carpenter pharmacy and old utensils will be shown within the log cabin. The Chicago Historical Society has agreed to help with the proposition, they have pictures and plans of the old store and a good many of the things that were in the store.

The original plans of the Exhibit were based on about \$50,000.00 but this estimate could not be reached. From the amount collected there is left \$596.92, which will be used in the preliminaries of installing the exhibit in the permanent museum. The Museum, however, will take over all the expenses. There will be no charge for space and nothing for the installation. It will be permitted to place from time to time other historical material. Some of this may have to be paid for, the amount therefore, has been left open so that the preliminary expenses can be met. The idea of the Exhibit was first mentioned in the Chicago Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION.

The resolution for preparing the Exhibit was passed at a special meeting by a motion directing that the AMERICAN PHARMACEUTICAL ASSOCIATION have supervision. In 1930, as President Mr. Christensen appointed delegates for the different national associations and another meeting was held to talk over preliminary plans and purposes and a committee was appointed, of which he was made *chairman* and he was given permission to go ahead with the proposition.

The report up to now is considered as the first part and additional matter can be added to from time to time. The report was accepted.

Being asked whether the report will be published in book form, Mr. Christensen said that perhaps when the report is complete this will be done.

The Museum has between ten and twelve acres of floor space, part of the exhibit material has been temporarily placed, next to the office of the National Association Boards of Pharmacy.

Mr. Christensen said that few realized fully what this exhibit really has meant. It has been recognized on the same basis with those of other sciences and now has been placed or will be placed permanently, in an institution where the exhibit of Pharmacy will be seen by millions of people. He mentioned that a million and a half of people visited the exhibit, of which there were 110,000 registered pharmacists, physicians and dentists. There were registrants from every state in the Union and from twenty six foreign countries. There were notables from various foreign countries and it represented a strenuous effort for the Local Committee to make the proposition worth while. He hoped the material may at some time be published in book form.

The report was accepted.

The following papers were read by title: "The Pharmaceutical Museum at the University of Minnesota," F. J. Wulling, "Mandragora," W. H. Blome.

Chairman Lee stated that Secretary Youngken had a paper he would like to present and he was asked to read it.

The secretary stated that the paper had been given to him by the Historian. It represented a rather rare and most valuable contribution to the history of drugs and for that reason it was presented here. Accompanying the paper were two pamphlets concerning the "Badianus Manuscript," an Aztec Herbal 'Codex Barberini' Latin 241 (Vatican Library) prepared by Dr. Emily Walcott Emmart of Johns Hopkins University. (The paper is published in the September JOURNAL, pages 771-774. See also October JOURNAL, page 928.) Chairman Lee said in accepting the paper that this is an interesting account of pharmaceutical history. He regretted that not more of the authors were present to read their papers.

The report of the Committee on Nominations was presented by Chairman Edward H.

Niles as follows *Chairman*, H W Youngken, *Secretary*, Loyd E Harris, *Delegate to the House of Delegates*, C O Lee, *Historian*, Eugene G Eberle

There being no further nominations, the nominees were duly elected by unanimous vote

Chairman Lee congratulated Chairman elect Youngken and acknowledged his services as secretary The latter expressed his appreciation of the work done by the retiring Chairman

E H Niles suggested that all authors present their papers in duplicate

C O Lee suggested that the duplicate copy might be bound in heavy paper and that this copy be used for loan to teachers and others

Chairman Youngken referred to copies on various subjects prepared by the Department of the Interior

Reference is here made to the compilations of Resolutions of the Section from the time of its organization and of the Resolutions The compilations cover many papers and are in the hands of the Historian The statements relative thereto signed by Chairman Lee follow

MINUTES, HISTORICAL SECTION OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, in brief including recommendations, motions and the titles of papers with the names of the authors, in so far as we have been able to find them

This work has been done in an effort to assemble, chronologically, the doings of the Section since its organization in 1903 up to and including the 1934 meeting

It is suggested that these are not without error and should not be accepted as final without being carefully checked and re edited

RESOLUTIONS HISTORICAL SECTION OF THE AMERICAN PHARMACEUTICAL ASSOCIATION These resolutions have been assembled chronologically in an effort to make it easily possible to know the past actions of the section There are doubtless many errors and omissions They are offered for whatever value they may serve

Motion was made and duly seconded that the Section on Historical Pharmacy adjourn—
Carried

PLANT SCIENCE SEMINAR

The thirteenth annual meeting of the Plant Science Seminar was held in Portland, Oregon, the week of July 29, 1935 Sessions were held at the North Pacific College of Oregon with Chairman Frank H Eby presiding Dean A O Mickelsen of the North Pacific College gave the address of welcome

The regular sessions were devoted to the reading of papers and round table discussions on cultivation of medicinal plants, teaching methods, laboratory technique and other subjects interesting to those engaged in the study of medicinal plants

The following papers of unusual interest were presented, "An Economical and Safe Apparatus" by Bernard Melkon, 'Studies on Phytolacca I Morphology of Young Inflorescence' by E H MacLaughlin, 'The Importance of the Library in Teaching Pharmacognosy' by Frank H Eby, 'The Kilmer Memorial Garden' by Marian S Dunn, 'Digitalis Assay' by E B Fischer Each of these papers was followed by a general discussion

Professor Ernst T Stuhr of the Oregon State College School of Pharmacy, gave a very fine address on Commercial Drug Plantings in Oregon By means of an excellent set of maps he explained the climatic and soil conditions of the entire state of Oregon He discussed the cultivation of Cascara Ginseng, Hydrastis, Mints, Artemisia, Hops and other drug plants Professor Stuhr stated that Cascara is being cultivated on a very small scale Ginseng and Hydrastis are cultivated chiefly in the region of Escatawa Digitalis flourishes as a weed through much of the eastern area of the state Artemisia and the mints are cultivated only in small areas

Professor E N Gathercoal discussed a series of studies which have been conducted on Senega and Poplar Buds in the University of Illinois, School of Pharmacy A very interesting set of charts, drawings and photomicrographs prepared by Professors E H Wirth and P D Carpenter were placed on display and discussed by Professor Gathercoal A model of a section of the wood area of a typical Senega root prepared by Professor Carpenter was the outstanding exhibit of the Seminar

The field trips of the 1935 Seminar meetings were of unusual interest because of the various

parts of the state which were visited. Trips were made to Portland Parks, the Lambert Gardens and the Leach Gardens. The Leach Gardens, founded by Mr J Leach, a retail pharmacist of Portland, were of unusual interest because of the large collection of medicinal plants under cultivation. An extensive collection of trees and shrubs of the northwest were also viewed in this garden.

At Estacada the Seminar members made a tour of the Ginseng and Hydrastis farms. In this region about fifty farms are devoted to the cultivation of these plants on a commercial scale. Representatives of the Ginseng and Hydrastis Growers Association conducted the tour and discussed problems of cultivation and other details of interest.

Two days were devoted to an extensive field trip which carried the members from Portland to Corvallis and return. The trip was made by auto and it covered one of the most beautiful sections of Oregon. The flora of the coast region in the vicinity of Newport was studied as well as that further inland on the coast range. *Digitalis* was seen flourishing as a weed along the roadside and in fields for many miles west of Corvallis. At Corvallis Dean Zieffe conducted the members on a tour of inspection through the School of Pharmacy of Oregon State College and members of the School of Forestry conducted a tour over the campus of the College. One of the finest collections of Conifers in America was viewed and a number of buildings were inspected including the School of Forestry, the Museum, Student Memorial Building and the Herbarium. A short trip from Corvallis brought the members to the Peavy Arboretum where *Cascara* and many other interesting plants were seen under cultivation. On the return to Portland the Seminar members passed through the Willamette valley where Mint and Hop farms were inspected.

The closing business session of the Seminar was held at the Multnomah Hotel on Friday evening. F J Bacon, Western Reserve University, was elected *President* for 1935-1936. A W Matthews, University of Alberta, Edmonton, Canada, was elected *Vice President* and E H Wirth, University of Illinois, 701 So Wood St, Chicago, Ill., was elected *Secretary-Treasurer*. Professor Frank H Eby and Dean Wm B Day were appointed members of the Executive Committee. Resolutions were unanimously adopted expressing the thanks of the Seminar to A O Mickelsen and E T Stuhr for their cooperation in arranging details of the program which proved to be one of the most instructive and valuable in the history of the organization.

The following members and visitors were in attendance at the thirteenth annual meeting of the Plant Science Seminar: Charles F Mollett, Mrs C F Mollett, E N Gathercoal, Mrs E N Gathercoal, Frank H Eby, Mrs Frank H Eby, F Hobart Eby, F A Gilfillan, L C Britt, Wm B Day, Mrs W B Day, A Zieffe, Marin S Dunn, Mrs M S Dunn, J Nichols, Mrs J Nichols, John Seybert, Mrs J Seybert, E B Fischer, Mrs E B Fischer, A W Matthews, A O Mickelsen, Ernst T Stuhr, Mrs E T Stuhr, H V Arny, Mrs H V Arny and Mr McMurray.

Plans for the 1936 sessions will be announced at a later date.

COMMITTEE REPORTS*

REPORT OF THE COMMITTEE ON HORTICULTURAL NOMENCLATURE

Substantial progress has been made by this committee upon the list of names of drugs, spices and medicinal and dye plants which it is compiling for inclusion in the second edition of *Standardized Plant Names*. Your chairman has sent out copies of lists compiled from the U S P, N F and Part II of the U S D to Committeemen Gathercoal and Ballard for further checking and decision upon the names of items appearing in these works which are to be included in the Association List.

The list, when completed will contain a single name for every vegetable drug, spice or dye, a single botanical name for each plant yielding these and a single synonym for every item for which a common name has been employed.

Our next task will be that of studying the names on wholesalers' lists of drugs, spices and dyes and including such as are not represented in the present lists.

* For action, see Abstract of Minutes, House of Delegates, pages 911 and 912, October JOURNAL

Some expense will be entailed for postage and secretarial assistance during the completion of the work. Accordingly we recommend that an appropriation of \$20 00 be set aside for the use of this committee in completing the work on the ASSOCIATION List—(see October JOURNAL page 911)

(Signed) C W BALLARD, E N GATHERCOAL H W YOUNGKEN, *Chairman*

REPORT OF COMMITTEE ON WEIGHTS AND MEASURES *

Since the Committee on Weights and Measures began a survey to find out the accuracy of the scales weights and measures used in drug stores and reported their findings at our last meeting it appeared logical for the committee this year to continue along the same lines. The material previously collected was at the disposal of the committee and inquiries were again directed to the various state agencies, with special attention to those states not previously reporting to find out what supervision was exercised and the findings concerning the number of scales and weights examined, passed, adjusted and condemned wherever it was possible to obtain this information.

Six states, Colorado, Georgia, Idaho, Rhode Island, South Carolina, West Virginia gave no response to our efforts and there is nothing in the material previously collected to throw any light upon the situation that may exist in these states.

Twenty-four states exercise practically no supervision or control of pharmacists' scales and weights. Of this number, Arkansas, Florida, Louisiana, Mississippi, Missouri and Oklahoma have no departments of weights and measures and evidently there is no provision by law whereby any existing state agency may supervise, although in Oklahoma the University does somewhat. Alabama and Oregon have made provision for inspection and testing and will do so hereafter. In New Hampshire, North Carolina and Utah testing is done upon request or complaint only. In Maryland and Virginia the cities of Baltimore and Richmond exercise control. In New Mexico it is the duty of the local sheriffs to test scales. Illinois and Nevada report lack of personnel which satisfactory supervision requires and Minnesota has discontinued this work because of lack of funds. In Indiana, Kentucky, Montana, North Dakota, Ohio, Texas, Washington and Wyoming the departments of weights and measures are inactive without any reasons given.

Eighteen states and the District of Columbia report satisfactory supervision under existing laws by Boards of Health, Departments of Agriculture or Weights and Measures Departments but no separate record was kept or supplied for the testing of pharmacists' scales as a class in the states of Arizona, California, Connecticut, Delaware, Iowa, Kansas, Maine, New York, South Dakota, Tennessee, Vermont and Wisconsin. In Massachusetts, it is compulsory to have weighing and measuring equipment tested. Vermont laws provide specifications for two classes of drug scales and tolerances for each class. Massachusetts, Michigan, Nebraska, New Jersey, Pennsylvania and the District of Columbia supplied information concerning the number of scales and weights tested, number found correct, number adjusted and number condemned as follows:

Massachusetts—1790 scales approved, 78 condemned, 30,203 weights approved, 393 adjusted, 552 condemned.

Michigan—2516 scales approved, 44 condemned, 21,480 weights approved, 1138 condemned, 7623 graduates approved, 29 condemned.

Nebraska—667 scales approved, none condemned.

New Jersey—844 scales approved, 15 adjusted, 20 condemned, 20,475 weights approved, 1137 adjusted, 1862 condemned.

Pennsylvania—163 scales approved, 14 condemned, 279 weights approved, 22 adjusted, 21 condemned.

District of Columbia—350 scales approved, 48 adjusted, 16 condemned, 6940 weights approved, 92 condemned and confiscated.

Comments from these states indicate conditions are improving with regular inspection being done, but according to the present record 3 per cent of the scales examined were unfit and 1 per cent required adjusting, while $4\frac{1}{2}$ per cent of the weights were unfit and 2 per cent required adjusting. If this percentage of these important devices is inaccurate in states where constant supervision is exercised conditions generally as to pharmacists' scales and weights must be very bad especially in those thirty states that do not concern themselves about it.

* See October JOURNAL, page 911.

There is evidenced in the survey thus far an apparent lack of interest or failure to evaluate properly the importance of the pharmacists' weighing devices by the departments in some states which are charged with supervision over weights and measures. The testing of weights and measures in pharmacies should and could be best done by Boards of Pharmacy or Boards of Health, but it is eminently of first importance that it be done by any state agency rather than be left undone. It is suggested that the attention of the various Boards of Pharmacy be directed to the unhealthy situation which prevails and that more emphasis be placed upon the importance of standard equipment to insure accuracy in compounding and dispensing. The importance of and necessity for this is well established and it is desired that the proper state agencies be awakened to their responsibilities.

It is recommended that the incoming committee continue this survey work in order to show what progress is being made and to provide more facts and figures pertaining thereto. (Signed) R. P. FISCHER, W. MAC CHILDS, ROWLAND JONES, H. W. PARKER, CHAS. S. PIERCE, P. H. COSTELLO, *Chairman*

REPORT OF THE COMMITTEE ON WILLIAM PROCTER, JR., MEMORIAL FUND

The Committee on the William Procter, Jr., Memorial is pleased to report that the new model for the statue which will be placed in the foyer of the AMERICAN PHARMACEUTICAL ASSOCIATION Headquarters Building in Washington has been approved by a majority vote of its members.

To be more precise the recent canvass on the submitted photographs of this model shows ten unqualified votes for the acceptance of the sketch and one vote that suggested a minor change in the design, and as soon as the sculptor returns from vacation this will have our immediate attention, and the architect will be asked to give suggestions for the base of the statue.

Until now, the work of this Committee has been conducted without the expenditure of any funds that were collected for this memorial and while we regret the unavoidable delays that we have encountered, every member of your committee realizes that each delay will prove to be an advantage for the completed work.

The Committee hopes to make arrangements for the early casting of the statue and believes that its emplacement will be an addition to the Headquarters Building and a graceful tribute to 'The Father of American Pharmacy'—See October JOURNAL page 911.

(Signed) JAMES E. HANCOCK, *Chairman*

REPORT NATIONAL PHARMACY WEEK EXECUTIVE COMMITTEE *

The eleventh annual observance of the National Pharmacy Week movement will be held during the week of October 21st. The date has been changed from that of former years so as to permit Colleges of Pharmacy greater opportunity to participate in the activities of Pharmacy Week. During the course of the past years many Colleges of Pharmacy have conducted 'Open House' during Pharmacy Week, thus permitting the students from other departments, the Faculty and members of the laity an opportunity of noting through the agency of demonstrations and lectures, the many advances that are being made in American Pharmacy.

This is a splendid manner in which to tell the story of Pharmacy, for at the present time our Colleges are well equipped and have many things of interest to set forth by means of demonstrations. From conversations with those who have assisted in the "Open House" events it is quite evident that the laity have but a slight appreciation of the fine work being accomplished by our Colleges of Pharmacy.

The Colleges of Pharmacy that maintain medicinal plant gardens are fortunate in that many specimens of medicinal plants can be shown on these occasions through the agency of one or more types of professional displays.

It is hoped that our Colleges of Pharmacy will cooperate to the fullest possible extent during the eleventh annual observance of Pharmacy Week. Members of the Faculty should arrange at once for the presentation of talks before various community organizations as well as for radio talks. A number of Colleges of Pharmacy have likewise been of material assistance to retail pharmacists relative to suggestions and materials for professional window displays. Certain Colleges of Pharmacy have arranged for truly worth while professional Pharmacy displays in the

* See page 911, October JOURNAL. See also page 257, April JOURNAL.

city library as well as in windows of leading stores in the town. Here is an excellent medium for a College of Pharmacy to tell its story to the residents of the community. The National Pharmacy Week Executive Committee urges the Deans and their Associates, as well as the members of the student body, to take an active and leading interest in the work of the National Pharmacy Week movement. When supported by educational institutions, the movement takes on a deeper significance than a movement in which they are not duly represented.

National Pharmacy Week Window Display Contest—As in former years there will be conducted another National Pharmacy Week Window Display Contest. The judges for this contest will be appointed by the National Pharmacy Week Executive Committee from the City of Cincinnati, the city in which the 1935 Convention of the National Association of Retail Druggists will be held. The judges will be appointed from a list of leading personages in the Drug Trade Industry of that city and will include a representation of the scholastic world, manufacturers, wholesalers, editorial field and of course retail pharmacists.

Robert J. Ruth Memorial Trophy—Secretary Lee Williamson, of the Federal Wholesale Druggists' Association has informed the chairman of the National Pharmacy Week Executive Committee that his association will again donate a beautiful silver loving cup which has been designated as the Robert J. Ruth Memorial Trophy, thus honoring the founder of the Pharmacy Week movement.

To date this beautiful trophy has been awarded to the following for the best professional window display in the years as designated:

1931 Haussman Pharmacy Philadelphia, Pa

1932, John O'Brien Drug Company, Omaha, Nebraska

1933, Sisson Drugs, Inc. Chicago, Ill

1934, Apothecaries Hall, New Haven, Conn

Kindly bear in mind that this beautiful trophy becomes the permanent possession of the winner each year. There seems to be some misunderstanding on this point, notwithstanding that the pharmaceutical press has made frequent mention of same.

State and Local Prizes—In addition to the Grand Prize, numerous prizes are likewise offered by state and local organizations, which in the majority of cases likewise become the permanent possession of the winner.

Honorable Mention Certificates—Ten honorable mention certificates will be awarded jointly by the AMERICAN PHARMACEUTICAL ASSOCIATION and the National Association of Retail Druggists for the next best ten professional window displays in the National Pharmacy Week Window Display Contest, thus affording a greater number an opportunity to share in the national awards.

Pharmacy Week Maps—The National Wholesale Druggists' Association has a number of the medicinal plant maps of the United States as well as maps featuring the work of our Colleges of Pharmacy on hand. These are prepared under the direction of Dr. E. L. Newcomb and associates and should find ready acceptance on the part of retail pharmacists for professional window displays as well as for gifts to be presented to local educational institutions. Departments of Biology, Botany and other departments of educational institutions will gladly welcome receiving a copy of these maps. Retail pharmacists are urged to place an order for these maps through their service wholesaler. Many retail pharmacists have presented copies of them to educational institutions and the reaction has been most favorable.

The Pharmaceutical Press—The pharmaceutical press has given the National Pharmacy Week movement splendid support to date. A number of these journals edit special Pharmacy Week numbers that are a real credit to the profession of Pharmacy. It is hoped that this splendid support will be continued in the future and that we may be privileged to receive 1935 special Pharmacy Week editions of these journals.

Editors of pharmaceutical journals are always face to face with the problem of securing worth while articles for publication. The National Pharmacy Week Executive Committee urges all those who are in a position to write interesting articles to cooperate with the pharmaceutical press to the fullest possible extent.

Perhaps you are acquainted with some interesting phase of Pharmacy that as yet has not appeared in print. It would be a splendid thing if you would pause in the rush of your busy lives to express these things in writing, and then submit them to the pharmaceutical press. To date

there has appeared a résumé of Famous Discoveries by Famous Pharmacists This list is far from complete If you are in possession of additional facts, will you make it a point to send same to the pharmaceutical press or to the chairman of the National Pharmacy Week Executive Committee?

Pharmacy Week Bulletins—Owing to the fact that the chairman of the National Pharmacy Week Executive Committee was confined to his home for a period of two months this summer on account of illness, there has been a delay in sending out the first of a series of *Pharmacy Week Bulletins* to the pharmaceutical press, to members of the Committee as well as to cooperating groups Two bulletins have just been completed and should be in the mail before August 1st The first bulletin deals with a general report while the second deals with the subject of professional window displays Many suggested titles for professional window displays have been set forth in the second bulletin Additional bulletins will be prepared during the course of the next month or so and which will receive wide distribution

Finances—The present fund as made possible through the AMERICAN PHARMACEUTICAL ASSOCIATION and the National Association of Retail Druggists amounting to \$250 00 per year per association is far from a satisfactory amount Many persons in the Drug Trade Industry may wonder at times why the National Pharmacy Week Executive Committee does not prepare additional materials for distribution than have gone forward in the past When one takes into consideration the cost of mimeographing, printing and mailing, the sum of \$500 00 is soon expended The National Pharmacy Week Executive Committee expended \$498 00 during the past year and owing to lack of money was unable to comply with nearly 500 additional requests for Pharmacy Week stories

The condition is somewhat more troublesome in light of the fact that the chairman of the National Pharmacy Week Executive Committee failed to receive one donation of \$250 00 It has been necessary to curtail expenses along the line to make up this deficit as well as to make up the deficit that the chairman encountered when first assuming the office

The National Pharmacy Week Executive Committee recommends that some plan be worked out whereby the Committee will have at least \$1000 00 per year for the work of the National Pharmacy Week movement

Additional Support Needed—During the course of the past few years the National Pharmacy Week Executive Committee has mailed out thousands of copies of human-interest appeal stories to those requesting same Last year some 20 different stories were prepared in mimeograph form and which were greatly appreciated as evidenced by the extra demands for same as well as comments as received from those who made use of them Hundreds of retail pharmacists utilized these stories for presentation before various community organizations Pharmaceutical educators have embodied a considerable portion of these talks in their lectures during the course of the year

The Chairman of the National Pharmacy Week Executive Committee has personally prepared a number of these stories for distribution Requests for additional stories have gone forth to the pharmaceutical educators and others associated with the Profession of Pharmacy, but the support received was far less than had been anticipated During the course of one year but one educator a Dean of one of our Colleges of Pharmacy, responded

No doubt pharmaceutical educators have on hand copies of talks they have presented to various community groups as well as having copies of radio talks on hand The National Pharmacy Week Executive Committee gladly welcomes material of this kind and trusts that greater support will be forthcoming in the future

Value of National Pharmacy Week—It is quite evident that the National Pharmacy Week movement represents an innovation that should be continued in the future It has been a means of bringing the message of Pharmacy to the public as well as a means of encouraging retail pharmacists and others to greater professional activities, such as perhaps has not been accomplished by any other movement in the history of Pharmacy It is quite evident that a movement of this kind is essential to the development of the profession of Pharmacy The National Pharmacy Week movement has been kept within professional bounds and many suggestions have been studied and finally vetoed, so that the movement would not become commercialized

Future Developments—During the course of the past four years the Chairman of the National Pharmacy Week Committee has consulted many individuals of the Drug Trade Industry concerning the future development of the movement Several suggested plans have been worked

out but have not been put into effect, due to the lack of finances. It is quite evident that certain changes should be made in the movement, for it has continued over a period of ten years more or less on the original setup.

The next decade should witness many interesting developments, for there is much that can be accomplished provided funds are made available to carry on this work. No attempt will be made in this report to outline the suggested activities. The National Pharmacy Week Executive Committee will await such a time when a larger annual fund has been made available, before attempting to reshape the structure of the movement.

The response to the movement on the part of retail pharmacists in connection with professional window displays during the past year was most encouraging. In fact, reports indicate that a greater activity took place last year than in a few years previous. This would appear to be indicative of the fact that pharmacists are awakening to the potential possibilities in the professional field and are giving concrete expression to these thoughts on their part by developing interesting professional window displays.

REPORT OF THE COMMITTEE ON TRANSPORTATION

Portland, Oregon
August 7, 1935

The work of the Committee on Transportation has been easier during the past year than it has been in some years because the summer tourist rates to Portland are lower than the convention rates from most sections of the country, and it was not necessary or feasible to use the certificate plan for the meeting.

The work of the Committee on Transportation, however, includes a great deal of correspondence with the railroads and the chairman must give considerable time to interviews with representatives of the various roads. It has been our policy to secure information about the available routes and rates to the Convention City and to distribute this information to the members, leaving each member free to choose the route which suits him best. Acting on this policy, studies were made of the many possible routes to Portland from different parts of the country, and summaries of the results of this study were published in notices appearing in three numbers of the JOURNAL, also many circulars giving information about routes were sent to two members by the local committee and by various transportation systems.

An efficient Committee on Transportation is an essential part of an organization like ours and the members of the present committee have tried to do their part to help insure the success of the meeting (see page 912 October JOURNAL).

(Signed) T. J. BRADLEY, *Chairman*

LEASE OF "DRY ICE" WELL

Harold L. Ickes, Secretary of the Interior, has signed the first lease in American history for the operation of a "dry ice" well. The well produces almost pure carbon dioxide and is located in Carbon County, Utah. The well was first drilled in January 1924 showing a gas content under terrific pressure of more than 98 per cent pure carbon dioxide. At that time there was no known means of utilizing the gas except locally, so that the well was plugged and temporarily abandoned.

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and Branches shall become the property of the Association with the understanding that they are not to be published in any other publication prior to their publication in those of the Association, except with the consent of the Council"

—Part of Chapter VI, Article VI of the By-Laws

ARTICLE III of Chapter VII reads "The objects and aims of local branches of this Association shall be the same as set forth in ARTICLE I of the Constitution of this body, *and the acts of local branches shall in no way commit or bind this Association, and can only serve as recommendations to it* And no local branch shall enact any article of Constitution or By Law to conflict with the Constitution or By-Laws of this Association"

ARTICLE IV of Chapter VII reads "Each local branch having not less than 50 dues paid members of the Association holding not less than six meetings annually with an attendance of not less than 9 members at each meeting, and the proceedings of which shall have been submitted to the JOURNAL for publication, may elect one representative to the House of Delegates"

Reports of the meeting of the Local Branches shall be mailed to the Editor on the day following the meeting, if possible Minutes should be typewritten with wide spaces between the lines Care should be taken to give proper names correctly and manuscript should be signed by the reporter *Please advise us of changes in Roster and mail reports promptly*

BALTIMORE

The October meeting of the Baltimore Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held at the Hotel Emerson on Thursday, October 31 President Reindollar was in the Chair

The minutes of the last meeting, held in April 1935, were called for and read by the Secretary President Reindollar then introduced Secretary E F Kelly, of the AMERICAN PHARMACEUTICAL ASSOCIATION, who, representing the chairman of the Scientific Section was to present the Ebert Prize for 1935 to Marvin J Andrews of the School of Pharmacy of the University of Maryland Dr Kelly mentioned the foundation of the award from the legacy of the late Dr Albert Ebert, how the first award had been made in 1874 and that thirty-nine awards had been made since that date He elaborated on the work of the recipient in regard to the margin of permissible error in prescriptions and the importance of studies of this type Dr Kelly expressed the best wishes of Dr Fischelis to the Baltimore Branch members and to Mr Andrews The presentation of the medal followed

President Reindollar introduced the speaker of the evening, Dr David M R Culbreth, Emeritus Professor of Materia Medica of the School of Pharmacy, University of Maryland Dr Culbreth, it was pointed out, has been a member of the AMERICAN PHARMACEUTICAL ASSOCIATION for a half century and present at the meeting were four generations of pharmacists Dr Culbreth selected for his topic, "How can a person be satisfied and contented while making a living and a reserve for old age in the retail Drug Business?"

The speaker delivered a scholarly address concerning his early experiences in the retail drug business, and how in his experience the young pharmacist of to day should plan his life's work Dr Culbreth mentioned the value of a thorough pharmaceutical training both theoretical and practical, and how the health of the individual should be carefully guarded as should his savings

President Reindollar said it was a rare pleasure to hear the experiences of this master pharmacist and the Baltimore Branch took great pride in counting him a member A rising vote of thanks was tendered Dr Culbreth About twenty-five attended the meeting

C JELLEFF CARR, *Secretary-Treasurer*

CHICAGO

The first meeting of the Chicago Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held Tuesday evening, October 22nd at the University of Illinois College of Pharmacy The meeting was called to order by President Morrison

The first speaker of the evening was Lawrence Templeton who told of "The A P H A Convention in Portland, Oregon, and of Pharmacy, Cascara and Salmon in Oregon"

He told of many happenings at the convention of other than a scientific nature and referred the assembly to the August issue of the JOURNAL for the scientific and business matters transacted at the convention

Mr Templeton spoke as one making his first attendance at a national convention of the ASSOCIATION and made a very flattering report of the value of attending these yearly meetings, and urged more of the members of the Chicago Branch to arrange their summer vacations so that they could attend the next meeting in Dallas, Texas

A very interesting discussion was given of the retail drug conditions on the Pacific Coast and of a visit to the first and largest Cascara Farm on the coast, which is located near Browns ville, Oregon Mr Templeton, a native Oregonian, gave a story of the habits of the salmon during their trek up the fresh-water streams to their spawning grounds

Pictures, pamphlets, newspaper items cascara berries and other miscellaneous items were passed around to enliven the discussion

The second speaker of the evening, Mr Shkolnik, spoke of "Current Topics at the N A R D Convention in Cincinnati" He first told of the social happenings at the convention and led us to believe that the Chicago delegation was well taken care of in that respect

A report was given of activities on Fair Trade bills Figures were presented to show the comparative sales profits and wages paid between the chain stores and the independent stores during the past few years The report was all in favor of the chain store having the advantage and constantly gaining a greater advantage

The speaker presented his own ideas in regard to the Fair Trade bills and looked upon it as an injustice to the public to pass bills restraining price competition His view of the matter was to pass legislation that would stop unfair price discrimination between the small retailer and the large organization True a car-load of merchandise should be purchased for less per unit but no less than the difference between the cost of handling the units in car load lots and one twelfth of a dozen or one quarter of a dozen With this system in practice Mr Shkolnik averred that we would not need laws restraining price cutting below cost as the price of an item on the retailer's shelf would be the same to all and that very few retailers, large or small, would continue to sell at cost or at a sale price that is in many cases below the wholesale price of the independent retailer

The numerous questions propounded by the large gathering testified as to their interest in the discussions of the evening

L TEMPLETON, *Secretary Treasurer*

NEW YORK

The October meeting of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held October 14th, in the College of Pharmacy, Columbia University About seventy members and their guests attended

The meeting was called to order by President Charles W Ballard The secretary read his report, which was approved

Treasurer Currens read his report, it was accepted

Chairman Lehman, of the Committee on Education and Legislation, submitted the following report

National Legislation—Congress having adjourned, without enacting the two bills of great interest to pharmacy namely the Copeland Pure Food and Drug Law, (S 5) and the Patman Bill (H R 8442) those favoring the enactment or the rejection of these two measures are continuing their agitation for or against the same In the matter of the Patman Bill, which provides for equal treatment for all distributors, great or small much activity is shown in independent retail circles All discounts and allowances in any quantity, are to be the same for the small purchaser, as well as the large one

Congressional investigation of this measure has created quite a sensation for it has shown that some of the great distributors had received special discounts, bonuses and advertising allowances from many of the manufacturers of nationally advertised merchandise This bill is endorsed by the Federal Wholesale Druggists' Association and the National Association of Retail Druggists

Demands for a national law against unfair competition are being voiced by associations of retail merchants all over the country, and an attempt to enact a Fair Trade Law similar to the

Capper Kelly Bill, so long before Congress, or the various State fair trade laws that have been passed during the year, will be pushed vigorously during the coming session of Congress

Toilet preparations are subject to a 10% Federal tax they include non official lotions such as Rose-Water and Glycerine, and returns to the Collector of Internal Revenue must be made if the pharmacist mixes the same for his customer Hair-fixing lotions are among the taxable items (also known as wave setters)

Retail pharmacists must see that their stock of liquors, alcohol and tincture of Jamaica Ginger are in stamped containers, even though the preparations are used only in compounding prescriptions violations of this rule may subject them to penalties

In regard to State Fair Trade Laws The Superior Court of California recently held that the California Fair Trade Law does not violate the Sherman Act Decision rendered in the case of the Emerson Drug Co vs Weinstein Co In New York State many manufacturers of nationally advertised drug items have submitted contracts that have been approved by the New York State Pharmaceutical Association's Fair Trade Committee about thirty-five in all However, many of the larger concerns have failed to do so, and much impatience and concern has been prevalent in various sections of the state A number of mass meetings have been called, especially in Buffalo, Rochester, Syracuse and Brooklyn, to protest against the delay in offering contracts and in consequence, several more were issued A mass meeting in New York City, including the Metropolitan District was held on October 28th

A meeting of retailers with manufacturers was held on October 7th, under the auspices of the Board of Directors of the New York Pharmaceutical Council and the presidents of the various constituent associations

Any pharmacist who manufactures his own private formula or has manufactured for him, medicinal or cosmetic preparations, may have to pay \$25 00 for the registration of each one for the first year and \$10 00 every year thereafter if the New York Board of Health adopts the proposed amendment to the Sanitary Code Also disclosure of formulas, registration of labels advertising matter and submitting of samples are contemplated under the amendment the matter is in the hands of the Legislative Committee of the New York Pharmaceutical Council a meeting was held with the Health Commissioner, and a hearing has been set for December 2, 1935

Auditor Bilhuber reported that the accounts had been checked and everything had been found in perfect order

Delegate Hugo Schaefer, to the House of Delegates for the New York Branch, submitted a report on impressions gathered at the ASSOCIATION convention held at Portland

He reported that the meeting had been very well attended and that it was a very successful meeting He discussed the resolutions which had been presented by President R P Fischelis of the ASSOCIATION and pointed out that the Committee on Resolutions had acted liberally Many of the proposals made by President Fischelis were passed and it was plain that the majority of the delegates were in sympathy with his suggestions The resolution introduced by the New York Branch, relative to providing a rebate from the AMERICAN PHARMACEUTICAL ASSOCIATION to each branch for every ASSOCIATION member within its district was referred to the Council since it involved fiscal matters The feeling was prevalent that the proposal was well received and would in all probability be acted upon favorably

The Copeland S 5 Bill was approved by the ASSOCIATION

P H Costello was installed as the president of the ASSOCIATION

Dr Schaefer also reported that the other groups meeting at the time of the A P H A convention enjoyed a good attendance and that the scientific part of the convention had yielded a very large number of papers

Samuel C Henry, New York Branch delegate to the New York Pharmaceutical Council, reported that he had attended all meetings both regular and special since his appointment and he thanked the Branch for this opportunity to serve He explained that the Council was doing good work in dealing with the problems of the retailer The new Fair Trade Code had been widely and thoroughly discussed and some anxiety existed over the failure of manufacturers to submit contracts and failure of retail druggists to sign approved contracts A similar kind of law is now operating in nine states of the union Mr Henry urged retailers to lose no time in signing approved contracts He also reported that wholesalers had been asked by retailers to cooperate in eliminating the number of new drug stores It was felt that a new store should not be opened

until a real need for the service existed. He called attention to the special meeting to be held on October 28th, in order to arouse interest of the retailers in signing approved Fair Trade contracts. Another point discussed at Council meetings was the lack of funds available to officials for the enforcement of the State Narcotic Law.

President Ballard thanked Mr. Henry for his report and called upon Chairman Steiger of the Progress of Pharmacy Committee, who submitted the following report:

The most important items in regard to the progress of pharmacy are, of course, those in the report of our delegate to the Portland meeting.

Our "Pharmaceutical Abstracts" cannot be omitted in any discussion of the progress of pharmacy. In a few short months these abstracts have assumed an important place in the literature of scientific pharmacy. It has become difficult for your committee to make their report without duplicating the work of the abstracters.

An interesting article on odors and the sense of smell appears in the October *Industrial and Engineering Chemistry* ("Seeking a Working Language for Odors and Flavors," E. C. Crocker). Of this article the editors say, "Odors can be detected in lower concentrations by the nose than any other characteristic by almost any other instrument," according to Crocker; yet, because no satisfactory method of description and record of the sensations of smell exist, the value of this extremely sensitive instrument is practically neglected. Pleading for the better development of our language descriptive of odor characteristics, Crocker reviews what has been done in this field and emphasizes the value of further work in classifying and evaluating odors.

Drug Topics for September 16th, reports that Parke, Davis & Co. have patented a procedure for manufacturing an effective toxin, an antitoxin and a toxin-antitoxin from meningococcus germs. Merck have patented an improved method of manufacturing and isolating salts of the aliphatic acid esters of choline. Purdue Research Foundation has been assigned the patent of a process for removing impurities from virus preparations by adjustment of hydrogen ion concentration and subsequent flocculation. Metal capsules containing volatile medicaments suitable for inhalation have been patented. The capsule is made of a low-melting alloy having a melting point below that of boiling water. When the capsule is dropped into hot water it will melt and release the inhalant composition. An Ontario physician is said to have produced products which he terms "Ensols," one of which had arrested the development of Carcinoma. These "Ensols" are produced, he said, by growing harmless proteolytic organisms on protein media which are thereby liquefied. In the liquid produced, he claims, is an active substance which can be separated and sterilized. This has the power of liquefying proteins similar to the base, but has no effect upon the other types of proteins. An ensol produced from a carcinoma base has a specific action on carcinoma tissues. Dr. Connell says:

In their September 30th issue, *Drug Trade News* reports a Squibb patent for the use of a glycol in making pure divinyl ether. Dr. Ruzicka announces that he has synthesized Testosterone from cholesterol. (Androsterone had already been synthesized from cholesterol)—Parke, Davis & Co. have been assigned a patent for producing a pituitary diuretic preparation.

In an article entitled "Nutrition and Vitality" in Parke, Davis & Co.'s "Therapeutic Notes" for September, the statement is made that "One cannot read any number of the important medical journals without being impressed by the increasing importance which is attached to the subject of vitamins. These elusive substances which may be accidentally included in or similarly omitted from one's diet and which are so essential to health in many ways are now the subject of study by a large and growing number of students. At first suspected of being a fad, the study of vitamins now engages the attention not only of dietitians and clinicians, but of biological research workers and chemists."

Under the heading of unfinished business, Dr. Schaeger presented a letter from the office of the Controller of the City of New York. After some discussion, Dr. Bilhuber moved that the letter be filed. This was seconded by Mr. Currens and no further action was taken.

A communication from Robert S. Lehman, signed for the New York State Pharmaceutical Association, was read. This called upon our president to appoint one delegate to be a member of the Committee on Resolutions of the State Association, for its annual convention. The president said that he would announce the appointment at the next meeting.

President Ballard called attention to the arrangements which had been made for the Remington Medal presentation in Washington and opened the whole matter for discussion. In the

discussion, Messrs Schaefer, Bilhuber, Army, Rudolf Hauck and Ballard took part. Following the discussion, it was agreed that further arrangements of the details of the Remington Medal presentation be left to the president and the secretary.

Under the heading of new business, Mr Currens submitted the Branch membership applications of Mr Stern and Dr Snyder, together with their remittances. Both gentlemen were elected to Branch membership. Dr Schaefer submitted the application of Alfred Biamonte for ASSOCIATION membership and directed the secretary to forward this to Washington.

Dr Schaefer then moved that the Branch mail cards to its members urging the election of Dr Fischelis as a member of the Council and Dr Lascoff as vice president. This motion was seconded and approved.

A member of the Branch arose and discussed the resolutions proposed for the amendment of the Sanitary Code of the City of New York which would require registration of all proprietary remedies and would require every manufacturer to pay a fee of \$25.00 for the registration of each item in the City of New York. At the close of his discussion, he moved that the Branch go on record as being opposed to this resolution. The motion was seconded and brought up for discussion.

Dr Wimmer pointed out that the Branch is a member of the National Pharmaceutical Council and that the purpose of the Council is to represent the united opinion of pharmaceutical organizations in New York City, and that since the Council had already taken steps to combat this new regulation it would be wholly unnecessary and out of place for the Branch to act independently. Dr Schaefer called attention to essentially the same point that Dr Wimmer had emphasized. The motion was then withdrawn with the consent of the member who had seconded it. This brought to a close the business part of the meeting.

President Ballard then announced that the topic for the evening was the "Manufacture of Glass." V. F. Hammel, of Whitall, Tatum Co. who had been regularly scheduled to address the Branch unfortunately could not attend and that Mr Petid had come in his place, he was then introduced by the president. The speaker's remarks were very brief, his principal presentation being a moving picture film which very thoroughly showed the manufacture of glass and glass products. At the close of the meeting a rising vote of thanks was accorded the speaker and the meeting was adjourned.

RUDOLF O. HAUCK, *Secretary*

REPORT OF SPECIAL MEETING OF THE NEW YORK BRANCH OF THE AMERICAN
PHARMACEUTICAL ASSOCIATION HELD ON THE OCCASION OF THE PRESENTATION OF THE
REMINGTON MEDAL TO DR. SAMUEL LEWIS HILTON

The Remington Medal for 1935 was presented to Dr. Samuel L. Hilton at a dinner held in his honor at the Mayflower Hotel, Washington, D. C. on the evening of October 19, 1935.

The dinner was sponsored by the District of Columbia Pharmaceutical Association, the District of Columbia Board of Pharmacy, the District of Columbia Veteran Druggists Association, the faculty of the George Washington School of Pharmacy and the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION.

Dr. Augustus C. Taylor of Washington was chairman of the Committee on Arrangement. The toastmaster for the evening was Dr. Robert L. Swann and speakers at the dinner included, Dr. Harry A. Fowler of Washington, Prof. E. Fullerton Cook of Philadelphia, Dean T. J. Bradley of Boston, and Secretary E. F. Kelly of Washington.

When the time came for the presentation of the medal, the toastmaster introduced President Charles W. Ballard of the New York Branch who called the meeting to order. A quorum for the New York Branch was assured by the presence of more than a sufficient number of New York Branch members. After some brief introductory remarks he requested Past-President H. V. Army of the New York Branch to present the medal. In presenting the medal, Dr. Army stated how pleased the New York Branch was with the fact that so well deserving a person had been awarded the medal and extended the congratulation of the New York Branch to the recipient, who responded.

RUDOLF O. HAUCK, *Secretary*

NORTHERN NEW JERSEY

The first Fall meeting of the Northern New Jersey Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held at the Rutgers University College of Pharmacy on October 21st with President George C Schicks presiding. More than fifty members and guests attended the meeting.

Dean Ernest Little, *Chairman* of the Membership Committee outlined his suggested approach to the problem of increasing membership in the ASSOCIATION as described in the JOURNAL for September and his plan was enthusiastically received by the Branch. After several members discussed various features of Dr Little's suggestions, the Branch voted unanimously to endorse the plan, to adopt as one of its major projects for the year the doubling of its membership by August 1 1936 and to appropriate sufficient money to present a pennant each year for the next two years to the Branch showing the highest percentage gain in membership during the year.

Chairman John Silsby of the Committee on Practice of Pharmacy discussed developments of the last few months in the profession and Robert W Rodman delegate to the AMERICAN PHARMACEUTICAL ASSOCIATION Convention reported briefly on the Portland meeting.

Chairman Anton Hogstad Jr of the Executive Committee of National Pharmacy Week, delivered an excellent address on the subject of "Professional Pharmacy." Dr Hogstad illustrated his remarks with a series of lantern slides showing outstanding examples of impressive prescription pharmacies and attractive professional window displays.

Dr Robert Lee Swain of Baltimore former president of the AMERICAN PHARMACEUTICAL ASSOCIATION and present chairman of the Committee on Fair Trade Laws for the National Association of Retail Druggists will address the meeting of the Northern New Jersey Branch to be held on Monday night November 18th.

C L Cox *Secretary*

NORTHERN OHIO

The regular monthly meeting of the Northern Ohio Branch AMERICAN PHARMACEUTICAL ASSOCIATION, was held at The Faculty Club, Western Reserve University Cleveland, November 8 1935. This was a dinner meeting and Dr E E Ecker Associate Professor of Immunology of Western Reserve University School of Medicine was the guest speaker.

Dr Ecker delivered a very interesting talk on the relative values of several well-known antiseptics. Considerable new experimental data relating to phenylmercuric nitrate was discussed and charts were presented showing its superiority as a bactericide and fungicide when employed in very high dilution. In cases of tinea and yeast infections of the skin phenylmercuric nitrate in ointment or lotion form was claimed to be highly efficacious. Further research is being done on this drug which Dr Ecker believes will have far reaching influence in changing current professional opinion of some of our widely used antiseptics.

N T CHAMBERLIN, *Secretary*

PHILADELPHIA

The November meeting of the Philadelphia Branch AMERICAN PHARMACEUTICAL ASSOCIATION was held in the Museum of the Philadelphia College of Pharmacy and Science Tuesday night November 12th, E H MacLaughlin presiding.

The minutes of the October meeting were read and approved.

President MacLaughlin read a communication from the Philadelphia Chamber of Commerce suggesting that the Philadelphia Branch make a bid for the 1937 meeting of the A Ph A. Ambrose Hunsherger made a motion that the officers of the Branch notify the Committee on Time and Place of the A Ph A that the Philadelphia Branch has gone on record as favoring Philadelphia for the 1937 meeting. Motion seconded and carried.

A letter from Dean Little of Rutgers University concerning a drive for new members for the parent body in 1936 was read. Mr Campbell made a motion that Dean Little's proposal of every member get a member in 1936 be given the endorsement of the Philadelphia Branch and that the President appoint a committee of five to help carry out the drive. Motion seconded and so ordered.

Our guest speaker, Secretary E. F. Kelly of the A. P. H. A., was introduced. He spoke on Pharmaceutical Progress. He referred to the progress made in Pharmacy, as a profession, during the past 15 years, giving due credit to the work of local and state pharmacists for their cooperation. He evaluated Pharmacy for its progress in Education, Legislative Control and Recognition of Professional Standing. He spoke of its recognition by the Federal Government and praised the standards set by Pharmacy.

Statistics were given to show that Pharmacy, as a profession, was not overcrowded, rather there seems to be an uneven distribution of schools and pharmacists.

The speaker's address was one of the most interesting heard by the Local Branch and it looks forward to hearing from Dr. Kelly again. A rising vote of thanks was given him.

GEORGE E. BYERS, *Secretary*

NATIONAL PHARMACY WEEK WINDOW DISPLAY CONTEST COMMITTEE

The following have been appointed to serve on the 1935 National Pharmacy Week Window Display Contest Committee:

Charles F. Henke, Jr., *Chairman*, Registrar, Cincinnati College of Pharmacy, Cincinnati, Ohio; O. C. Reifschneider, president, Ohio Valley Druggists' Association, Cincinnati, Ohio; Bernard J. Kotte, Otto E. Kissner, J. Otto Kohl, retail pharmacists of Cincinnati, Ohio.

This committee will select the winner of the 1935 National Pharmacy Week Window Display Contest from the photographs submitted by the secretaries of the various state pharmaceutical organizations. In addition to the winner, who will be awarded the Federal Wholesale Druggists' Association Robert J. Ruth Memorial Trophy, this committee will select the ten next best photographs which will be awarded merit certificates jointly by the AMERICAN PHARMACEUTICAL ASSOCIATION and the National Association of Retail Druggists.

Professor Henke, chairman of the National Pharmacy Week Contest Committee, will report the results of the contest to the chairman of the National Pharmacy Week Executive Committee, who, in turn, will release a bulletin announcing the winners of the 1935 National Pharmacy Week Window Display Contest.

For National Pharmacy Week Executive Committee, see report in this issue, pages 1023-1026.

SECOND EDITION OF PROFESSIONAL PHARMACY

The first edition of "Professional Pharmacy" has been exhausted and the favorable reception has prompted a revision which has been published. This present edition, which constitutes the first revision, has been prepared in a form particularly suitable for pharmacy schools, in anticipation of a larger use of the publication in the class room. Mr. Delgado has devoted time and study to the revision during the past year and as a result the forthcoming publication contains considerable additional matter. An Appendix includes many questions based upon the text that will aid the instructor and be helpful to the students in gaining an understanding of the problems which develop in pharmaceutical practice and the present conditions surrounding it.

An extended service to retail pharmacists has been kept in mind, therefore, in addition to the questionnaire referred to, the author has added a chapter on prescription pricing schedules and the open view prescription department has been discussed. There is included a list of 253 Manufacturers' Pharmaceutical Specialties, a list of 234 Galenicals, occurring five times or more in each 10,000 prescriptions and other lists give further detailed information on other items, their use, containers and unit price. About twenty-five more pages have been added but it has been possible to continue the price of 25 cents per copy. The publication may be obtained from the AMERICAN PHARMACEUTICAL ASSOCIATION.

ASSOCIATION BUSINESS

AD INTERIM BUSINESS OF THE COUNCIL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION 1935-1936

Office of the Secretary, 2215 Constitution Ave Washington, D C

LETTER NO 6

October 22, 1935

To the Members of the Council

32 *Fixing Date when N F VI Will Become Official* It is expected that N F VI will be issued by December 1 1935 and it therefore becomes necessary to set the date when the Sixth Edition will become official and replace the Fifth Edition

The Board of Trustees of the U S P Convention has set June 1, 1936, as the date when the U S P XI will become official, and it is advisable that both books become official on the same date as they will be issued at about the same time

On page 309 of the April 1926, issue of the A P H A JOURNAL, Item 68 and on page 404 of the May 1926, issue, of the JOURNAL, Item 74, a record will be found of the action taken by the Council fixing the date when the N F V became official

(*Motion No 6*) *It is moved by Du Mez that the National Formulary, Sixth Edition, shall be deemed to become official and to supersede and replace the National Formulary, Fifth Edition on June 1, 1936 and that the Mack Printing Company be authorized and directed to print upon the title page of the National Formulary, Sixth Edition the words 'Official from June 1, 1936' A vote on this motion is called for at this time If there is objection or any member desires to submit comment, the vote will be considered as tentative*

33 *Copy for the Official Coupon for N F VI* The first printing of N F VI will consist of 25 000 copies and it becomes necessary to order this number of official coupons which the ASSOCIATION is required to furnish

Heretofore, it has been customary to indicate each printing as a series and to identify each series by a letter, beginning with A and to number each coupon consecutively beginning with 1 The use of the serial letter has led to some misunderstanding that later series were revisions and each printing can be identified by the numbers

In the case of the coupons for the U S P XI it has been decided to omit the serial letter and to continue numbering the coupons consecutively beginning with 100,001 so that the coupon numbers for U S P XI cannot be confused with those for U S P X, which are below 100 000 It is proposed to carry out the same arrangement for N F VI

The coupon for N F VI will be of the same size as that for N F V and printed in the same colors—black and tan The same background cut will be used with the following wording printed thereon

National Formulary

Sixth Edition

Official Copy

Copyright 1935 by the

AMERICAN PHARMACEUTICAL ASSOCIATION

100,001

(*Motion No 7*) *It is moved by Du Mez that a serial letter be omitted from the official coupons for N F VI, that the coupons be numbered consecutively beginning with 100 001 and that the wording given above be approved for use on the coupons A vote on this motion is called for at this time If there is objection or any member desires to submit comment the vote will be considered as tentative.*

34 *Use of the Text of the National Formulary VI* An application for permission to use portions of the text of the National Formulary in the forthcoming revision of General Technique of Medication has been received from Dr Bernard Fantus of Chicago Illinois The request

was referred to Chairman DuMez of the Committee on Publications who submits the following motion

(Motion No 8) It is moved by DuMez that permission to use portions of the text of the National Formulary in the forthcoming revision of "General Technic of Medication" be granted to Dr Bernard Fantus, and that the customary charge of \$5 00 be waived because of the small amount of material quoted and the manner in which it is to be used, with the understanding that the publication will not be issued until the N F VI appears

35 Applicants for Membership The following applications properly endorsed and accompanied by the first year's dues have been received

No 21, Carl F Riley, 7054 Veronica Road, Upper Darby, Penna , No 22, Morris Garfinkle, 2319 Voorhies Ave , Brooklyn, N Y , No 23, Harry H Leiter, 624 Pricce St , Pismo Beach, Calif , No 24, Amelia Carmel De Dominiers, 2621 E Madison St , Baltimore, Md , No 25, Charles Greenberg, Wittel Dormitory, Auburn, Ala , No 26, Alfred R Biamonte, 403 37th St , Union City, N J , No 27, Joseph S Goldwag, 600 Lafayette Ave , Brooklyn, N Y , No 28, Abraham Louis Schneider, 2943 Thomas St , St Louis, Mo , No 29, Sigrid Maria Van Schaack, 614 Linden Ave , Wilmette, Ill , No 30, Daniel O Wolff, 21 Felton Place Melrose, Mass , No 31, Alexander V Morgenstern 12 John St New York, N Y , No 32, Maybelle Fernold, 700 Fullerton, Chicago, Ill , No 33, Richard H Herbine, 113 No 13th St , Newark, N J No 34 Cary Melville Turner, 3500 Armstrong, Dallas, Texas, No 35, Jagadish Kumar Lahiri, c/o The American Express Co , Calcutta, India

(Motion No 9) Vote on applications for membership in the American Pharmaceutical Association

E F KELLY, Secretary

LETTER NO 7

October 29, 1935

To the Members of the Council

36 Date When N F VI Will Become Official Motion No 6 (Council Letter No 6, page 1034) has been carried and the N F VI will become official on June 1, 1936 The Mack Printing Company has been authorized and directed to print upon the title page of the N F VI the words "Official from June 1, 1936 "

37 Official Coupon for N F VI Motion No 7 (Council Letter No 6, page 1034) has been carried and the coupons will be prepared in accordance

38 Use of the Test of the N F VI Motion No 8 (Council Letter No 6, page 1035) has been carried and Dr Bernard Fantus has been advised

39 Election of Members Motion No 9 (Council Letter No 6, page 1035) has been carried and applicants for membership numbered 21 to 35, inclusive are declared elected

40 Publication Date for N F VI The Mack Printing Company has advised that the U S P XI and the N F VI will be completed early in December and that they expect to have the books distributed throughout the country so that they can be released for sale on December 16, 1935 The Board of Trustees of the U S P Convention have approved this date as the official date of publication for U S P XI and the Council is requested to take similar action in order that the books will be released on the same date

(Motion No 10) It is moved by DuMez that December 16 1935, be approved as the official date for the publication of the N F VI, and that the Mack Printing Company be so advised and directed

41 Color of Cover and Label for N F VI It was decided some time ago that the buckram for the cover of N F VI should be of the same quality as that used for N F V and should be maroon in color The stock for the first printing of 25,000 copies was ordered at that time The label to be imprinted on the back-bone of the book will be in gold on black similar to that on N F V, and will bear the words "National Formulary—Sixth Edition—1936 "

42 Applicants for Membership The following applications properly endorsed and accompanied by the first year's dues have been received

No 36, Robert Latta Crowe, 874 Union Ave , Memphis, Tenn , No 37, Newell W Turrell, 33 East St , Warren, Mass , No 38, Wilbur R Borst, 210 Charles Ave , Staten Island, N Y , No 39, James Comstock Tingle, 345 North Broadway, Lexington, Ky , No 40 Lloyd B Edwards,

427 Central Ave. San Francisco Calif. No. 41 Robert E. Richards R. F. D. 3 Box 453 Lodi Cal. No. 42 Maurice G. Dixon 427 Central Ave. San Francisco Calif. No. 43 John Shepard Puller Saratville Md.

(Motion No. 11) *Vote on offer of new membership price for the American Pharmaceutical Association*

E. F. Kelly Secretary

LETTER NO. 8

November 19 1935

To the Members of the Council

40 *Publication of Bulletin No. 10* (Council Letter No. 7 page 1035) has been carried and the Mack Printing Company has been so advised. Attached is copy of Bulletin No. 3 officially announcing the publication date of N. F. VI and the date when it will become official and replace N. F. V.

41 *Executive Members* Motion No. 11 (Council Letter No. 7 page 1033) has been carried and applications of membership numbered 1 to 43 inclusive are declared elected.

42 *Flexible Leather Binding for N. F. VI* A retail price of \$7.00 per copy for N. F. VI in Flexible Leather Inter-locked Binding was set in Council Letter No. 8 1934-1935 page 12-14 dated November 9 1934 and this was confirmed at the meeting of the Executive Committee held in Washington on January 1 1935. Since that time it has become apparent that a Flexible Leather Binding without interlocks will be preferred for N. F. VI as well as for U. S. P. XI.

The Mack Printing Company was requested to furnish a price on this binding and quoted \$3.97 per copy and a return of \$4.02 per copy to the Association if a retail selling price of \$8.00 per copy was set. The U. S. P. Board of Trustees have set a retail price of \$7.00 per copy for the U. S. P. XI Flexible Leather Binding without interlocks.

(Motion No. 12) *It is moved by Duffell that the price of the Mack Printing Company of \$3.97 per copy for N. F. VI in Flexible Leather Binding be reduced to \$4.02 per copy in the 4th proof accepted and made a price concession for former orders and justified thereon and that of N. F. VI and no retail selling price for N. F. VI in Flexible Leather Binding be set at \$8.00 per copy.* A vote on this motion is called for at this time. It will be considered tentative if there is objection or if members of the Council desire to submit comments.

43 *Special Committee on Emblem* - *See 43rd Item* - Please see Item No. 143 Council Letter No. 22 1934-1935 page 70-71. A. P. H. A. JOURNAL for August 1935. In accordance with the action taken Chairman Hill on his appointment of George D. Beal Chairman Edward Kremers W. A. Hamer Charles H. LaWall and E. G. Eberle as members of the Special Committee to consider this matter and to report to the Council.

In the meantime a request has been received from Dr. Hamer Assistant Director of the Mellon Institute of Industrial Research to use the emblem of the Association in an appropriate manner in the new building of the Institute with the statement that with the approval of the A. P. H. A. the present emblem carrying the letters A. P. H. A. will be used and that when and if a new emblem replaces it the Institute will have the new device executed in replica and put in the place of the reproduction of the present emblem.

(Motion No. 13) *It is moved by Eberle that the Mellon Institute be granted permission to use the present emblem of the Association in the manner explained above with the understanding that the reproduction will be replaced by that of a new emblem when and if shall be approved.* A vote is called for at this time. It will be considered as tentative if there is objection or if members of the Council desire to submit comments.

44 *Correction in the Minutes of the Council* Dr. Fischel has called attention to two errors in the minutes of the Council as submitted in Council Letter No. 22 1934-1935. The members of the Council are requested to change the term 'Director of Publications' to 'Director of Publications' in paragraph three under Item 123 page 699 A. P. H. A. JOURNAL, August 1935 and to change the word 'estimate' to 'entrusted' in recommendation (3) in the report of the Committee on Research Item 136 pages 702-703 of the same issue of the JOURNAL.

45 *Use of Text of N. F.* The following letter from C. W. McClintock Director Laboratory Supply Stores Ohio State University Columbus Ohio

Our Department contemplates the compilation of a Formulary to be used on our campus here at Ohio State University. In our Formulary we wish to use certain portions of the text of

the National Formulary Will you kindly advise us where we may obtain such permission or else refer our request to the proper authority directly?" It was referred to Chairman DuMez of the Committee on Publications who wrote as follows

"In response to the request of C W McClintock, Director of Laboratory Supply Stores of Ohio State University, it is moved that permission be granted to use portions of the text of the National Formulary for comment or otherwise in the compilation of a formulary to be used on the campus at Ohio State University and that no charge be made therefore

"I offer this motion at this time because I feel that we have so much precedent for granting permission in similar cases that it would be going to unnecessary trouble to refer this to the Publication Committee "

(Motion No 14) It is moved by DuMez that permission be granted to use portions of the text of the National Formulary for comment or otherwise in the compilation of a formulary to be used on the campus of the University of Ohio and that no charge be made therefore, with the understanding that the formulary will not be issued until after the N F VI is released for sale A vote on this motion is called for at this time but will be considered as tentative if there is objection or if members of the Council desire to submit comment

49 *American Association for the Advancement of Science* On August 28th, the A A A S was informed of the adoption by the A P H A of two resolutions relating to that ASSOCIATION as given on pages 712 and 713 of the August 1935, issue of the A P H A JOURNAL The following letter dated October 29th, has been received from Permanent Secretary Henry B Ward

"At a recent meeting of the executive committee of the ASSOCIATION held in this city your letter of August 28th, was laid before the members and entered in the record of the occasion

"I am writing to tell you that the committee appreciates genuinely the action you took in expressing your gratification of the arrangements agreed upon

"On our part I may say that we were indebted to you for the prompt action in appointing delegates to the Seventh Pan American Scientific Congress which was held in Mexico City last September You will be interested to know that because of your prompt action and that of various other affiliated societies a conspicuous part of the American delegation at the Congress in Mexico City consisted of representatives from this ASSOCIATION and its affiliated societies

"With best wishes for the continued and increasing success of your organization and in the confident hope that the relations established may serve as an important element in the advancement of science "

50 *Appointment of Committees and Delegates* President Costello has made the following appointments Committee on Cosmetics, Maison de Navarre Detroit, Mich is added to the membership, Delegates to National Drug Trade Conference James H Beal Robert P Fischelis and E F Kelly are named as delegates to the Conference for 1935-1936

President Costello writes as follows

"It is my belief that the purpose of the Conference can be best served by those who have long been familiar with its practices and functions and that the provision for appointment of three delegates annually should be supplanted by a provision for three-year terms for each delegate, one to be appointed annually

"Since no instructions are given to delegates who participate in the Conference by their respective Associations, I assume each delegate is privileged to exercise its own judgment as to their policy or attitude toward it

"I am convinced that the Drug Trade Conference is a useful institution which has served a useful purpose, and will continue to be so if it is held in regard by the delegates as a Conference and not treated as a super drug organization

"In discharging my responsibility to the AMERICAN PHARMACEUTICAL ASSOCIATION in the appointment of its delegates I do so in the belief that you will effectively serve the Conference without prejudice, and the ASSOCIATION

51 *Applicants for Membership* The following applicants properly endorsed and accompanied by the first year's dues have been received

No 44 Leonard D Powers, 715 S Wood St Chicago, Ill , No 45 H A Sasse, Redfield S Dak , No 46 E E Miller, Davenport Wash , No 47, Edwin Martin Durand 133 W Milton Ave Rahway, N J , No 48 Paul David Carpenter 665 South St Elgin, Ill , No 49, Joseph C Oenasek, 1121 Washington, Blvd , Oak Park Ill , No 50 Roy E Phillips, 3423 S Flores St San

(Motion No 11) *Vote on applications for membership in the American Pharmaceutical Association*

E F Kelly, *Secretary*

LETTER NO 8

November 19, 1935

To the Members of the Council

43 *Publication Date for N F VI* Motion No 10 (Council Letter No 7, page 1035) has been carried and the Mack Printing Company has been so advised Attached is copy of Bulletin No 3, officially announcing the publication date of N F VI and the date when it will become official and replace N F V

44 *Election of Members* Motion No 11 (Council Letter No 7, page 1036) has been carried and applicants for membership numbered 36 to 43, inclusive, are declared elected

45 *Flexible Leather Binding for N F VI* A retail price of \$7 00 per copy for N F VI in Flexible Leather Interleaved Binding was set in Council Letter No 8 1934-1935 page 1244, dated November 9 1934 and this was confirmed at the meeting of the Executive Committee held in Washington on January 4 1935 Since that time it has become apparent that a Flexible Leather Binding without interleaves, will be preferred for N F VI as well as for U S P XI

The Mack Printing Company was requested to furnish a price on this binding and quoted \$0 97 per copy and a return of \$4 32 per copy to the ASSOCIATION if a retail selling price of \$6 00 per copy was set The U S P Board of Trustees have set a retail price of \$6 00 per copy for the U S P XI Flexible Leather Binding without interleaves

(Motion No 12) *It is moved by DuMez that the quotation of the Mack Printing Company of \$0 97 per copy for N F VI in Flexible Leather Binding with a return of \$4 32 per copy to the A Ph A be approved and made a part of the contracts for the manufacture and for the distribution and sale of N F VI and that the retail selling price of the N F VI in Flexible Leather Binding be set at \$6 00 per copy* A vote on this motion is called for at this time It will be considered tentative if there is objection or if members of the Council desire to submit comments

46 *Special Committee on Emblem for the Association* Please see Item No 143, Council Letter No 22, 1934-1935 page 704 A Ph A JOURNAL for August 1935 In accordance with the action taken, Chairman Hilton has appointed George D Beal *Chairman* Edward Kremers W A Hamor Charles H LaWall and E G Eberle as members of the Special Committee to consider this matter and to report to the Council

In the mean time, a request has been received from Dr Hamor Assistant Director of the Mellon Institute of Industrial Research, to use the emblem of the ASSOCIATION in an appropriate manner in the new building of the Institute with the statement that with the approval of the A Ph A the present emblem carrying the letters A Ph A will be used and that when and if a new emblem replaces it, the Institute will have the new device executed in replica and put in the place of the reproduction of the present emblem

(Motion No 13) *It is moved by Eberle that the Mellon Institute be granted permission to use the present emblem of the Association in the manner explained above with the understanding that the reproduction will be replaced by that of a new emblem when and if it shall be approved* A vote is called for at this time It will be considered as tentative if there is objection or if members of the Council desire to submit comments

47 *Correction in the Minutes of the Council* Dr Fischelis has called attention to two errors in the minutes of the Council as submitted in Council Letter No 22 1934-1935 The members of the Council are requested to change the term "Director of Publicity" to "Director of Publications" in paragraph three under Item 123 page 699, A Ph A JOURNAL, August 1935, and to change the word "estimate" to "entrusted" in recommendation (3) in the report of the Committee on Research, Item 136 pages 702-703 of the same issue of the JOURNAL

48 *Use of Text of N F* The following letter from C W McClintock, Director, Laboratory Supply Stores, Ohio State University, Columbus Ohio

'Our Department contemplates the compilation of a Formulary to be used on our campus here at Ohio State University In our Formulary, we wish to use certain portions of the text of

the National Formulary Will you kindly advise us where we may obtain such permission or else refer our request to the proper authority directly?" It was referred to Chairman DuMez of the Committee on Publications who wrote as follows

"In response to the request of C W McClintock, Director of Laboratory Supply Stores of Ohio State University, it is moved that permission be granted to use portions of the text of the National Formulary for comment or otherwise in the compilation of a formulary to be used on the campus at Ohio State University and that no charge be made therefore

"I offer this motion at this time because I feel that we have so much precedent for granting permission in similar cases that it would be going to unnecessary trouble to refer this to the Publication Committee "

(Motion No 14) It is moved by DuMez that permission be granted to use portions of the text of the National Formulary for comment or otherwise in the compilation of a formulary to be used on the campus of the University of Ohio and that no charge be made therefore, with the understanding that the formulary will not be issued until after the N F VI is released for sale A vote on this motion is called for at this time but will be considered as tentative if there is objection or if members of the Council desire to submit comment

49 *American Association for the Advancement of Science* On August 28th, the A A A S was informed of the adoption by the A P H A of two resolutions relating to that ASSOCIATION as given on pages 712 and 713 of the August 1935 issue, of the A P H A JOURNAL The following letter, dated October 29th, has been received from Permanent Secretary Henry B Ward

"At a recent meeting of the executive committee of the ASSOCIATION held in this city your letter of August 28th was laid before the members and entered in the record of the occasion

"I am writing to tell you that the committee appreciates genuinely the action you took in expressing your gratification of the arrangements agreed upon

"On our part I may say that we were indebted to you for the prompt action in appointing delegates to the Seventh Pan American Scientific Congress which was held in Mexico City last September You will be interested to know that because of your prompt action and that of various other affiliated societies a conspicuous part of the American delegation at the Congress in Mexico City consisted of representatives from this ASSOCIATION and its affiliated societies

"With best wishes for the continued and increasing success of your organization and in the confident hope that the relations established may serve as an important element in the advancement of science "

50 *Appointment of Committees and Delegates* President Costello has made the following appointments Committee on Cosmetics, Maison de Navarre, Detroit Mich is added to the membership, Delegates to National Drug Trade Conference James H Beal, Robert P Fischelis and E F Kelly are named as delegates to the Conference for 1935-1936

President Costello writes as follows

"It is my belief that the purpose of the Conference can be best served by those who have long been familiar with its practices and functions and that the provision for appointment of three delegates annually should be supplanted by a provision for three-year terms for each delegate one to be appointed annually

"Since no instructions are given to delegates who participate in the Conference by their respective Associations, I assume each delegate is privileged to exercise its own judgment as to their policy or attitude toward it

"I am convinced that the Drug Trade Conference is a useful institution which has served a useful purpose, and will continue to be so if it is held in regard by the delegates as a Conference and not treated as a super drug organization

"In discharging my responsibility to the AMERICAN PHARMACEUTICAL ASSOCIATION in the appointment of its delegates I do so in the belief that you will effectively serve the Conference without prejudice, and the ASSOCIATION "

(Motion No 15) Vote on applications for membership in the American Pharmaceutical Association

52 Meeting of the Council It was understood that the meeting of the Council in December would be held just before or just after the annual meeting of the National Drug Trade Conference as several members of the Council are also delegates to the Conference

The annual meeting of the Drug Trade Conference will be held on Friday, December 6th either Thursday the 5th or Saturday the 7th is convenient for President Costello and for those members of the Council living in Washington

The members of the Council are requested by Chairman Hilton to indicate on the enclosed voting card which day is preferred for the Council meeting

E F Kelly, *Secretary*

"ABSORPTION OF DRUGS BY THE HUMAN SKIN"

Iodine, Potassium Iodide, Methyl Salicylate and Quinine Dihydrochloride were applied in the form of ointment (Petrolatum Benzoinated Lard and Lanolin being used as the bases), and, in the case of Iodine also as tincture and aqueous solution The presence of the drug itself or of derivatives in the urine was accepted as a criterion of absorption The influences of the ointment base, alcohol and water as the solvent age sex, complexion site of application and nature of the drug itself on the absorption by the skin are disclosed

* Abstract of a paper before Scientific Section, A PH A, Portland meeting, 1935—by A Richard Bliss, Jr

EDITORIAL NOTES

On account of other matter, reports and papers this section has only a few pages. The reports of the Portland meeting will be concluded in the December issue.

The U S Pharmacopoeia XI and National Formulary VI will be on sale December 16th, but will not be official until June 1, 1936.

MEETING OF THE COUNCIL A PH A

A meeting of the Council of the AMERICAN PHARMACEUTICAL ASSOCIATION will be held in Washington at the AMERICAN INSTITUTE OF PHARMACY, December 5th, to discuss various matters referred to this meeting at Portland.

JOURNAL EXCHANGES

The JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION will exchange other copies for that of January 1922, and that of September 1914.

CERTIFICATE ISSUED TO CONTRIBUTORS TO CENTURY OF PROGRESS FUND

A certificate of participation has been awarded by the AMERICAN PHARMACEUTICAL ASSOCIATION and the Local Committee, signed by the officers, to those who contributed to the fund and made the Pharmacy Exhibit possible.

CHRISTMAS SEALS

The campaign against tuberculosis is meeting with success. Such is the verdict of physicians and of statisticians whose business it is to study mortality rates. But the battle is not yet won.

Rather, it is indicated that, because of widespread poverty resulting from the depression some of the gains of recent years may be lost. The white plague always has been a poor man's disease. It has a definite relation to economic stress. When times are hard it prospers. Support by purchasing Christmas Seals affords an opportunity to help the cause.

UNITED STATES CIVIL SERVICE EXAMINATION

The United States Civil Service Commission has announced an open competitive examination as follows:

SENIOR CHEMIST (DISTILLATION)

Applications for the position of senior chemist (distillation) must be on file with the U S

Civil Service Commission, Washington, D C, not later than January 6, 1936. At present there is a vacancy in the Alcohol Tax Unit, Treasury Department, which will be filled as a result of this examination.

The entrance salary is \$4600.00 a year, subject to a deduction of 3½ per cent toward a retirement annuity.

Applicants must have been graduated with a bachelor's degree from a college or university of recognized standing upon the completion of at least 118 semester hours, majoring in chemistry or chemical engineering. In addition, except for the substitution provided below, they must show, as a minimum, experience, *acquired since graduation*, of length and quality indicated below. At least 6 years of responsible progressive professional experience in scientific chemical work of an investigative or process development nature, at least 2 years of which must have been in the practice and theory of distillation technique involving the separation of low-boiling fractions and azeotropic mixtures. Experience in the manufacture and use of 'metallo organic' compounds and in the use of activated carbon or other adsorbents in filtration technique is highly desirable and additional credit will be given for experience of this character.

Full information may be obtained from the Secretary of the United States Civil Service Board of Examiners at the post office or customhouse in any city which has a post-office of the first or the second class, or from the United States Civil Service Commission, Washington, D C.

ABSTRACT OF U S P CHANGES

Additional abstracts of proposed changes in the Eleventh Revision of the U S Pharmacopoeia are now available for the following subjects:

Part II—Proximate Assays

Part III—Volatile Oils

Part IV—Extracts, Fluidextracts and Tinctures—Solutions, Spirits and Syrups—Cerates, Ointments and Miscellaneous Galenicals

Part V—Botany and Pharmacognosy

Part VI—Organic Chemicals

Copies of these abstracts may be obtained by addressing the chairman of the Committee of Revision. There is no charge.

PERSONAL AND NEWS ITEMS

Dr R Eder, member of the AMERICAN PHARMACEUTICAL ASSOCIATION and head of the Pharmaceutical Institute Zurich, Switzerland, has made an extended tour of Canada and the United States. He is accompanied by his wife, who also is a scientist and member of a number of Women's organizations in the scientific field.

Dr Eder is making a study of the pharmaceutical institutions and of pharmaceutical and chemical manufacturing plants with a purpose of embodying some of the ideas in the curriculum of the institution of which he is the head. Further comment will be made in the next issue of the JOURNAL. At this writing the visitors are in Washington.

John Uri Lloyd, veteran member and also as former president of the AMERICAN PHARMACEUTICAL ASSOCIATION, has returned from a visit to Japan. He arrived in Japan September 26th, and, as stated, returned safely and in good health from this extended journey.

James H. Breasted, noted Egyptologist who was among those first to enter Tutankhamen's tomb, is reported critically ill. He is a noted author, lecturer, recipient of many degrees honored by universities, organizations here and abroad, and by many countries. He is also a graduate of the Chicago College of Pharmacy before taking up the researches which made him famous throughout the world. He died December 2nd.

Dr J. J. Durrett has been reappointed chief of the drug division of the United States Food and Drug Administration a position which he held for some time until his resignation four years ago.

During the past four years Dr Durrett has been director of professional relations for E. R. Squibb & Sons. He has resigned that post effective January 1st to return to the Government service.

Dr Ole Givold is now a member of the University of Minnesota staff of the Department of Pharmaceutical Chemistry under Dr C. H. Rogers.

Dr Howard B. Lewis, University of Michigan, returned from a month's lecture tour to the Pacific coast and return under the auspices of the Biochemistry Section of the American Chemical Society.

The University of Buffalo is planning for a Golden Jubilee Banquet on April 22, 1936.

celebrating the 50th anniversary of the School of Pharmacy. An oil portrait of Dr Willis G. Gregory, who has been a member of the faculty since its founding, will be a gift of the Alumni of the School of Pharmacy.

On October 29th, the Mercer Club, Buffalo, honored him at a luncheon.

Dr Charles Campbell, of Washington, D. C., presented to the AMERICAN INSTITUTE OF PHARMACY two mortars: one a Wedgwood and the other a large porcelain mortar. They were given to Dr Campbell by Mrs. Drane and had been in use for many years by the late Dr. Marcellus MacKenzie of Charlottesville, Va. They date back to about 1846.

Andrew Scherer's 80th birthday was celebrated by the Chicago Veterans' Association on November 21st. The guest of honor has been a member of the AMERICAN PHARMACEUTICAL ASSOCIATION for more than 50 years.

M. R. MacFarland succeeds the late J. F. Roberts as Registrar-Treasurer of Ontario College of Pharmacy.

Malcolm G. Gibbs, founder of People's Drugstores, was feted October 29th by his fellow citizens on the occasion of the 30th anniversary of founding the stores of which he is the head. Normal C. Kral, president of the Advertising Club, presided at the dinner. A letter of congratulations was received from President Roosevelt.

Armour and Company will open a new pharmaceutical manufacturing laboratory at Chicago. In addition, new research laboratory facilities will be established devoted to scientific investigation of organotherapeutic remedies. The new pharmaceutical equipment will be housed in the same building with other Armour laboratory facilities so that research equipment may be fully utilized.

QUAKE INJURIES

The Starz Pharmacy, Helena, Mont., received a severe blow and although the prescription room was not seriously damaged, the front room stocks were thrown on the floor by the swaying of the wall. C. H. Herman, proprietor of the Starz Pharmacy, estimates his damage at between \$400.00 and \$500.00. Sympathy is expressed. Carl Herman and Emil Starz are members of the AMERICAN PHARMACEUTICAL ASSOCIATION.

CHARLES E DOHME MEMORIAL LECTURESHIP

The eleventh course of lectures of the Charles E Dohme Memorial Lectureship was given during November at Henry M Hurd Memorial Hall Baltimore, by Professor James A Gunn, director of the Nuffield Institute of Medical Research, University of Oxford

PHARMACY WEEK

Dean Ernest Little gave a radio address on "The Romance of Pharmacy" on a special Pharmacy Week Program, on coast to coast network of the Columbia Broadcasting System

University of Florida broadcasted addresses by E H Rauch, B L White, E J Ireland, Victor Wray, Max S Adler and C G Hamilton A Pharmacy convocation was part of the week's program Edward S Rose of Boerner's Prescription Pharmacy, Iowa City displayed a Pharmacy Week window based on the Code of Ethics of AMERICAN PHARMACEUTICAL ASSOCIATION—1, The Pharmacist and the Public, 2, The Pharmacist and the Physician, 3, Relation of Pharmacists to Each Other Certificates of membership in Associations, U S Phar-

macopœia National Formulary and eighty preparations of these standards were displayed

The following is quoted from a radio talk — "To day more than a million dollars worth of vaccines and scrums have been shipped into Africa from pharmaceutical laboratories of America and Europe, to safeguard soldiers from infection"

The apothecary's art, bound up of old with mystery and superstition, has gone completely modern It has none of the dusty, shabby-genteel aspect of old legends The present trend is to make the prescription department the heart of the store, with ware and apparatus accurate, immaculate and aseptic This same spirit is reflected in other departments, where everything from cosmetics to ice cream sodas may be vended, all under professional supervision To the consumer, this means simply better health protection in a variety of ways Some day the public will demand of all retail stores that they be clean and well equipped, adequately lighted and conveniently arranged for sanitary display of merchandise The pharmacy, which has never lost its influence as a community gathering place, is leading the parade toward modernization"

OBITUARY

JOSEPH F HINDES

Joseph F Hinds, President of Emerson Drug Company, Baltimore, and member of the AMERICAN PHARMACEUTICAL ASSOCIATION, died October 29th, aged 73 years He entered the employ of Emerson Drug Company in 1890, a year after the founding of the latter by Captain Isaac E Emerson Upon the death of the latter, he became president of the Company He was also vice president of the Citro Chemical Works of America and the Maryland Glass Corporation

FREDERICK H FRICKE

Frederick Henry Fricke, St Louis druggist and former pure food and drug commissioner of Missouri, was found dead November 15th in a room at the Auditorium Hotel, 1803 Pine Street He was head of the Fricke Hahn Drug Company and had been in the drug business in St Louis for about thirty-five years He was active in the campaign in St Louis for funds for the Headquarters of the AMERICAN

Mr Fricke was a former president of the Missouri Pharmaceutical Association and active in association matters He is survived by his widow and a daughter, Mrs Ethel Feldhaus

William Livingston Crounse, for twenty years Washington representative of the National Wholesale Druggists' Association until his retirement in 1934 died at his home in Washington, November 21st, aged seventy-four years

Mr Crounse was born in Milwaukee, the son of Lorenzo Livingston Crounse and Mary C Collins Crounse He attended the Washington public schools and was graduated from Harvard University in 1884 He is survived by his widow

J Fred Windolph, for a number of years member of the AMERICAN PHARMACEUTICAL ASSOCIATION, died November 1935, aged 71 years He was a director and former secretary of Norwich Pharmacal Company

Mr Windolph was graduated from the Philadelphia College of Pharmacy in 1885 and until 1899 was active as retail pharmacist in

Dover, Del, and Brooklyn, N Y He was prominent in Masonic circles

C Louis Dohme, one of the founders of Sharp & Dohme died in Boston Since his retirement Mr Dohme has resided in Atlantic Beach, Fla He is survived by his widow and three children

Thomas A Buckland, former city chemist of

St Louis and for a number of years president of St Louis College of Pharmacy, died October 13th, aged 71 years His widow survives the deceased

Dr Edward Starr Judd died November 30th, in Chicago of pneumonia, aged 57 years He was chief of the Mayo surgical staff Dr Judd held that society would be helped if the people were educated along medical lines

SOCIETIES AND COLLEGES

DRUG TRADE CONFERENCE TO MEET DECEMBER 6TH

The National Drug Trade Conference will hold its annual meeting here December 6th in the Washington Hotel In addition to the regular committee reports the conference will discuss the pending Federal food and drug bill proposals to continue the NRA idea State fair trade laws and other legislative proposals — *Oil Paint and Drug Reporter*

ASSOCIATION OF OFFICIAL AGRICULTURAL CHEMISTS

The Association of Official Agricultural Chemists held its fifty first annual meeting in Washington during the week of November 11th The Wiley memorial address was delivered by Dr W H MacIntire of the University of Tennessee

About twenty five methods were dropped from the A O A C book because the methods appear in the forthcoming U S P or N F The following officers were elected

President, H H Hanson State Board of Agriculture, Dover, Del, *Vice President*, C C McDonnell, Washington, *Secretary Treasurer*, W W Skinner U S Bureau of Chemistry and Soils, Washington, additional members of the *Executive Committee*, H R Kraybill La Fayette, Ind, W S Frisbie Washington, C L Hare, Auburn, Ala, and the retiring president, F E Blanck Washington

IDAHO PHARMACEUTICAL ASSOCIATION

Idaho State Pharmaceutical Association issues *bulletins* and a suggestion from that of No 15 is that they are sending information to pharmacists of the state of important publicity In this way the druggists of Idaho are kept in touch with important legislation and other matters

Another activity is the issuance of prizes to young men for competitive papers The prize winner announced in the bulletin for November 15th, presented the subject, What Is Wrong with the Drug Business?

DISTRICT OF COLUMBIA PHARMACEUTICAL ASSOCIATION

The District of Columbia Pharmaceutical Association will meet at Raleigh Hotel December 10th A report will be made on legislative matter among the subjects will be the consideration of minimum equipment, barbituric acid regulations a uniform narcotic law

The pharmacists of the District of Columbia have taken active part in accident prevention Frequently pharmacists are called upon to render first aid to persons injured in automobile accidents and gain first hand information relative to accidents

OFFICERS ARIZONA PHARMACEUTICAL ASSOCIATION

Arizona Pharmaceutical Association at the annual meeting held in Tucson elected the following officers

President Fred W Moore Flagstaff, *First Vice President*, Andrew Martin Tucson, *Second Vice President* N W Stewart Phoenix *Treasurer*, A M Burch, Phoenix, *Executive Committee* L R Johnson Tucson J B McDonald Jerome, J B Ryan, Globe, H W Vestal Somerton, W C Denson, Mesa, *Executive Secretary* Lawrence Evans

A NEW APPROACH TO LEGALIZED FAIR TRADE

Drug Topics is asked by Dr Robert L Swain, chairman of the N A R D Committee on National and State Fair Trade Legislation, to emphasize that the proposed National Fair Trade Enabling Act," published in *Drug Topics*

for October 28th, while "correct as to principle is only tentative as to phrasing." Between now and January when Senator Tydings of Maryland will present the proposal on the opening day of Congress, the measure is to be subjected to intensive study and this may lead to slight changes in phrasing.

CODE FUNDS GO TO PHARMACY BOARD

Retail druggists in the First Congressional district of Oregon, recently voted to give the funds, still in the hands of the Code Authority of that district, to the Oregon Board of Pharmacy, to assist in enforcement of the pharmacy laws. The amount is approximately \$200.00. A ruling by the attorney-general authorizes the board to accept such funds. Stanley Stevenson, of Eugene, was chairman of the Code Authority for that district.

PROTECT RIGHT TO EXIST

Senator Millard Tydings in his address before the N. A. R. D., in Cincinnati, said:

The problems of the retail druggist, are first, the general problems of the country, and second, his individual problem. Naturally the druggist cannot prosper unless the whole country prospers, and, therefore, while naturally we think first of our immediate business we should not lose sight of the larger aspect of the matter for it is the paramount foundation upon which trade revival and business recovery must be built. More intimately, however, the retail druggist is facing a desperate battle as he sees loss leader selling activities threatening more and more his very existence. By sensibly and soundly marshalling your forces, measures can be enacted which will at least minimize the dangers from this source and I know you shall evolve the solution and eventually by your seasoned effort accomplish the results desired. However, let me close with an appeal to you as citizens of this great nation to more and more lift your eyes beyond the problems of your immediate business to that of the country as a whole, for from the country as a whole come your customers who cannot buy unless they are employed, who cannot be employed unless there is a demand for their goods, and so, therefore, even with your own business problem solved, your business cannot go ahead except the country goes ahead."

ANNUAL REPORT ON DRUG CONTROL WORK

Dr. W. G. Campbell, Chief of the Food and

Drug Administration, has rendered the annual report of the Food and Drug Administration, of the fiscal year ending June 30, 1935. He states that the ether supply is much better and ampuls make a greater showing, out of ninety-six samples submitted for biological assay of imported crude drugs, six were held out of 431 samples of domestic drug preparations, thirty-two required action.

GORGAS MEMORIAL INSTITUTE

Rear Admiral Cary T. Grayson was reelected chairman of the Gorgas Memorial Institute of Tropical and Preventive Medicine at the annual election, November 13th. Other officers were also reelected.

Report was made on certain experiments started about six years ago on the control of malaria in Panama. The experiments include treatment with medicinal substances.

INTERNATIONAL SERUM CENTER IS ESTABLISHED

The Royal Danish Serum Institute at Copenhagen will become a sort of international clearing house for serums used in treating or preventing disease, as a result of action taken by the Eleventh Congress of Biological Standardization held in connection with the League of Nations Hygiene Congress.

The Danish Institute has been appointed the international center for preparation and standardization of serum for such diseases as dysentery, lockjaw, diphtheria, pneumonia and wound fever. London will similarly become the international center for vitamins, insulin and the sex hormones.

International standards for the preparation and composition of twenty-five of the medications to be distributed from Copenhagen and London have been agreed on by the Congress.—*Science News Letter*

TRAFFIC IN OPIUM AND OTHER NARCOTICS

The U. S. Treasury Department has issued the annual report, ending December 1934, on traffic in opium and other dangerous drugs. It is pleasing to note that the percentage of violations by druggists is comparatively small. The greater number of violations by far are those by illegitimate dealers and distributors. Care is evidenced by legitimate dealers in all activities.

W. Bruce Philip, in his *bulletin* of October 28th, admonishes druggists that Fair Trade

legislation faces a critical period and all associations and druggists should contribute efforts to bring this new legislation into Congress. It will be helpful if the individual in discussing such legislation will get the viewpoint of the Congressmen, so that if there are points which should be corrected discussion by those who are studying the legislation can meet the objections.

HISTORY REPEATS IN AMERICAN MEDICAL EDUCATION

The *Journal of the A M A*, for September 21st, comments that the factors which brought about unsatisfactory conditions are again at work, as a result of dependence on tuition fees. The tendency has been receiving attention of the Council and it is suggested that educators, state boards of examination physicians and public authorities may well also give it their consideration. Statistics given in the comment are quoted in part:

"Thirty years ago there were in the United States 160 medical schools with an enrollment of 26,147. Ten years later as a result of the investigation of the Council on Medical Education and of the publicity afforded by the Carnegie Foundation for the Advancement of Teaching, the number of schools had been reduced to ninety six and the enrollment to 14,891. Shortly after 1918 when the war ended, there was manifested a tendency to increase, in 1925 the number of students was 18,200. During the academic year just closed it was 22,888. We have returned nearly to

the place where we were when the Council was created. True, the number of schools has not increased with the growing enrollments of recent years."

THE NATIONAL FORMULARY, SIXTH EDITION

The AMERICAN PHARMACEUTICAL ASSOCIATION announces that its Council has officially approved December 16, 1935 as the date when the new N F VI will be released for sale in all parts of the country, and has also approved June 1, 1936 as the date when the N F VI will become official and will supersede the N F V.

As previously announced, the N F VI will be distributed for the ASSOCIATION by the Mack Printing Company of Easton, Penna.

The new National Formulary represents a complete and thorough revision of N F V. Admissions and deletions are based on information obtained in the U S P N F Prescription Ingredient Survey. This survey was made to determine the materials prescribed and the extent of their use throughout the country. The N F VI therefore supplements the scope of the Pharmacopœia and supplies additional information on simples, formulas, diagnostic reagents and standards required by the pharmacist in the practice of his profession.

Of the 689 monographs in the N F VI, 208 are Drug or Chemical Monographs and 481 are Monographs of Pharmaceutical Preparations. The more important additions have been in the monographs for ampuls, tablets, fluid extracts, syrups, tinctures and ointments.

LEGAL AND LEGISLATIVE

OHIO STATE UNIFORM NARCOTIC DRUG ACT

Secretary M. N. Ford of the Ohio Board of Pharmacy is sending out information on the new State Uniform Narcotic Drug Act which became effective September 6, 1935. In most respects, the compliance with the Federal Narcotic Act, will meet the requirements of the new State Act.

The Board has ruled that only those who desire to cultivate or grow Opium, Coca Leaves, Cannabis or other narcotic drugs, need to register and obtain a license as required under Section 12672-2. No license will be granted any applicant until and after an investigation has been made and the application approved.

The Board also ruled that Article 7 under Section 12672-16 does not prohibit the sale of Hypodermic Syringes or Hypodermic Needles.

Section 12672-8, Article 5 provides that manufacturers and wholesalers of Cannabis Indica or Cannabis Sativa shall be required to render with every sale of Cannabis Indica or Cannabis Sativa an invoice, whether such sale be for cash or credit, and such invoice shall contain the date of such sale, the name and address of the purchaser and the amount so sold. Every purchaser of Cannabis Indica or Cannabis Sativa, from a wholesaler or manufacturer shall be required to keep the invoice rendered with such purchase, for a period of two years.

Section 12672-5, Article 1, provides in part

that the pharmacist filling a narcotic prescription, shall write the date of filling and his own signature on the face of the prescription and the prescription shall be retained on file by the proprietor of the pharmacy in which it was filled for a period of two years. The prescription shall not be refilled.

Section 12672-7, Article 1, provides that no one except a pharmacist may sell exempt narcotic drugs and preparations. A complete record of all such sales must be maintained.

The penalty for violating the new Uniform Narcotic Drug Act is, for the first offense a fine of not exceeding five hundred dollars, (\$500.00), or imprisonment for not exceeding five years, or by both such fine and imprisonment, and for a subsequent offense, a fine of not exceeding one thousand dollars (\$1000.00) or imprisonment for not exceeding five years, or both such fine and imprisonment.

The law also provides for the revocation of the certificate of a pharmacist who is convicted of violation of this Act.

Section 12672-18 provides the Act shall be enforced by the State Board of Pharmacy and by all officers within the state. This is to be construed as applying to Federal State, County and Municipal officers.

ALL BRANCHES OF DRUG TRADE EVOLVE MARYLAND CONTRACTS

As result of a month of conferences among retail and wholesale druggists and drug manufacturers the fair trade committee of the Maryland Pharmaceutical Association, of which Simon Solomon is chairman, has succeeded in working out the form of contracts which the three divisions of the industry will be asked to sign. Printed copies of the contracts are going to retailers immediately.

Two copies of each contract will be sent to every retailer, and he will be requested to record on an attached slip his wholesale affiliations. The fact that he names one particular wholesaler, however, will not prevent him from dealing with any other wholesalers in the city.

CONTRACTS TO BE KEPT ON FILE

The retailer will be requested to send the copy of his wholesaler for his signature. The wholesaler, after stating his minimum prices will keep one copy and return the other to the retailer, who is to send it to the committee which will keep it on file as a record.

The idea in Maryland is to leave the operation of the plan entirely in the hands of the re-

tailers themselves, instead of giving the wholesaler the opportunity to control it. The committee plans a record of the fair trade stand of each firm in the trade.—*Drug Topics*, November 25 1935.

NEW YORK FAIR TRADE ACT HELD UNCONSTITUTIONAL

The New York Fair Trade Act was held unconstitutional in a decision handed down by Justice Frederick P. Close of the State Supreme Court, in White Plains, N. Y. Plaintiff was Doubleday, Doran & Co., book publishers, who sued R. H. Macy & Co. The same law was upheld in a prior ruling by Justice Philip A. Brennan, of Supreme Court in Kings County, in the case of Cooper & Cooper *versus* Angert.

Doubleday, Doran & Co., claimed they had made contracts with its retail subsidiary, Doubleday, Doran Bookshops, Inc., setting the retail price of certain books and that Macy was selling their books below the established minimum. Attorneys for both litigants agreed to the facts of the case so that it might be decided strictly on its constitutionality. Following the decision, Doubleday, Doran said appeal would be taken.

Justice Close held that although a law perhaps could be devised which would bring about resale price maintenance, 'the defects in this act are so seemingly patent that it must be declared invalid.' He said, 'Many writers on economic questions have long urged that legislative relief be granted against so-called price-cutting, maintaining that it is an economic evil that should be eradicated. That may be so but my present opinion is that our fundamental law must be changed before such an act as this can be upheld.' He added that if our organic law is to be held elastic enough to permit this type of act, it should be announced by the "court of last resort."

"The Administration has addressed itself to over-production, but not to the displacement of labor by machinery. It has endeavored to promote general business recovery through the N. I. R. A. Now that the Administration is asking for facts showing what happened before, during and since the operation of the National Industrial Recovery Act, it behooves industry to furnish them before December, or not expect any relief from Congress. This not only applies to the law that will supersede the N. I. R. A., if any, but to the passage of the Patman bill prohibiting discrimination in prices to purchasers and any bill amending the Sherman

Act so as to permit the making of contracts under state price maintenance laws by those engaged in interstate commerce"—*Brokmeyer Bulletin*

Clip sheet of November 10th, issued by the Press Service of the U S Department of Agriculture, indicates that ginger ale and some other beverages contain caffeine without making such a statement. The statement is further made that adding caffeine to ginger ale and soft drinks of that type changes their identity and tends to make them stimulating. These beverages are widely consumed by children and persons who are ill. A further comment is that the consumer is entitled to know when ginger ale, root beer and other beverages which ordinarily do not contain caffeine have been changed in this way. Recently a manufacturer of ginger ale was fined \$50.00 for failure to label his product as a caffeine containing drink.

METHOD FOR REVEALING MINUTE AMOUNTS OF LEAD ON FRUIT, IN FOODSTUFFS, AIR AND WATER

Analyzing fruit, foodstuffs and liquids to determine how much lead they contain is not easy—especially if the material to be analyzed is unusually small and the lead in it weighs only a few thousandths of a milligram. Yet such measurements may reveal to scientists a clearer understanding of the composition of organic and inorganic materials, promote better industrial hygiene, and be of great aid to the food industry. Development of an improved colorimetric method for determining minute quantities of lead was reported November 11th at the annual meeting of the Association of Official Agricultural Chemists at Washington, D C. It was developed by chemists of the Food and

Drug Administration, U S Department of Agriculture

THYROID AND HYPERINSULINISM

Strides made by medical science in treating thyroid deficiency and performing goiter operations were explained to the assembly of the Inter State Postgraduate Medical Association of North America, October 17th in Detroit, by Dr Charles H Mayo of Rochester, Minn, retiring president of the organization.

Treatment of hyperinsulinism was described by Dr E Starr Judd and Dr Edward H Rynearson, both of Rochester, Minn. Dr Rynearson said he opposed surgery in such cases unless it was definitely established that the patient could not be cured by medical treatment.

LEPERS CURED

Dr William Danner, general secretary of the American Leper Mission revealed that of the 750 lepers admitted to the hospital since 1921 a total of 171 have been paroled as "symptoms free." He estimated that there were more than 1000 lepers in this country.

The remarkable advance in the treatment and cure of leprosy was discussed by Raymond P. Currier, a director of the American Mission to Lepers at St Michael's Protestant Episcopal Church, Amsterdam Avenue and Ninety Ninth Street, New York City.

PHARMACY IN SHANGHAI

Figures recently published in Shanghai show that in the Shanghai Pharmaceutical Associations there are only twenty two members who are qualified pharmacists but that there are hundreds of shops selling drugs. In the French Concession there are 145 drug shops and only five of these are run by qualified men.

ADDITIONS TO THE HALL OF FAME

William Penn, Simon Newcomb and Grover Cleveland were elected to the Hall of Fame in the 8th quinquennial election. The opportunity comes very infrequently and only to a few of this great honor. Elections are held every five years and the opportunity to place some one in nomination who is worthy will not come again until 1940. The fact that the 11th edition of the Pharmacopœia will soon be completed brings to mind the valuable services rendered by Dr Lyman Spalding. The service which the Pharmacopœia renders is outstanding and preparations should be made to have the founder recognized in the Hall of Fame. While there is absolutely no criticism relative to the high standing of the nominees it is to be noted that President Cleveland is the only one of the three elected who was born in the United States.

Dr Lyman Spalding has a long American lineage, a splendid record as an educator and scientist and rendered a service whereby every one benefits. Steps should be taken to pay honor and tribute to the founder of the UNITED STATES PHARMACOPŒIA in the next election to the Hall of Fame.

2215 Constitution Ave WASHINGTON, D C

THE NEW PHARMACOPŒIA

THE Eleventh Revision of the United States Pharmacopœia was released for national distribution on December 16, 1935, and will become official on June 1, 1936. It is approximately ten years since the U S P X, which it supersedes, was similarly released (August 15, 1925) and about one hundred and fifteen years since the First Edition of the United States Pharmacopœia was presented to the medical and pharmaceutical professions by Dr Lyman Spalding. It is proper that we should pause at this time to honor Dr Spalding. He was a pioneer in the profession he represented, being among the first in this Country to advocate the use of smallpox vaccine. He was an unselfish, wise and skilful leader of men, his vision was nation-wide and his culture and professional skill were reflected in the United States Pharmacopœia of 1820.

It is remarkable that the underlying principles which he developed and incorporated in the Pharmacopœia of 1820 are to-day the fundamental policies of the Pharmacopœia of 1936 and only in the degree to which they have been realized is the new Revision to merit approval.

On the first page of the Preface of the U S P 1820, Dr Spalding wrote "It is the object of a Pharmacopœia to select from among substances which possess medicinal power, those, the utility of which is most fully established and best understood."

In the next paragraph he wrote "The value of a Pharmacopœia depends upon the fidelity with which it conforms to the best state of medical knowledge of the day."

It has been the earnest purpose of the sub-committees of the U S P XI to accomplish exactly this objective, that the Pharmacopœia of to-day might recognize, standardize and provide official titles for the important and approved medicines of 1936. In addition, the National Formulary has been developed to provide formulas and standards for many important preparations. These should reach every therapeutic need of the modern physician.

In one of the letters issued by Dr Spalding to his colleagues in 1818, urging their participation in the development of a National Pharmacopœia, his appeal was for "Gentlemen willing to act, and men distinguished for their ability and learning." This phrase of his is destined to become classic and is the basic factor if so gigantic a task is to be accomplished with honor and credit.

A review of the long list of those distinguished men of the professions of medicine and pharmacy and of the underlying sciences supporting these professions, will evidence the fact that in the past and also in our generation this standard of excellence has been maintained by those who have carried the burden of Pharmacopœial revision.

The members of both professions believe in these standards for the Pharmacopœia, which are our rich inheritances from the past, and are determined that they shall be maintained in the future.

There are to-day many splendid pharmacists and scientific workers in this field who are conducting researches and contributing their support to the per-

fection of official medicines that the quality of the book may be improved. Their names and activities are being carefully compiled for those who are interested in the future revisions of the Pharmacopœia.—E. FULLERTON COOK

THE NEW NATIONAL FORMULARY

THE National Formulary, Sixth Edition, was released for National distribution on December 16, 1935, and will become official June 1, 1936. It marks a distinct advance in this country in standardization of medicinal agents and in the contributions of pharmacy to public health.

Fifty years ago, at the Pittsburgh meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION, Charles Rice, as chairman of a committee, presented a proposition for a "National Formulary of Unofficial Preparations" under the auspices of the AMERICAN PHARMACEUTICAL ASSOCIATION. The first edition was published in 1888 under the foregoing title, the second edition was published in 1896, under the chairmanship of C. Lewis Diehl, who continued as chairman of the two succeeding revisions, and the Fifth Edition was published in 1926 under the chairmanship of W. L. Scoville. The history of the National Formulary is included in the text of N. F. VI, together with the "General Principles" followed in the latter edition, Edmund N. Gathercoal, chairman.

The following quotations are from pages 492-499 of the Sixth Edition and indicate the broad scope of revision. "The Chairman of the Committee of Revision of the United States Pharmacopœia was made an associate member of the N. F. Revision Committee. The National Dental Association appointed a special associate committee of its members for the consideration of dental formulas, and an associate committee was appointed by the American Veterinary Medical Association for the consideration of veterinary formulas. Thus were established direct contacts with these associations. An associate committee was also appointed by the American Pediatric Society." Officials of the Food and Drug Administration, U. S. Department of Agriculture and several State food and drugs departments gave valuable suggestions and advice.

The outstanding features of the Sixth Edition are summarized.

1. The admission of monographs for drugs and chemicals which are not included in U. S. P. XI or in the N. F. VI.

2. The admission of items on the basis of a definite extent of use in medical practice in the United States.

Four surveys were undertaken. In a survey of 1930, carefully prepared check-lists on the extent of use of preparations of N. F. V were returned by 213 prescription pharmacies, 75 hospital pharmacies and 625 drug stores, representing nearly every state in the Union. A similar survey determined the use of a large list of unofficial preparations and a Maryland survey accounted for the number of prescriptions filled annually, showing two prescriptions per inhabitant.

The "Prescription Ingredient Survey" is based on a total of 121,924 prescriptions, the ingredients of which were listed and read by expert pharmacists in New York, Maryland, Missouri and California. On this extensive study it was decided that items to be admitted to the National Formulary must be used in at least 20 per cent of the drug stores in the United States or must be an ingredient in at least

one of each 10,000 prescriptions compounded in the United States. It is thus evident that the recognition of N. F. materia medica is based on the needs of the physicians.

3 Formulas were omitted from many monographs of simple preparations, such as extracts, fluidextracts, ampuls, tablets, etc. Ample directions in detail are included to guide in the manufacture of larger or smaller quantities of the preparation.

4 Extensive developments of ampul and tablet monographs and the section of materials and preparations for diagnostic use are of interest. The Combined Contact Committee of the American Drug Manufacturers' Association and the American Pharmaceutical Manufacturers' Association has rendered helpful services in the ampul and tablet monographs, the tolerance statements and assay processes.

5 A forward step is evidenced by the admission of glandular powders and histological description of them, for their excellence, credit is given to the subcommittee and particularly to Dr. H. W. Youngken for the histological descriptions, which insure adequate means for the determination of their identity and purity.

6 Attention is called to the development and use of many additional assays of the chemical, proximate and biological types. The monographs are arranged alphabetically.

National Formulary VI contains 481 preparations' monographs, and 208 monographs on drugs and chemicals, 232 are new to this edition, 84 are items from U. S. P. X, the total number of monographs not admitted from N. F. V is 321—of these 246 are monographs of preparations and 75 are monographs of drugs and chemicals.

The last paragraph of the "History of the National Formulary" is quoted in full in closing the brief résumé of the new National Formulary, in which pharmacists may have pride, the medical professions will recognize the work as an essential contribution to their practice, and the Federal and State departments concerned with public health matters, food, drug and narcotic regulations, will value it as a necessary and very helpful service.

"During this period (1888-1935) fluidglycerates, glycerogelatins, mulls, and wines have had their day and have been replaced. Formulas for preparations have steadily decreased in the Pharmacopœia, and a diminishing demand is indicated in the National Formulary. Biological products have replaced some of the old drugs and remedies. The National Formulary now functions under very different conditions and purposes from those which it faced in its beginning."

The chairmen and members of the committees have rendered distinctive services, representing achievement and accomplishment.

ADDICTION LIABILITY OF CODEINE

Seven men addicted to morphine were stabilized on four daily hypodermic injections of 0.05 to 0.15 Gm. of morphine sulphate over a period of from ten to thirty days. This stability was maintained when codeine was substituted gradually over three days and entirely over the subsequent eight to fourteen days. The average effective substitution dose of codeine was five times that of morphine.

After the period of stabilization of codeine the administration was abruptly and completely stopped. The effects of abstinence differed only in the delay of their onset from the results of abrupt morphine deprivation. The subjects were aware of the substitution and asked for the substituted product after its withdrawal. The author concludes that codeine possesses definite addiction liability.—C. K. HUMPHREYS BACH (*J. A. M. A.* 103, 1420).

OBSERVATIONS ON THE OPIUM ASSAY *

BY JOSEPH ROSIN AND C J WILLIAMS ¹

Opium is assayed in most of the Pharmacopœias by either the Helfenberger or by the Lime method. Among the Pharmacopœias using the Helfenberger method or some modification of it are the Austrian, Belgium and German. The British, French (Codex), The Netherlands, Danish and Swiss use the Lime method. The United States Pharmacopœia also uses the Lime assay method with some modification. The Lime assay seems to be the more favored. Some of the Pharmacopœias recently revised have changed from the Helfenberger to the Lime assay method.

Helfenberger Method—A weighed quantity of the opium is triturated with water, then made up to a definite weight with water, and after standing for 30 minutes and mixing, it is filtered. To an aliquot portion of the filtrate, generally corresponding to about two thirds of the original opium 1 or 2 cc of normal ammonia water is added with gentle mixing and the mixture filtered immediately. This treatment with ammonia precipitates the other alkaloids such as narcotine, papaverine, etc. To an aliquot portion of the second filtrate 2 or 2.5 cc of normal ammonia water is again added and shaken for 10 minutes, which precipitates the morphine. It is then shaken with ether or ethyl acetate, filtered, washed and the morphine weighed or titrated.

Lime Method—A weighed quantity of the opium is triturated with water and slaked lime, then made up to definite weight or volume with water mixed well and filtered. To an aliquot portion of the filtrate, generally corresponding to one half or two-thirds of the original opium taken, ether and a small quantity of alcohol are added, followed by 1 or 2 Gm of ammonium chloride, the addition of the ammonium chloride causing the liberation of the morphine from its combination with lime. After mixing, the mixture is allowed to stand over night. It is then filtered, washed and the morphine titrated.

The United States Pharmacopœia assay of opium differs from the other Lime assay methods in that the opium is first completely extracted with water, thus eliminating the use of an aliquot portion with the attendant uncertainties that may be occasioned by the variation in the proportions of water and insoluble matter in the opium.

Criticisms of an opposite character have been frequently leveled against the Lime method. On the one hand it is maintained by some investigators that it yields too high results, claiming that the precipitated morphine is contaminated with co-precipitated titratable lime compounds, others assert that the results obtained by the Lime assay are too low because no account is taken of the morphine lost in the assay process due to solubility of the morphine in the solvents used in the assay. The latter criticism of the Lime method appears to have been the more prevalent, and has been met by some of the Pharmacopœias using the Lime method by applying a "correction" frequently designated as "solubility correction." The

* Scientific Section, A Ph A, Portland meeting 1935

¹ Merck & Co, Inc, Rahway, N J

correction ranges from 1 to 1.1 mg for each cc of lime-morphine solution used in the assay, and amounts to from 1 to 1.1% on the Opium, or to about 8% of the morphine present in the average opium. A comparison of results obtained in the assay of opium with the British Pharmacopœia—a lime assay applying a correction, with the United States Pharmacopœia assay—a lime assay but without a correction and with the German Pharmacopœia assay which typifies the Helfenberger method, is illustrated in the following tabulation.

TABLE I—ASSAY OF OPIUM BY B. P., U. S. P. AND Ph. G. VI METHODS

	B. P. % Anhydrous Morphine	U. S. P. % Anhydrous Morphine	Ph. G. VI % Anhydrous Morphine
Opium (partially dried)	16.38	15.55 15.61 15.58 Av.	15.08 15.22 15.15 Av.
Opium	13.76	13.09 12.90 13.00 Av.	12.12 12.29 12.21 Av.
Opium powder	10.71	9.77 9.91 9.84 Av.	9.08 8.91 9.00 Av.
Opium granular	10.39	9.73	8.94
Opium		15.24	14.75

The Helfenberger method it will be noted, gives the lowest indications, also, the differences between this method and the other two methods is greatest with the lower testing opiums. This is probably due to the fact that with the lower testing opiums there is a larger excess of ammonia present in the first treatment with ammonia for the removal of the other alkaloids and, therefore, more morphine is precipitated at this stage than with the higher testing opium.

The difference between the United States Pharmacopœia and the British Pharmacopœia assay results is approximately 0.75%. It should, however, be noted that within the last couple years the assays of a number of lots of opium by the British Pharmacopœia method gave results only about 0.2% above the United States Pharmacopœia.

There is no question but that some morphine is held in solution by the solvents in the assay, but the basis for the magnitude of the correction was somewhat obscure, at least to us. It is very much larger than could be accounted for by the solubility of morphine in the solvents. An endeavor to find the basis for the magnitude of the correction and to account for it resulted in the work recorded below.

EXPERIMENTS WITH MORPHINE

The morphine used for the experiments was recrystallized twice from hot methanol and was in the form of well-defined, relatively large crystals. By titration it showed a purity of 99.93% as hydrated morphine. It was also free from non-phenolic alkaloids. The same morphine was used for all the subsequent experiments.

U. S. P. Assay—1.050 Gm. of the morphine was dissolved in water and a slight excess of normal hydrochloric acid the solution made up with water to 30 cc. and then assayed according

to the U S P In a few of the tests the morphine was dissolved in meconic acid instead of hydrochloric acid

B P Assay—1.200 Gm of the morphine was dissolved in water and a slight excess of normal hydrochloric acid, treated with lime and made up to 90 Gm, 52 cc of the filtered solution was then assayed according to directions of the B P

The results are shown in Table II

In all the subsequent experiments with the U S P or B P assay, the quantities of morphine just indicated were used

TABLE II—SERIES A—U S P X METHOD

Per Cent Morphine Recovered		
98.2	94.4	97.5
97.4	96.9	96.3
97.6	94.5	95.8
97.9	94.4	
Average 96.44%		
Average "loss" of anhydrous morphine per assay		17.6 mg
Average "loss" of anhydrous morphine per cc of morphine-lime solution		0.58 mg

TABLE III—SERIES B—B P METHOD

Per Cent Morphine Recovered	
Uncorrected	Corrected
94.4	103.1
93.6	102.3
94.6	103.3
93.8	102.5
95.0	103.7
94.3 Av	103.0 Av
Average "loss" of anhydrous morphine per assay	37.6 mg
Average "loss" of anhydrous morphine per cc	0.72 mg

(Three analysts participated in Series A, and two in Series B, C, D)

Several of the assays in Series A are obviously too high. They are higher than would be expected even on the basis of only the theoretical solubility of morphine in the assay solvents. We attributed these high results to inclusion of titratable lime compounds with the precipitated morphine. The difference between the lowest and the highest results corresponds to only 2 mg of calcium oxide or its equivalent of other titratable lime compounds.

Average "loss" of anhydrous morphine per assay	49.8 mg
Average "loss" of anhydrous morphine per cc of morphine-lime solution	0.96 mg

To eliminate interference from lime we ran another series of assays of the morphine by the U S P and B P tests, but dissolved the precipitated morphine from off the filter with several portions of hot neutral methanol. To the methanol

solutions of the morphine a measured volume of tenth-normal sulphuric acid was added, then the solution diluted with about 2-3 volumes cold water, allowed to cool and the excess acid titrated with tenth-normal sodium hydroxide, using methyl red as the indicator. In some of the assays, where a larger volume of methanol had to be used, the greater part of it was evaporated off after dilution with water. In methanol-water solution the morphine titrated 99.93 and 100.10%.

The results of Series C and D, and especially C, are more concordant among themselves than in the corresponding Series A and B. It will also be noted that by dissolving in hot methanol the yields by both the U S P and B P assays are about 2% lower than when the morphine is directly dissolved in standard acid.

Series C and D practically substantiate the validity of the correction of 1 mg per cc of morphine-lime solution. The question now was how to account for the large correction.

NOTE In all the assays of morphine from here on where lime was used the precipitated morphine was dissolved in hot methanol.

When an excess of the finely powdered morphine was shaken with water, alcohol and ether, in the proportions of the U S P assay for opium, 30 cc of the filtered aqueous layer gave upon evaporation 10 mg of anhydrous morphine. From 15 cc of the ether about 1.5 mg of morphine was obtained on evaporation.

Portions of 0.50 Gm of the morphine were dissolved in 30 cc of water with a slight excess of normal hydrochloric or meconic acid, 3.5 to 4 cc of normal ammonia added and allowed to stand over night. This quantity of ammonia gives approximately the same excess of alkalinity as in the U S P assay. The precipitated morphine, after filtering and washing with ice-cold water, was dissolved in tenth-normal H_2SO_4 and back titrated with 0.1N NaOH. The recoveries of morphine were 98.2, 97.7 and 98.0 per cent. Repeating the experiments in presence of 2 cc alcohol and 15 cc ether, as in the U S P opium assay, 96.7, 97.2 and 97.0 per cent of the morphine were precipitated. These recoveries correspond to a loss of about 14 mg of anhydrous morphine, leaving about an equal quantity of additional loss when assayed by the U S P method to be accounted for.

Adsorption of morphine on the lime suggested itself as a likely cause for the increased loss. If this assumption were valid, less morphine should be adsorbed if less lime is used and vice versa. We accordingly made one assay of the morphine by the U S P method, but using 2 Gm of lime instead of 4 Gm, and one assay by the B P method, but using 4 Gm of lime instead of 2 Gm. In the former, there was about 1% increase in the quantity of precipitated morphine, in the latter an additional loss of about 1.5% was sustained. These results do seem to indicate adsorption of some morphine on the lime, but not sufficient to account for all the loss in excess of the normal solubility in the assay solvents. Moreover, the loss per cc of lime-morphine solution, as shown in Tables IV and V, is the same for the U S P and B P assay methods, notwithstanding the different quantities of lime used.

Many alkaloids are known to react with ammonium salts on heating, the alkaloid being converted into the salt of the anion of the ammonium salt used and ammonia liberated. We found that with morphine the same reaction takes place in an aqueous solution of ammonium chloride at room temperature. It was shown

before that practically 98% of the morphine was precipitated from its solution by ammonia. When the same experiments were made in the presence of 0.5 Gm. and 1 Gm. of ammonium chloride, the precipitation amounted to 96.4 and 95.3 per cent, respectively. When, in addition to the ammonium chloride, the precipitation was made in the presence of alcohol and ether in the proportions of the U. S. P. assay, the corresponding recoveries were 96.0 and 94.9 per cent. A summation of the foregoing results is presented in Table VI.

TABLE VI

	Per Cent Morphine Recovered by Precipitation
1. Aqueous solution precipitated with ammonia	98.0
2. Ditto, in presence of 0.5 Gm. ammonium chloride	96.4
3. Ditto, in presence of 1 Gm. ammonium chloride	95.3
4. As 1, but in presence of 2 cc. alcohol and 15 cc. ether	97.0
5. Ditto 4, but with 0.5 Gm. ammonium chloride	96.0
6. Ditto 4, but with 1 Gm. Ammonium chloride	94.9

The effect of ammonium chloride on the amount of morphine precipitated was corroborated by assaying the morphine by the U. S. P. method, but using 0.5 Gm. of ammonium chloride instead of 1 Gm. The following table illustrates the results.

TABLE VII

1 Gm. NH_4Cl	0.5 Gm. NH_4Cl
93.6	95.3
94.2	95.0
93.8	95.1
93.9 Av	95.1 Av

The foregoing data clearly indicate that the ammonium chloride is responsible for holding in solution about 2%, or at least about 10 mg., of morphine in the U. S. P. assay. They also disclose that 0.5 Gm. of ammonium chloride is ample for the precipitation of the morphine from the lime solution, and that with this quantity of ammonium chloride an increased precipitation of the morphine amounting to 1% or over, is obtainable. As a matter of fact, the Netherlands Pharmacopoeia uses 0.2 Gm. ammonium chloride for 2 Gm. of opium, which corresponds to 0.4 Gm. NH_4Cl for 4 Gm. of opium in the U. S. P. assay.

Ammonium sulphate exerts a much smaller solvent effect than ammonium chloride. For instance, when 0.5 Gm. of morphine was dissolved in 30 cc. water with just sufficient sulphuric acid, 2 cc. alcohol and 1 Gm. of ammonium sulphate added and precipitated with 3.5 cc. of normal ammonia, 97.4% of the morphine was recovered.

The aqueous layers, exclusive of the washing, from several of the assays in Series C and D, as well as in similar experiments not reported here, were nearly saturated with sodium chloride and extracted with 4 to 6, 25-cc. portions of chloroform—alcohol mixture. The extract, after washing with a small quantity of water, was evaporated, the residue dissolved by warming with fiftieth-normal acid and the excess acid titrated with fiftieth-normal sodium hydroxide. From the mother liquor of the U. S. P. assays the alkaloid recovered ranged from 9 to 14 mg. with an average of 12 mg. corresponding to about 40% of the morphine "lost" in the assay.

From the B P assays the recovery ranged from 17 to 22 mg, also corresponding to about 40% of the unprecipitated morphine. From the aqueous mother liquors of the experiments summarized in Table VI, 80 to 85 per cent of the morphine held "in solution" was recovered, giving a total recovery of about 99%. We are unable yet to account for this phenomenon. The only difference between the two is the presence of some calcium chloride or possibly even some calcium hydroxide in the U S P or B P assays.

On several occasions when the same assay of the morphine was repeated but at a different time, the results were more divergent than could be accounted for by the average error, notwithstanding that the errors in assaying pure morphine are to be expected to be greater than in many other types of quantitative determinations. It was suspected that the difference may be due to the difference in temperatures prevailing during the precipitation of morphine over night. The suspicion was corroborated, as shown in the following table, by running two sets of assays by the U S P method. In one set the precipitation was allowed to take place at room temperature—about 28° C, and in the other at about 8° C.

TABLE VIII—RESULTS SHOWING THE EFFECT OF TEMPERATURE ON RECOVERY OF MORPHINE

Temperature during Precipitation about 28° C	Per Cent Morphine Recovered	Temperature during Precipitation about 8° C
93.6%		95.7%
94.5		95.5
93.4		95.8
<hr/>		<hr/>
93.8 Av		95.7 Av

In average laboratories such variations in temperature do not, of course, obtain, but a 10° difference between the winter and summer is not at all uncommon, and the same assay made at 20° and 30° C may show a variation of about 1%.

We believe that the markedly lower recoveries at the higher temperature is primarily due to the greater solubility exerted by the ammonium chloride at that temperature.

It has been indicated in the literature that in the assay of opium, and especially so by the lime method, small quantities of other alkaloids, notably codeine, are co-precipitated with the morphine. We have found this to be the case in a number of samples of opium we examined. The results are recorded later on. The effect of the presence of other alkaloids on the precipitation of pure morphine was determined by assaying a "composition opium" by the U S P method, after dissolving it in either hydrochloric or meconic acid. The "composition opium" for each assay was made up of 1.050 Gm of morphine, about 0.4 Gm of nareotine, 0.1 Gm of codeine, about 0.08 Gm papaverine, 0.07 Gm of thebaine and about 0.2 Gm of morphine free tar obtained in the process of manufacture of morphine. The proportions of the other alkaloids corresponds, approximately, to those present in average opium.

The results are on the average about 1% higher than those obtained with morphine alone (compare Table IV).

Morphine, like most other alkaloids, is "salted" out by sodium chloride or sulphate. If in the assay of morphine, in the form of hydrochloride or meconate,

TABLE IX—SERIES E—"COMPOSITION
OPIMUM" ASSAYED BY U S P X
METHOD

Per Cent Morphine Recovered	
95.6	95.6
94.8	95.8
95.2	95.4
Average 95.4	

by the U S P method the morphine-lime solution is saturated with sodium chloride before precipitation with ammonium chloride, the amount of morphine precipitated is about 1.5% higher than without sodium chloride. We also observed, however, that saturation with sodium chloride in the assay of "Composition opium" also precipitates a somewhat greater proportion of the by-alkaloids.

EXPERIMENTS WITH OPIMUM

Effect of Methanol—Several samples of opium were assayed by the U S P method and also by the modification of dissolving the precipitated morphine in hot methanol, etc., as described under pure morphine. The results were as follows:

TABLE X—EFFECT OF DISSOLVING THE PRECIPITATED MORPHINE IN METHANOL

	Per Cent Anhydrous Morphine U S P Assay Not Dissolved in Methanol	U S P Assay Dissolved in Methanol
Opium No. 7	15.07	14.74
Opium No. 8	12.83	12.58
Opium No. 21	12.04	11.80

On the basis of the morphine contents the difference is about 2%, practically the same as obtained with morphine.

Effect of Ammonium Chloride—The effect of using only 0.5 Gm. of ammonium chloride in the assay of opium instead of 1 Gm. is shown in the following tabulation. In both sets of assay the precipitated morphine was dissolved in methanol.

TABLE XI—PER CENT MORPHINE FOUND

	1 Gm. of Ammonium Chloride	0.5 Gm. of Ammonium Chloride
Opium No. 7	14.82	15.05
Opium No. 8	12.63	12.96
Opium No. 21	12.08	12.21

Effect of Temperature—The effect of the temperature on the amount of morphine precipitated in assaying opium practically confirmed the results found with morphine. Two samples of opium precipitated at a temperature of 28–30° C. gave 15.25 and 11.85% but when the precipitation was made at about 8° C. the percentages of morphine were 15.35 and 12.03%.

Co-precipitated Alkaloids—In the experiments with "composition opium" described under morphine, an increased yield of about 1%, due to the precipitation of by-alkaloids, was obtained. The by-alkaloids co-precipitated with morphine in the opium assay is considerably greater. For the determination of the co-precipitated alkaloids, the morphine solution, after titration, was treated with 10 cc. of 5% sodium hydroxide and shaken out with several portions of chloroform. The combined chloroform extracts were shaken with small quantities of water to remove any free alkali, filtered and evaporated nearly to dryness. A measured volume of fiftieth normal sulphuric acid was added, warmed until the residue was dissolved and the odor of chloroform dissipated, cooled and then the excess of acid titrated with fiftieth normal sodium hydroxide using

methyl red as the indicator The percentages of other alkaloids thus found, calculated as morphine, are shown in the following table

TABLE XII—OPIUM BY ALKALOIDS CO PRECIPITATED WITH THE MORPHINE

	Per Cent Anhydrous Morphine U S I Assay	Per Cent Non phenolic Alkaloids Co precipitated with the Morphine	Per Cent Non phenolic Alkaloids on the Basis of the Morphine
Opium No 11	15 20	0 45	2 96
Opium No 12	12 42	0 34	2 74
Opium No 12 A	14 76	0 53	3 59
Opium No 13	15 06	0 45	2 99
Opium No 16	14 64	0 39	2 67
Opium No 18	12 58	0 35	2 78
		0 42 Av	2 96 Av

These determinations represent only the non-phenolic by-alkaloids Opium contains also several phenolic alkaloids other than morphine If they should be present in appreciable quantities they will probably be co precipitated with the morphine, and the extraction of the sodium hydroxide solution of the alkaloids with chloroform would not eliminate them

Shaking out of the aqueous mother liquor from several of the opium assays with chloroform-alcohol, after saturation with sodium chloride, yielded from 8 to 13 mg of morphine, with an average of 11 mg This recovery is practically identical with that obtained from the aqueous mother liquor in the assays of morphine

Within the last two or three years a new type of assay for opium has been advanced, the essential features of it being the following The aqueous or acid extract of the opium is treated with an excess of sodium hydroxide solution and shaken out with an immiscible solvent such as chloroform Non-phenolic alkaloids are thus removed The alkaline solution holding the morphine is acidified with HCl, then made alkaline with ammonia and shaken out with a suitable solvent The second shaking out extracts the morphine which after evaporation of the solvent is titrated

An assay of this type, which we would designate as "Assay by immiscible solvents" is due to Buchbinder, formerly of the Bureau of Chemistry He uses chloroform-alcohol for the extraction of the morphine from the ammoniacal solution Assaying morphine, in hydrochloric acid solution, by the Buchbinder method we recovered 98.4 and 97.1% We also assayed four samples of opium by the same method The results compared with those obtained by the regular U S P method were as follows

TABLE XIII

	U S P Method	Buchbinder Method
Opium No 53	11 93	12 15
Opium No 65	14 20	14 51
Opium No 69	13 62	13 90
Opium granular	10 50	11 01

The Buchbinder method gives a slightly higher test than the U S P method This may be due to the fact that in the Buchbinder method an aliquot portion is taken from a solution in which there is present the insoluble matter from the opium, barium sulphate derived from barium chloride used in the assay, etc

Another "assay by immiscible solvents" has been proposed by Eder and Stucki. They digest the opium first with normal hydrochloric acid, claiming that the acid liberates more morphine, and use a mixture of chloroform and isopropanol for both removing the non-phenolic alkaloids as well as for the extraction of the morphine.

The "assays by immiscible solvents" have, *first*, the important advantage that no correction for solubility of morphine is necessary, and *second*, the isolated morphine is not contaminated with non-phenolic alkaloids, although other phenolic alkaloids may be included as morphine. These assays have, however, one great disadvantage. On account of the limited solubility of morphine in the solvents only a small quantity of opium, 1 or 2 Gm., can be used for the assay. Such a small sample could not be well representative of the opium, especially when dealing with Gum Opium. We believe, however, that the above proposed assays for opium by immiscible solvents have laid the ground work for further investigation which we hope will result in perfecting the method and making it of practical use.

SUMMARY

Dissolving the morphine, obtained in the lime assays, in hot methanol before titration eliminates, on the basis of the morphine contents, about 2% of foreign titratable substances calculated as morphine.

Assays of pure morphine by the U S P and B P methods confirm the "assay-loss" of practically 1 mg. of morphine for each cc. of lime-morphine solution as indicated in the latter Pharmacopœia. This "loss," however, will fluctuate somewhat unless definite and uniform conditions are maintained in the assay.

About one-half of the assay loss is attributable to the solubility of morphine in the assay solvents. The greater part, if not all, of the balance of the "loss" is caused by the solvent action of the ammonium chloride on morphine. Adsorption on the lime may also be responsible for a small portion of the assay-loss.

It therefore follows, and it has been confirmed by experiment, that the larger the quantity of ammonium chloride used the greater will be the quantity of morphine dissolved. By using 0.5 Gm. of ammonium chloride in the U S P assay, 1 to 1.5 per cent more morphine was precipitated than when 1 Gm. was used.

The temperature during precipitation of the morphine in the lime assays affects the quantity of morphine held in solution. When precipitation takes place at 28°-30° C. about 2% more of the morphine is dissolved than at 8° C. We attribute the increased solubility largely to the greater solvent action of the ammonium chloride at the higher temperature.

It is recommended (1) that in the U S P assay 0.5 Gm. of ammonium chloride be used instead of 1 Gm. This quantity, 0.5 Gm., is several times the theory for a 15% opium, and (2) that the temperature of precipitation (standing over night) be restricted to about 10° C.

Saturation or near-saturation of the lime-morphine solution with sodium chloride before adding the ammonium chloride raises 1 to 2 per cent the quantity of the morphine precipitated. In the case of opium, however, the use of sodium chloride will also increase the co-precipitation of the by-alkaloids.

The morphine precipitated in the U S P and probably also in other lime assays carries about 3% non-phenolic by-alkaloids which is included in the assay as

morphine Since opium contains also other alkali-soluble alkaloids than morphine, these, if present in appreciable quantities, may also be included with the morphine and thus show an apparent higher morphine content Pharmacopœias applying a correction for "assay-loss" should, as a matter of scientific accuracy and of fairness to the manufacturers of morphine and its derivatives, who consume 90% or more of the total legitimately used opium, take cognizance of the occlusion of by-alkaloids in the morphine and make the necessary correction

By coincidence of counterbalancing error factors, the U S P assay of opium appears to indicate very closely the true morphine content

The "total extraction" of the opium which has been practiced in the assay by the several revisions of the U S P is an important point in its favor It obviates errors in aliquot portions due to the variable amounts of water and insoluble matter in the opium In the assay method under consideration by the Committee of the League of Nations, published elsewhere, these sources of "inaccuracies" are corrected for by making separate determinations of the water content of the opium, and of the total extractive matter

Corrections, almost of any kind, are looked upon with disfavor in analytical procedures They are most uncertain and most undesirable when the corrections involved are of appreciable magnitude

Assays based on the isolation of the morphine, free from by-alkaloids, through the use of immiscible solvents offer a possible solution of the problem provided they can be worked with reasonably large samples They should also strive to avoid such aliquots as may introduce any element of error, and, *ipso facto*, should not require an undue length of time

GELATIN AS A STABILIZING COLLOID FOR OIL IN WATER EMULSION SYSTEMS *

BY LINWOOD F TICE ¹

Various workers have investigated the efficiency of gelatin as an emulsifying agent Briggs and Schmidt (1) found gelatin to be comparatively inefficient as an emulsifying agent Clayton (2) reported drop numbers for cottonseed and peanut oils in aqueous gelatin solutions which indicated that gelatin possessed considerable ability to reduce the interfacial tension between oil and water Holmes and Child (3) studied the effect of added electrolytes upon the emulsion system kerosene, gelatin and water and concluded that the important factor was the conferring of a favorable viscosity to the gelatin solution Kernot and Knaggs (4) using the Donnan pipette measured the drop numbers of various oils against gelatin solutions Limburg (5) showed that a lowered p_H favors the adsorption of gelatin around oil globules

In reviewing the results of these workers it is very difficult for one to reach any definite conclusions as to the exact status of gelatin as a practical emulsifying agent The following criticism may be advanced concerning these results

* Scientific Section, A P H A, Portland meeting, 1935

¹ Department of Research Philadelphia College of Pharmacy and Science Investigation conducted in behalf of the Edible Gelatin Manufacturers' Research Society of America Inc

I The use of the drop number of an oil against some solution, although of considerable indicative value, cannot be taken as conclusive evidence in regard to the emulsion stabilizing ability of such a solution

II In no case was really effective emulsification of commonly used oils, *e g*, cod liver oil, heavy mineral oil, etc., actually accomplished. Such emulsions as were produced were of theoretical interest but they possessed no practical value.

III Such inefficient methods of dispersion were employed that there exists considerable doubt as to the real meaning of the results.

It must be realized that a substance may be an excellent stabilizer in an emulsion system, effectively reducing the interfacial tension between the two phases, but at the same time due to its physical properties it may not favor the easy dispersion of the phase to be dispersed. Consequently, using crude methods of dispersion one is apt to obtain misleading results as to the true stabilizing power of an emulsifying agent.

When a highly efficient device which insures an initially highly disperse emulsion is employed then the real ability of a substance to stabilize the system can be determined.

The object of this investigation was to determine the efficiency of gelatin as an emulsion stabilizing colloid, the specifications under which it is most effective for such use, and lastly, if possible, to submit practical working formulas in which gelatin might be employed as the emulsifying agent.

COLLECTION OF MATERIALS

Samples of every type and grade of gelatin were obtained from several of the largest manufacturers of this product. All the data concerning the method of manufacture and the control reports were submitted with each sample.

The next step was the investigation of emulsifying devices in order to obtain the most efficient unit available. The importance of such an investigation has already been explained, namely, to eliminate all possibility of misleading results due to inefficient mechanical treatment.

Several colloid mills were examined and the degree of dispersion accomplished by each noted. Then a laboratory homogenizer manufactured by Manton-Gaulin was studied. The results were as follows. Among the colloid mills there is a wide difference in their relative efficiencies. The homogenizer, however, for liquid emulsions provided the best degree of dispersion and the greatest uniformity of product. It is true that colloid mills are not as cumbersome and are more generally applicable for other uses than the homogenizer, but for liquid emulsions they did not prove as satisfactory.

Furthermore, gelatin being strongly adsorbed and probably preferentially so at a water/air interface, the homogenizer which almost entirely excludes air was thought to be more satisfactory for the preparation of emulsions containing gelatin.

Having now decided upon the method of dispersion to be used and having available every possible type of gelatin, the actual experimental work was begun.

EXPERIMENTAL PART

The experimental method chosen was the preparation of emulsions of heavy liquid petrolatum containing in each case 50 per cent of oil, the dispersion medium

Oil globules dispersed in water have been shown to be negatively charged which is as would be expected inasmuch as the dielectric constant of oil is lower than that of water

Therefore, in order to encourage the adsorption of gelatin at an oil/water interface the greater the charge the more readily should such adsorption take place

Starting with a gelatin from a linned precursor whose isoelectric point lies at 4.7 it will readily be seen that in order to confer on it highly positive properties a much lower p_H is needed than would be required by a gelatin from an acid-treated precursor having an isoelectric point at a p_H of 8. This seems to be a logical explanation of the superiority of porkskin gelatin in stabilizing an emulsion over bone or calfskin gelatin at the p_H of 3.

It was evident that if this reasoning were correct bone and calfskin gelatin at a still lower p_H , say approximately a p_H of 1, should make possible equally satisfactory emulsions as those given by porkskin gelatin at the higher p_H . This was definitely borne out experimentally.

Another difficulty using ordinary bone or calfskin gelatin is that, at ordinary p_H levels, if sufficient gelatin is used to provide the necessary concentration gelation of the product results. With porkskin gelatin this tendency is very much reduced, and at a p_H of 3 gelation of even 1% solutions is almost entirely prevented. The reason for this difference is explained by the fact that the degree of hydration of gelatin is proportional to the differential between its p_H and that at its isoelectric point. The degree of hydration of a porkskin gelatin at a p_H of 3 would consequently be expected to be considerably more than that present in a bone or calfskin gelatin at that same p_H .

Although emulsification is quite efficient at a p_H of 1 with bone and calfskin gelatin, for most purposes at least this p_H level contributes too great an acidity to the product and for emulsions to be taken internally the use of porkskin gelatin at a p_H of 3 is recommended.

Porkskin gelatin as sold upon the market has a p_H of 4.0-4.6. Consequently, an adjustment of the p_H level is necessary before it may be used in the preparation of such emulsions. In the above experiments such adjustments were made on the basis of a graph on which the ordinates were the cc. of tenth-normal hydrochloric acid added per 100 cc. of 1% gelatin and the abscissæ the resulting p_H levels. Between the extremes p_H 4.6 and p_H 3 the plotted points produced practically a straight line and it was found that with various lots of gelatin of the same type, knowing their initial p_H , it was possible within reasonable limits to calculate by proportion the required amount of acid that should be employed.

It was thought, however, that for the practical worker it would be much easier to adjust the p_H with tartaric acid. Tartaric acid being a quite pure and uniform crystalline substance, the addition could then be made on a weight basis. A graph was prepared in which the milligrams of tartaric acid added per 100 cc. of 1% gelatin was represented as the ordinates, the abscissæ being the observed p_H levels of such solutions. Such a graph is illustrated (Fig. 1).

Emulsions were made using the proper amount of tartaric acid to provide a p_H of 3. Such emulsions, however, seemed considerably more acid to the taste than similar emulsions made with gelatin whose p_H was adjusted with hydrochloric acid. The reason for this may be that some tartness lies in the undissociated

tartaric acid molecules, such tartness being an inherent property of these molecules to the taste. Fortunately, it was found that at a pH of 3.2, where only three-fifths as much tartaric acid was required, emulsification was satisfactory and the gelation tendency sufficiently depressed by the added liquefying effect of the tartrate that gelation did not occur. Consequently, if the pH is adjusted by the use of hydrochloric acid the level should be 3, if tartaric acid is used a level of 3.2 is most satisfactory.

Alcohol, in moderate amounts, sugar and glycerin were found to be compatible with gelatin in emulsion formulas. In fact, the last two seemed to actually exert a favorable influence on the resulting product.

Various samples of experimental emulsions were aged to determine their stability, others were placed in a refrigerator and a third lot were subjected to oven temperatures of approximately $45^{\circ}C$.

The result of several months' aging at room temperatures is a very slight creaming and a gradual loss in viscosity. The extent of creaming is considerably less than many comparable commercial emulsions. The gradual loss in viscosity was not unexpected as, under such conditions, a slow hydrolysis of the gelatin protein is of course unavoidable. The degree of dispersion and condition of emulsification remained excellent.

Those emulsions placed in the refrigerator became somewhat thick and viscous but no actual solidification took place. It was in some cases necessary to shake the bottle before pouring, due to the formation of a thin surface film which, however, was easily broken on shaking.

A very interesting phenomenon was observed with emulsions placed in the oven at $45^{\circ}C$. When such emulsions were made with hot gelatin solutions and subsequently cooled they were perfectly stable. On the other hand, when made with cold gelatin solutions the emulsions after being kept in the oven showed a slight separation of oil, which separation, however, was not continuous. There are two possible explanations seen for this—first, it may be that the sol \rightleftharpoons gel change due to change in temperature may cause a certain amount of dispersed oil to separate when made in the cold and then warmed, or secondly, the cold gelatin solution may, due to its greater viscosity, entrap air, this entrapped air at the same time enclosing oil globules. Upon heating, the air being expelled a certain small amount of un-

Fig 1

emulsified oil is liberated. This latter explanation seems the more probable of the two. At any rate, such a defect is overcome by using a hot gelatin solution in producing the emulsion.

Realizing that a slow hydrolysis of gelatin might in time entirely destroy its stabilizing influence, the following experiment was carried out. A 5% solution of gelatin at a p_H of 3 was heated at 100° C for 3 hours. At the end of this time it had lost all power of gelation and it was, when cold, quite limpid, yet it still quite effectively retained its power to stabilize an emulsion containing 50 per cent mineral oil. Of course, the hydrolysis had not yet completely formed the underlying aminoacids, although doubtlessly it was considerably progressed. This experiment gave good evidence that although hydrolysis would unavoidably lessen the viscosity it should not be expected to disrupt the emulsion system through total loss of stabilizing influence.

It may be mentioned here that loss in viscosity, although it accelerates slightly the rate of creaming, is not nearly as undesirable as an increase in viscosity upon aging. In the latter case, actual solidification may occur whereupon pouring may become impossible.

A comparison of relative efficiencies of low and high Bloom gelatins showed conclusively that the higher Bloom gelatins are to be preferred in emulsion work. Consequently, porkskin gelatin, for example, was selected having a Bloom rating of at least 250 Gm. No difficulty should be experienced in obtaining such a Bloom strength gelatin of the porkskin type, although with bone and calfskin gelatin a product of this high a Bloom rating is not usually marketed.

There are several advantages to be obtained by the use of gelatin as an emulsifying agent:

I It is an excellent stabilizer.

II It possesses unusual economy due to both its low cost and the small amount required. It was calculated that for one gallon of emulsion the cost of gelatin required would be less than three cents.

III For emulsions to be administered internally it greatly reduces the caloric intake as compared with acacia. Furthermore, being very easily digestible it is less disturbing in cases of gastro-intestinal disorders.

IV In technical emulsions it eliminates the presence of the, in many cases, undesirable gum and permits the preparation of highly fluid yet slightly acid emulsions.

The only possible disadvantages encountered are first, the necessity of a homogenizer, and second, the gradual loss in viscosity of the finished product.

The first disadvantage is meaningless on a large scale as most manufacturing organizations possess such equipment. On a small scale there are now available numerous quite inexpensive hand homogenizers (7) which make possible the use of gelatin, *e. g.*, by the prescription pharmacist.

It may be mentioned that the new United States Pharmacopœia has its text so worded that gelatin may be used in official emulsions replacing acacia.

PRACTICAL APPLICATIONS

Some formulas using gelatin as the sole emulsifying agent are presented in order to illustrate the practicability of its use.

A

I	{	Gelatin (0.6% porkskin 250 Bloom)	6.0	Gm
		Tartaric acid <i>or</i> (Hydrochloric acid <i>q s</i>)	0.450	Gm *
	{	Syrup	100.0	cc
		Water <i>q s</i>		
II	To make		440.0	cc
	{	Vanillin	0.035	Gm
		Alcohol	60.0	cc
III	Heavy mineral oil		500.0	cc
To make about			1000.0	cc

Add the gelatin and tartaric acid to about 300 cc of cold water, allow to stand a few minutes then heat until dissolved. Add the syrup and finally enough water to make 440 cc (I). While still quite warm add II, then III, and mix well avoiding the inclusion of air. Finally, homogenize and bottle. Homogenization should be repeated if necessary until all the oil is completely dispersed.

Such an emulsion conforms to the new U S P XI monograph for Emulsion of Liquid Petrolatum.

B

I	{	Gelatin (0.5% porkskin 250 Bloom)	50	Gm
		Tartaric acid <i>or</i> (Hydrochloric acid <i>q s</i>)	0.375	Gm *
		Methyl parahydroxy benzoate	20	Gm
		Water <i>q s</i>		
II	{	To make	500.0	cc
		"Lemon Oil"	250.0	cc
		Light mineral oil	250.0	cc
		To make about	1000.0	cc

The directions here are similar to those in "A". Methyl parahydroxy benzoate replaces the alcohol as a preservative. Such a formula provides an excellent furniture polish emulsion.

In preserving emulsions made with gelatin the only organisms that can develop at such a p_H are the molds and yeasts. All proteolytic bacteria are inactivated by the acidity. Consequently, the problem of preservation is no more complicated than that arising from the use of any carbohydrate emulsifier as, for example, acacia.

SUMMARY

I Gelatin is a very efficient stabilizing colloid for oil-in-water emulsion systems.

II The important factors to be considered in connection with gelatin for this purpose are first, the preliminary treatment received by its precursor (which determines its isoelectric point) and second, the p_H of the solution to be used.

III Gelatin from acid-treated precursors, having an isoelectric point at $p_H\ 8$, requires a p_H of approximately 3 to effectively stabilize an emulsion, whereas gelatin

* The amount of tartaric acid may vary slightly depending upon the gelatin used. If hydrochloric acid is used, the amount necessary to give a p_H of 3 must be determined by experiment. If a thinner emulsion is desired 5 Gm of gelatin may be used instead of 6 Gm.

from alkali-treated precursors, having an isoelectric point at p_H 4.7, requires a p_H of approximately 1

IV The advantages of gelatin for use in emulsions are enumerated

V The efficiency of several colloid mills as compared with that of a homogenizer in preparing liquid emulsions is reported

VI Practical formulas and directions for the use of gelatin in emulsions are presented

A NOTE ON THE ACTION OF ALKALIES AND ALKALI SALTS ON ANTIPYRINE *¹2

BY LOYD E. HARRIS AND ERCELL D. TEBOW

A prescription that called for a solution of antipyrine in a concentrated solution of potassium citrate was brought to the laboratory for an explanation. A colorless liquid separated which disappeared on dilution of the mixture with water. Or, on standing, it gradually changed to a crystalline substance. A search of the literature gave no information as to what was happening, so the problem was investigated in the laboratory.

EXPERIMENTAL

A few grams of the liquid precipitate were obtained by adding antipyrine to a saturated aqueous solution of potassium citrate. This was separated by using a separatory funnel. Crystals began forming after standing a few hours and in about 48 hours the mass was completely crystallized. The crystals resembled antipyrine in physical appearance and the melting point was found to be 111°C which is the same as the U. S. P. compound. A mixed melting point with antipyrine did not cause any change. The U. S. P. X color tests were positive, thus, further indicating that the crystals were antipyrine.

A saturated alcoholic solution of picric acid was added to a boiling aqueous solution of the immiscible liquid. Almost immediately, long yellow crystals began to appear. After washing with water and drying, their melting point was determined to be 188°C , antipyrine picrate was prepared in a similar manner and its melting point was the same.

A second portion of the aqueous solution of the immiscible liquid was made acid with hydrochloric acid (no change was apparent in the dilution used) and then sodium nitrite was added. The green precipitate, which formed, was separated by filtration, washed with water and then dried. The melting point was 200°C and corresponds to the melting point of nitroso antipyrine, prepared in the laboratory.

¹ An abstract from a Thesis submitted by Ercell Dale Tebow to the Graduate Faculty, University of Oklahoma, in partial fulfillment of the requirements for the degree of M. S. in Pharmacy, 1933

² From the Pharmacy Laboratory, School of Pharmacy, University of Oklahoma

Portions of the immiscible fluid obtained from each of the alkalies and alkali salts used were burned, in separate evaporating dishes at temperatures less than red heat. There was no ash or residue, except in one instance (this was probably due to incomplete separation of the liquids)

The liquid separated and came to the top when antipyrine was mixed with alkali salts, but with sodium hydroxide and potassium hydroxide, in a few instances, it settled to the bottom. This was apparently due to the different specific gravities: the specific gravity of the separated immiscible liquid was found to be 1.0965 at 25° C.

Crystals formed almost immediately when potassium hydroxide and sodium hydroxide were used, but with potassium citrate and sodium citrate the fluid would frequently remain liquid for several days.

The percentages of alkali and antipyrine were determined at which the immiscible liquid started to separate. In determining the sodium citrate, potassium citrate and antipyrine, the percentages were calculated from the amount of water used and not the total volume of the solution. Due to the hygroscopic nature of potassium hydroxide and sodium hydroxide they were weighed and dissolved in enough water to make a definite volume and the percentages calculated. Equal amounts of antipyrine were placed in test-tubes, a measured amount of water added and after it had dissolved the alkali or alkali salt solution was added from a second burette, shaking after each 0.2 cc., until separation was noticed. The percentage of each was then calculated from the total amount of liquid added. The results are presented in graph form.

Fig 1—Per cent I sodium hydroxide, II, potassium hydroxide, III sodium citrate, IV, potassium citrate

A number of other alkali salts were tested qualitatively to see if they would produce similar results on solutions of antipyrine. Each caused the separation into two immiscible layers. The salts used were sodium bicarbonate, sodium acetate, sodium carbonate, sodium thiosulphate, potassium bicarbonate, potassium carbonate, potassium acetate, ammonium acetate and ammonium carbonate.

CONCLUSIONS

From the foregoing facts, it is believed that the immiscible liquid obtained by the addition of antipyrine to concentrated solutions of alkalies or alkali salts is an isomeric form, which will change to the usual crystalline form on standing.

QUANTITATIVE ANALYSIS OF BARBITURIC ACID DERIVATIVES

BY KAZIMIERS KALINOWAKI, UNIV OF POZNAN

To a solution of 0.2–0.3 Gm. of the substance to be analyzed in 20–25 mls of acetone or 30–36 mls of ethyl alcohol, 15–20 mls of a normal

solution of NaOH and 20–30 mls of water are added. This clear solution is titrated with a 0.1N solution of AgNO_3 until a turbidity is obtained. As this method is simple and accurate to 0.1 per cent its use is adapted to pharmaceutical laboratories.—*The Pharmaceutical Journal* August 31 1935

PHYTOCHEMICAL NOTES

No 112 THE STEROLS OF *ACHILLEA MILLEFOLIUM* *

BY OLE GISVOLD

In the course of the chemical investigation of milfoil by Katherine Graham (1) a sterol melting at 134-135° had been isolated. Its acetate melted at 123-124°. However, the melting points were not very sharp. A study of the original literature on sterols seemed to indicate that the product might be a mixture rather than a chemical individual.

In order to resolve this sterol mixture, if such it should prove to be, into its components, the acetates were brominated according to Windaus and Hauth (2). When, however, upon standing no separation had taken place, crystallization was induced by the addition of a little alcohol. From the crystals thus obtained, the ether-soluble material was removed by washing. The insoluble residue melted at 203°. Apparently, it may be regarded as the tetrabromide of stigmasterol acetate. The amount obtained was too small to render debromination practicable.

As for the melting point, Windaus and Hauth (2) record 211° as the melting point of stigmasterol acetate tetrabromide. However, melting points of 205° (3), 208° (4) and 210° (5) are also recorded. Moreover, H. Sandqvist and J. Gorton (6), as late as 1930, report 203° as the melting point.

Before attempting the debromination of the ether-soluble brominated sterol acetate, the technique (2) was tried out on the corresponding cholesterol derivative. The attempt was unsuccessful because the zinc dust suspended in the glacial acetic acid coagulated. When absolute alcohol was substituted for glacial acetic acid, the experiment was successful. With this substitution in the technique, the ether-soluble brominated sterol acetate was successfully debrominated. After several recrystallizations, the debrominated acetate melted at 127.5°. Upon saponification the free sterol was obtained melting at 138°. These constants agree with those of sitosterol. Apparently, therefore, the sterol isolated from milfoil is a mixture of stigmasterol and a sitosterol in which the latter predominates.

* OFFICERS ELECT, AMERICAN PHARMACEUTICAL ASSOCIATION FOR 1936-1937

The Board of Canvassers of the AMERICAN PHARMACEUTICAL ASSOCIATION, composed of Gustav Bachman, *Chairman*, Charles V. Netz, and Charles H. Rodgers, all of Minneapolis, Minn., has announced as the result of the mail ballot for the officers of the ASSOCIATION, the election

President-Elect, George D. Beal, Pittsburgh, Pa.

First Vice-President Elect, J. Leon Lascoff, New York, N. Y.

Second Vice President Elect, James C. Munch, Glen Olden, Pa.

Members Elect of the Council, H. C. Christensen, Chicago, Ill., R. P. Fischelis, Trenton, N. J., Ernest Little, Newark, N. J.

These officers will be installed at the next annual meeting of the ASSOCIATION which will be held in Dallas, Texas, the time to be announced later.

COMPARISON OF SPECTROMETRIC METHOD AND ANTIMONY TRICHLORIDE TEST FOR ESTIMATION OF VITAMIN A POTENCY *

BY W S JONES AND W G CHRISTIANSEN ¹

For determining the Vitamin A potency of cod liver oil the U S P prescribes a biological assay. Any vendor, therefore, who markets this product as U S P oil must be able to show, by the official method, that it complies with the specifications for potency. We know that there may be some differences between human response and the response obtained with different species of animals, and that the selection of the test animal is therefore a matter of great importance, but we realize that products of complex composition, used to produce biological effects, should be fundamentally controlled by a biological assay. Even though Vitamin itself is a definite chemical compound, in cod liver oil it is associated with many other compounds which may be present in varying amounts and which may modify the biological effect.

Thus, for the present, the biological assay must be considered the primary test of potency, and other methods secondary ones, supplying preliminary estimates. We present, in this paper, a comparison of the results obtained by two such methods on oils which had been assayed biologically.

The first of these tests—the Carr and Price antimony chloride test—is well known and widely used. During the years of its use in our several laboratories the minute details of the test, upon which depends the value of the result, have been subjected to careful study and control. Much of that work was done in our Biological Research Laboratories.

The second test is a physical one, and depends upon the intensity of the absorption band at 3280 Å in the ultraviolet.

These chemical and physical tests are of great value in both manufacturing and research. They are rapid and inexpensive, and may therefore be used at every intermediate step in both laboratory and plant, supplying quickly and cheaply approximate data which make possible quick decisions and rapid progress, with a reasonable expectancy that the biological assay will confirm the correctness of the action taken. It is necessary, of course, always to keep in mind the limits of accuracy of these tests.

Various workers,²⁻⁸ using the spectrometer, or physical method, have shown that there exists a definite and consistent relationship between the intensity of the absorption band at 3280 Å in the ultraviolet and the biological assay for Vitamin A.

It was highly desirable, therefore, to compare the newer, physical method with the antimony trichloride color test

Our preliminary findings show that the spectrometric method gives no better estimation of Vitamin A potency than does the colorimetric antimony trichloride test as used by us

Eleven oils which had been assayed biologically were tested by the antimony trichloride method and were then sent to laboratories having equipment for the spectrometric assay. Nine oils were sent to Laboratory "A," four of these plus two additional oils were sent to Laboratory "B." In Table I are listed the results of all three assay methods

TABLE I—ASSAY IN TERMS OF U S P 1934 REVISION UNITS OF VITAMIN A PER GM

Oil No	Biological Method	Antimony Trichloride Method	% Deviation	Laboratory A	Spectrometric Method % Deviation	Laboratory B	% Deviation
1	85,750	75,600	-11.8	76,440	-10.9		
2	107,450	78,400	-27.0	94,080	-12.4		
3	2,192	2,240	+2.2	2,784	+27.0	3,000	+36.8
4	2,156	2,054	-4.7	2,523	+17.0		
5	3,080	3,156	+2.5	2,850	-7.4	3,760	+21.7
6	2,156	2,279	+5.7	2,497	+15.8		
7	2,478	2,409	-2.8	2,497	+0.8	2,730	+10.2

9	60,900	64,440	+7.3	60,750	-0.2		
10	236,000	226,000	-4.2			249,000	+5.5
11	171,000	156,800	-9.6			110,000	-35.6

* Laboratory A rechecked this figure and found it to be correct

In Table II the results have been grouped according to the extent to which they differ from the biological assay

TABLE II

Deviation from Biological Assay	Antimony Trichloride Method	Spectrometric Method Laboratory A	Laboratory B
± 5%	45.4%	22.2%	
± 5-10%	27.3	11.1	33.3%
± 10-20%	18.2	44.4	16.7
± 20-30%	9.1	11.1	16.7
± 30-40%			33.3
> ± 40%		11.1	

DISCUSSION

With one exception (Sample No. 11) Laboratory "B" has consistently and with wide variation, obtained higher values for Vitamin A potency than is shown by biological assay

Excluding Sample No. 8 (we believe the value given for this oil by Laboratory "A" is erroneous and should probably be 4522.5) Laboratory "A" has obtained on oils of high potency (Samples Nos. 1, 2, 9) Vitamin A values in reasonable agreement with the results of biological assay. Greater variations occur, however, in the oils of low potency (Samples Nos. 3, 4, 5, 6, 7)

Except in the case of Sample No 2 the antimony trichloride test, as used by us, has given Vitamin A values which are in fair agreement with those obtained through biological assay

We gratefully acknowledge the assistance of the Biological Laboratories of E R Squibb and Sons in conducting the biological assays reported herein

ENTERIC COATINGS II EXCRETION STUDIES WITH SODIUM SALICYLATE TABLETS *

BY MILTON WRUBLE

In an earlier paper (1) the use of calcium sulphide-methylene blue tablets was found of value in checking the effectiveness of enteric coatings qualitatively. As a further step in this direction it was thought desirable to make a quantitative evaluation. Since salicylates are excreted more or less quantitatively, are widely used in medicine and in many cases produce irritation in the stomach when unprotected by a suitable coating, they were of particular interest in this connection.

Salicylates are excreted quite rapidly but incompletely in the urine, mainly as such, and to a small extent as salicyluric acid (2) and a number of other products. Stockman (3) states: "Salicylic acid and salicylates are conjugated and excreted as salicyluric acid. Persons taking up to 180 grams of sodium salicylate per day eliminate no free salicylic acid." Holmes has found (4) that for doses of sodium salicylate of from 2 to 5 Gm the salicylic-salicyluric ratio is constant at the value of 40/60.

The absorption of salicylates is quite rapid and for this reason exceedingly small amounts are at times found in the feces, more often none at all. With full therapeutic doses of about 15 Gm, Hanzlik, Scott and Thoburn (5) and Hanzlik and Wetzel (6) were able to recover in the urine about 75 to 80 per cent of the total administered. They concluded that about 20 per cent of the salicylate was destroyed in its passage through the body.

The rate and duration of excretion of salicylates varies with the dosage, the individual and the individual's state of health. In general, it has been found by Blanchier (7) that with doses of 1 to 2 Gm, excretion is completed in 22 hours, Ehrmann (8) found that excretion lasted from 36 to 48 hours in normal individuals, Geissler (9) noted that complete elimination takes place in 12 hours. However, Sée (10) states that it ordinarily lasts from 24 to 48 hours.

The quantitative recovery of salicylates from tissues and body fluids involves difficulties and complexities not present in foods and simple aqueous solutions. This can be readily appreciated since in passing through the body the salicyl group is conjugated with glycocoll forming a salicyluric acid, whose properties differ from salicylic acid. Moreover, the presence of colloidal and other interfering substances prevent a smooth and quantitative recovery of salicylic acid.

A number of quantitative methods for the determination of salicylates in urine have been developed. None appears entirely satisfactory. A critical survey of these methods has been adequately made by Thoburn and Hanzlik (11). Recently Merz (12) and Blume and Breuning (13) have outlined extraction methods for the determination of salicylates in urine.

* The Research Laboratories, The Upjohn Company, Kalamazoo, Michigan

Since most of the proposed methods show decided weaknesses, Thoburn and Hanzlik have adapted a steam distillation method to the determination of salicylates in body fluids. Briefly their method (14) consists of

- 1 Hydrolyzing an aliquot portion of urine which has been collected until the voided specimen, when extracted with ether and tested with ferric alum, is salicyl free
- 2 Distilling with steam until the salicylates are driven over
- 3 Colorimetric estimation of the distillate with ferric alum

Holmes has criticized (15) this method since he claims that the distillation of the salicylates is incomplete because the salicylic acid is hydrolyzed only very slowly and that at the high temperatures which have to be used the salicyl ring is destroyed to some extent. He modifies the Thoburn-Hanzlik method in several details but his results indicate a lack of consistency.

Several of these methods were investigated by the author and the one finally adopted as most satisfactory was that of Thoburn and Hanzlik with several modifications. Holmes' method invariably yielded low results. The Merz method offered considerable difficulty because of the formation of troublesome emulsions and, as a result, the extraction process was long and tedious.

The Thoburn-Hanzlik method was modified in several details to yield better results. Considerable difficulty was experienced in completely recovering the salicylates from the average urine and with some urines the last traces were removed only after long and vigorous distillation. No doubt some urines are more highly conjugated than others and this accounts for the resistance displayed in the recovery of the salicylates. By keeping the volume of urine as low as possible during distillation, the recovery is considerably hastened. It was found advantageous, therefore, to begin with half the volume of urine recommended, namely, 50 cc.

Enough phosphoric acid is added to the urine to make it distinctly acid and the large excess recommended by Thoburn and Hanzlik avoided. Phosphoric acid proved to be the best hydrolyzing agent because of its high boiling point and also because it is not readily decomposed. However, with a large excess present it is quite possible that some is mechanically carried over into the distillate.

In this connection Thoburn and Hanzlik (16) make the following statement

"The distillate should be perfectly clear, practically colorless and possess a nearly neutral or very slightly acid reaction to litmus paper."

However, Nicholls has shown that the solution should be appreciably acid. He states (17)

"Contrary to the usual statements in the literature, this test should not be applied to a neutral solution of a salicylate, as the color so produced is not of satisfactory shade. To obtain a good tint the solution should be slightly but appreciably acid, the intensity of color from a given quantity of salicylic acid decreasing with increasing acidity."

For the colorimetric comparison in Nessler tubes, salicylic acid rather than sodium salicylate as recommended, was used. It was found almost impossible to match the colors when sodium salicylate was employed as a standard. From what has already preceded it is apparent that the standard should be appreciably acid.

A 1 per cent solution of iron and ammonium sulphate which has been previously boiled and filtered was found to be superior to the 2 per cent solution

recommended by Thoburn and Hanzlik. The latter solution is considerably more intense in yellowish green color and with dilute solutions interferes with the colorimetric determination.

EXPERIMENTAL

Eight individuals ranging in age from 18 to 25 years were each given three 5 grain tablets of sodium salicylate both uncoated and enteric coated.¹

A complete 48-hour specimen of the urine was collected in each case. The urine samples were properly preserved and several determinations made on each sample. Distillation was carried out in each case until the ethereal extract of the residue showed no pink coloration with ferric alum.

The following table indicates the results obtained.

TABLE I

Patient	Total Volume Collected in 48 Hours	Condition of Tablet	Gm. Salicylate Recovered
J W A	1750 cc	Coated	0.12 Gm
	1905	Uncoated	0.18
E J V	1100	Coated	0.33
	1570	Uncoated	0.39
E E B	1635	Coated	0.38
	1550	Uncoated	0.24
M F	1875	Coated	0.38
	2675	Uncoated	0.35
K K	1450	Coated	0.14
	1325	Uncoated	0.23
D F	2370	Coated	0.53
	3380	Uncoated	0.36
W W	2225	Coated	0.30
	2210	Uncoated	0.30
S K	3620	Coated	0.28
	3280	Uncoated	0.25

CONCLUSIONS

1. Several modifications of the Thoburn-Hanzlik method for the determination of salicylates in urine have been outlined.

2. The results indicate a close agreement between the quantities of salicylate excreted in the coated and uncoated tablets. Since no gastric irritation was reported, this is an indication of the effectiveness of the enteric coating.

3. The average recovery following the ingestion of 15 grams of salicylate appears to be approximately 30 per cent.

COMPOUND SOLUTION OF CRESOL—THE VARIATION OF PHENOL COEFFICIENT WHEN DIFFERENT OILS ARE USED FOR SAPONACEOUS BASE *¹

P L BURRIN, A G WORTON AND F E BIBBINS ¹

The Bureau of Animal Industry of the United States Department of Agriculture has been very active in its supervision of the interstate shipment of domestic animals, and as a part of their duties they have described means for disinfecting cages as well as animals. Since such a procedure is common and within their control, it is only a natural sequence that they should be highly interested in the control of the material used in these prescribed methods of disinfecting. This department deviated from the standards which were laid down by the United States Pharmacopœia for compound solution of cresol as early as 1915 (1). They deemed it necessary, in view of their extensive recommendations for the use of soap solutions of cresol, to lay down requirements in many cases more stringent than those in the United States Pharmacopœia. The economy of manufacture was given due consideration when making these specifications as well as the effectiveness of the final product.

In the interest of improving compound solution of cresol U S P the authors tried several oils which are available for use in the manufacture of such a product. Compound solutions of cresol were prepared, following the directions of the United States Pharmacopœia, tenth revision, using corn oil, peanut oil, sesame oil, coconut oil, and soy bean oil (2). In order to have a control sample, a solution was made

* Scientific Section, A P H A, Portland meeting, 1935

¹ From the Control Laboratories, Eli Lilly and Company

from linseed oil Comparison of the resulting finished preparations was then made, particular attention being given to the phenol coefficients

The usual means of comparing the effectiveness of these cresol solutions has been the determination of their phenol coefficient There has been considerable discussion about the actual worth of the phenol coefficient in the evaluation of compound solution of cresol Every one agrees that there can be a variation in this determination due to the age and viability of the organisms used, the media, the test broth, and perhaps in the technique in running the test Whatever may be the opinion as to the value of a phenol coefficient, it does seem that on a comparative basis it has value In the following experiments the phenol coefficients were determined on all samples at the same time with the same cultures Whether the phenol coefficient appears high or low, our only purpose in assigning numerical values is to show the ratio of the phenol coefficients in the experiments performed As previously mentioned, the phenol coefficients were determined by the standard method Although we did not attach a great deal of significance to the phenol coefficient as a true lethal index, we considered it of value in showing the comparative activity of the solutions prepared from the various oils The results of these determinations are shown in the following table It is interesting to note from the table that the sample made from cocoanut oil shows a phenol coefficient 100 per cent greater than the coefficients shown by samples made with other oils, when tested with *B typhosus*, and 50 per cent greater when tested with *Staphylococcus aureus*

It is customary in the manufacture of large quantities of compound solution of cresol to filter the liquid as a final step in order to obtain a brilliant product Consequently, the ease with which the various solutions filtered was considered an advantage in selecting the oils which might be desirable For this purpose the solutions were filtered, and the ease with which they ran through the filter paper is noted in the following table

TABLE OF COMPARISON

Oil Used	Filterability	Phenol Coefficient Using <i>B typhosus</i>	Phenol Coefficient Using <i>Staph aureus</i>	Solidifying Point Degrees Fahrenheit
Corn	Good	1 5	1 0	-20
Peanut	Very poor (gelatinized)	1 0	1 0	Gelatinized
Sesame	Good	1 5	1 0	-15
Cocoanut	Good	3 0	1 5	-15
Soy bean	Good	1 5	1 0	-20
Linseed	Good	1 5	1 0	+ 5

The water content and excess alkali were determined in all samples, and found to be within the usual limits It was at this point we discovered that compound solution of cresol made from sesame oil had a very poor solubility in alcohol

In observing the several experiments it was noted that the samples made from peanut oil became very thick, and turned to a jelly when stored at room temperature When the sample was shaken, it again returned to a liquid condition, but when allowed to stand undisturbed it again gelatinized Since compound solution of cresol may be subjected to rather low temperatures, and since it is very necessary that a dispensable liquid which does not separate at these low temperatures be obtained, it was decided to determine the chill points of all experiments

as outlined in *Bulletin* No 1308 of the Agriculture Department (3) The results of these tests are recorded in the following table

It can be observed readily from the preceding table that there are several oils just as desirable as linseed oil for compound solution of cresol The authors sought to eliminate any comparison of the oils on a price basis, so no experiments were made to ascertain just how low a grade of oil could be used for making the soap of the various products, consequently, all of the oils used were of high grade Corn oil and sesame oil make a satisfactory product, which has a chill point somewhat lower than the product made from linseed oil Coconut oil makes a satisfactory product which shows a phenol coefficient from 50 to 100 per cent higher than the coefficients shown by products made from other oils The price of coconut oil is slightly higher than linseed oil, but it apparently makes a product that is decidedly more efficient

CONCLUSIONS

It may be said that there are several oils, namely, corn, soy bean, coconut and linseed that will make a satisfactory cresol compound Peanut and sesame oils are not desirable for use in such a product It appears from the above experiments that coconut oil is the only one of this group that can be used to manufacture a satisfactory product which at the same time shows an increased phenol coefficient For this reason it may be desirable as a base for compound solution of cresol Finally, it seems that there may be oils more desirable, for the manufacture of these soap cresol solutions, than linseed oil that is now prescribed by the United States Pharmacopœia

IMPROVEMENT IN TECHNIQUE IN THE PREPARATION OF THREE COMMON PRODUCTS *

BY EDWARD D DAVY

There are distinct advantages in the modification of some of the commonly accepted formulas both as to the ease of preparation and the appearance of the finished product, and this without altering the value of the product in any way

The three products used to illustrate improvement in technique are Syrup of White Pine Compound, N F, Elixir of Phenobarbital, and Soft Soap, U S P IX

Syrup of White Pine Compound when prepared by the N F formula without change yields a product which, upon aging, results in an oleaginous suspension which, after a few days, forms an oily layer on the surface of the syrup making an unsightly preparation This condition may be corrected by siphoning or otherwise removing the clear liquid after aging The directions for preparing the product do not provide for clarification

The Oil of Sassafras which represents an excess over saturation is the chief offender, though the resin from the Balm of Gilead Buds also contributes to this

* Section on Practical Pharmacy and Dispensing, A Ph A

oleaginous material To correct the excessive oil residue in this syrup, if one adds the oil to the menstruum the excess is retained by the drug, and saturation is all that should be expected The sugar is dissolved in the pereolate and the chloroform added as indicated in the formula

Elixir Phenobarbital—While no formula appears in our standard texts this elixir was selected because of the difficulty encountered in filtering the finished product when eudbear is used as the coloring agent In addition the maximum color effect is not obtained when the eudbear is macerated in alcohol as is usually prescribed The alcoholic extract or tincture when added to the preparation results in a product not brilliantly clear and the colloidal material from the previously clear alcoholic solution makes filtration very difficult, being accentuated by the presence of both glycerin and syrup

This filtration difficulty is avoided by macerating the eudbear in alcohol, glycerin and water in approximately the same ratio as is represented in the finished product Filtration is fairly rapid and the depth of color is increased and it remains brilliantly clear The phenobarbital is dissolved in a small amount of alcohol reserved for this purpose and added to the clear filtrate from the eudbear Sugar in amount to the syrup prescribed is then dissolved by agitation

To show the solvent action of glycerin on the coloring from eudbear, one need only to evaporate a portion of the alcohol-glycerin filtrate The glycerin residue remains perfectly clear and may be diluted with water without loss of its brilliancy

Sapo Mollis U S P IX—(Cold process) Since there is a considerable demand for a potash soap as contrasted with the U S P X sodium-potassium mixture, suitable for liquefaction for use in general soap service and in the surgery of hospitals, it was thought advisable to offer a convenient procedure for its preparation, one which has worked successfully in our laboratory for several years

The following procedure makes a good soft soap, or if one chooses he may, by adding distilled water, prepare a liquid soap containing up to 22% anhydrous soap The U S P IX formula with regard to oil, potassium hydroxide and the initial water to be used needs no change

The alkali is dissolved in distilled water (10% of the weight of finished soap or 100 cc for 1000 Gm of soft soap) and immediately add all the oil and stir well For small amounts of soap the saponification will be completed in from three to four hours Stirring the mixture at intervals to emulsify the unsaponified oil is all that is necessary for saponification Occasionally when working with small amounts of soap and always when working with quantities of 500 to 800 pounds or more it is necessary to increase the water content by about 20% as saponification approaches completion Completeness of saponification may be told by dissolving a small amount of the soap concentrate in distilled water, if saponification is complete a clear solution results

One should check the alkalinity or acidity by dissolving a weighed sample of the soap concentrate in alcohol and proceed as usual to adjust the product to any degree of alkalinity, or neutrality if that is desired All additions of either alkali or oil must be made while in the concentrated form

If one desires he may make a solution of the alkali and assay it previous to mixing with the oil—I have found that potassium hydroxide, U S P grade, when properly protected from moisture, may be added in the quantity prescribed and a

soap with only a slight alkalinity results Benzoic Acid may be added to a liquid soap to reduce alkalinity when it is desired to make a neutral or acid-liquid soap

POTENT MEDICAMENTS IN SUGAR-COATED PILLS AND IN CONFECTIONS *

BY JOHN F. SUCHY¹

The subject of pill-coating and candied medicaments has received much consideration in recent years. The coated commercial pill or tablet has become a masterpiece of attractiveness and palatability. Disagreeable substances have been skilfully blended into confection form until their gustatory incompatibilities have completely faded away. Repellance has given place to attractiveness and one can now look forward to the swallowing of his tonic or cathartic dose, of strychnine, of Nux Vomica or of Atropine with pleasant anticipation. Nature's warnings of physiological potency—extreme bitterness or nausea—have become masked. Disagreeables have become agreeables—a creditable achievement of modern pharmacy.

As is true with so many good things, undesirable factors so frequently manifest themselves, calling for modification or restriction. The barbiturates once hailed as hypnotics par excellence have been found to have a destructive action on the white blood cells. Emetine though found distinctly amoebicidal, cannot be practically used in tooth-pastes in sufficient quantities to effect pyorrheal cures. So it has also proved true of our sugar coatings and confections. Frequent newspaper head-lines call attention to poisonings of children due to accidental ingestion of pills or other medicaments containing highly potent substances. More intimate experiences of members of this group will undoubtedly recall instances when these individuals themselves, their children or child-friends have eaten such pills or licked off their alluring coatings. The interest of the author in this study began only last fall and even since then articles regarding two pertinent incidents have appeared in the local press of Western Montana, an area occupied by less than 250,000 inhabitants. The first—a case in Orchard Homes, a community adjacent to the city of Missoula, wherein a 2½ year-old girl swallowed eighteen aspirin gum tablets with the result that her subsequent condition was for some time considered as critical. The second incident occurred only about two months ago in Great Falls where two youngsters showed symptoms of poisoning, presumably due to the eating of pills containing belladonna—one of these cases resulted in a fatality.

About two years ago a rather pitiful case was reported from Butte where an uncle from one of the eastern states had just arrived for a visit with his Montana relatives and accidentally or perhaps thoughtlessly left a package of Hinkle's Pills on the dresser of his room. Somewhat later during his absence his little niece spied the alluring pellets, tasted them, found them good and ate several with the sad sequel that shortly afterwards she died in convulsions.

In a fine address (1) delivered in 1930 and later published in the *Journal of the American Medical Association*, President Aikman of the Pediatrics Society of

* Section on Practical Pharmacy and Dispensing, A. PH. A., Portland meeting 1935

¹ Associate Professor of Pharmacy, University of Montana, Missoula, Mont.

Rochester presents statistical data taken from New York Health Reports which show that in that state alone during a period of four years, there occurred 177 deaths traceable to accidental poisonings. Eighty children of five years of age or under were included among the victims. Forty of these deaths were due to the eating of pills or tablets containing strychnine. This list does not include cases which resulted in recovery nor does it include many of those which proved fatal before the arrival of a physician or where his period of supervision was of too short duration to warrant proper conclusions. A report compiled by the Metropolitan Life Insurance Company (2) lists 273 deaths of children under five years of age insured in the Industrial Department of this company as due to accidental poisoning. Definite information of the type of poison consumed was reported in 242 of the cases. Strychnine was held responsible for 82 of these deaths or approximately one-third of those in which the nature of the poisonous substance was known. Forty-six of these deaths were found to have been due to the eating of strychnine pills or tablets. Quoting from the bulletin itself—

‘Children, and especially young children, are the most frequent victims of accidental poisoning. Strychnine takes a heavier toll of child life than does any other poison.—More than half of the young children who die from strychnine poisoning are victims of pills or tablets containing this substance.’

It has been reported that more deaths occur in the State of New York among children of less than five years of age because of accidental consumption of strychnine pills than are caused by both rabies and tetanus.

While it is true that the relative percentage of fatalities is likely to be lower in Western Montana owing to less congestion of population and a consequent lesser chance of youngsters picking up poisoned medicaments in rubbish heaps, abandoned houses, etc., yet even in this area the hazards involved merit consideration. Surely there is need of a greater care in the dispensing and handling of dangerously potent pills and confections. The American Medical Association and other scientific groups have seriously considered the subject. It has been suggested that pills and tablets containing poisons be left uncoated which argument does not seem unreasonable. Perhaps it would be even well to coat these deadly buckshot with aloes or quinine or some other similar bitter substance. It has also been suggested that caution labels with appropriate antidotal directions be applied to containers in which these substances are dispensed. This remedy likewise seems worth while for cautionary specifications on the label would tend to localize the sale of these remedies to the *bona fide* drug store, thus stressing the professional status of pharmacy with the laity. The true nature of even such old remedies as Hinkle's Pills makes the drug store the proper and logical place for their sale. To purchase strychnine one must invariably sign the poison register but to buy it in candied form one needs only to write to some mail order house or in many states to go to the grocery or department store. Besides, what youngster would want to eat the unblended alkaloid anyway?

It has been suggested that the omission of strychnine from laxative pills would markedly lessen the number of accidental poisonings. Several authorities, including Dr. Fantus (3), express a certain skepticism as to the therapeutic utility of the alkaloid in such preparations. In their splendid article published in one of last

December's issues of the *Journal of the American Medical Society*, Drs Yonkman and Singh (4) report results of five experiments performed on four persons, all of which seem to indicate that strychnine has little if any peristaltic effect even if administered in amounts two or three times as large as is contained in the usual cathartic pill. Both of these workers strongly advocate the discontinuation of the alkaloid for purposes of promotion or augmentation of catharsis.

We are ever ready with our protests when the dog poisoner plies his business of canine destruction, and throws out his toxic bait. "This is criminal," we say, because of the hazard to children—yet who worries when the careless tenant, too frequently uninformed of the possible dangers, moves out of a dwelling and leaves behind him veritable traps of candied poisons. The problem of candied or sugar-coated medicaments does merit consideration of this organization.

NATIONAL UNITY OF STATE COOPERATION BETWEEN PHARMACIST, PHYSICIAN AND DENTIST *

BY GEORGE C. SCHICKS ¹

Much has been written to date concerning the closer cooperation between the allied medical professions. The thinking pharmacist has come to realize that if prescriptions employing official drugs and preparations are to be written for, that authentic information regarding United States Pharmacopœia and National Formulary preparations must be effectively and repeatedly presented to those groups of men who are licensed by law to prescribe medication. It is encouraging to note that progressive individual pharmacists have devised effective means of meeting the situation of closer cooperation with the medical men whom they serve. It is equally stimulating to watch the progress of various county pharmaceutical associations and the contacts they have made with county medical and dental groups. New Jersey county pharmaceutical groups have been especially active in their efforts to encourage inter-professional relationship, and because New Jersey has gone a step further and organized a state-wide movement to foster closer contacts between pharmacist, physician and dentist, I am asking your permission to outline briefly the work that this state is undertaking in its effort to increase the professional usefulness of its practicing pharmacists.

"In the New Jersey Pharmaceutical Association, there is a Professional Relations' Committee with duties obvious from the name of the committee. This committee, through the cooperation of the state medical and pharmaceutical associations, has created the Joint Committee on Professional Relations of the

* Section on Legislation and Education, A. Ph. A., Portland meeting, 1935

¹ Assistant Dean, Rutgers University, College of Pharmacy

New Jersey Medical Society and the New Jersey Pharmaceutical Association The physicians on the Joint Committee are the members of the Medical Practice Committee for the State Medical Society The pharmacists on the Joint Committee are appointed by the State Pharmaceutical Association These groups working through their respective associations have authorized the publication of a New Jersey Formulary This publication does not conflict with the official publications—the United States Pharmacopœia or National Formulary, for none of the preparations in the New Jersey Formulary are official If and when they are accepted by either of the official publications, the preparations will be dropped from the New Jersey Formulary To date there are eleven formulas which have been accepted for the New Jersey Formulary The formulas represent popular combinations of drugs which are popularly sold and which can be made by the pharmacist

"Each month the *Journal* of the New Jersey Medical Society contains an article concerning these preparations or others official in the United States Pharmacopœia or National Formulary The same article is printed in the *New Jersey Journal of Pharmacy* In this way both professions are made aware of what is being recommended and prescribed employing official drugs and preparations When enough formulas have appeared in the *Medical Journal* to warrant their compilation into a printed New Jersey Formulary, the Medical Association will supply its own members with the "New Jersey Formulary" In the interim the State Pharmaceutical Association has had printed in loose-leaf form, the formulas published to date, which leaves are available at small cost to pharmacists for distribution among the physicians they serve

"Inasmuch as physicians treating Federal Emergency Relief Administration patients are required to prescribe official drugs and preparations, the F E R A has approved the use of the 'New Jersey Formulary' preparations This approval has given the 'New Jersey Formulary' most favorable publicity among physicians of the state

"This summer at the meeting of the State Medical Society the Pharmaceutical Association was asked to make a display of 'New Jersey Formulary' preparations in the Scientific Section, so that the medical men could see the preparations and have them discussed if they so desired At the same meeting a very comprehensive report of the work of the Joint Committee was made by one of the medical men on the committee to his fellow association members The pharmacy members of the Joint Committee were the guests of the Medical Association at the above-mentioned meeting Next year the Medical Practice Committee or the medical men on the Joint Committee will be guests of the New Jersey Pharmaceutical Association

"At a luncheon meeting of the Joint Committee, a motion was presented by one of the medical men, and passed, which provided that during the coming year qualified speakers be invited by the Medical Association to appear at the various county medical organization meetings, to instruct physicians on the 'New Jersey Formulary,' United States Pharmacopœia and National Formulary drugs and preparations At such meetings pharmacy speakers will be given the opportunity not only of discussing prescription writing and the use of official drugs and preparations, but they will be afforded an excellent opportunity to discuss the economic aspect of such prescribing

"Here, for example, are a few comparative costs to be considered when employing 'New Jersey Formulary' formulas as compared with the proprietary articles

N J F Preparations	Amount	Proprietary Cost	N J F Cost
Elixir Phenobarbital	1000 cc	\$ 5 00	\$ 0 75
Syrup Potass Guaiacoli Sulphonate	1000 cc	4 25	0 95
Pulvis Bismuthi Subcarb Comp	100 Gm	0 55	0 17
Nebula Ephedrine	1000 cc	26 40	2 06
Nebula Ephedrine Comp	1000 cc	26 40	2 14
Elixir Amidopyrine	1000 cc	6 00	1 43
Pulvis Alkalinus Effervesceus	100 Gm	0 50	0 17
Pulvis Bismuthi Subnitrat Comp	100 Gm	0 47	0 39
Pulv Bismuthi Subnitrat Comp cum Carb Ig	100 Gm	0 47	0 40
Liq Ephedrin Sulph	1000 cc	28 00	2 26
Liq Ephedrin et Epineph	1000 cc	28 00	3 79
		<hr/>	<hr/>
		\$126 04	\$14 51

"It costs the pharmacist \$14 51 to manufacture all eleven formulas in the quantities stated in the 'New Jersey Formulary' To buy them under proprietary name costs \$126 04 A saving of \$111 53 I shall leave it to you as to whether or not this sum is worth saving

"Allied professional cooperation has not confined itself to state medical and pharmaceutical units, for recently has come a request to Rutgers University College of Pharmacy from the chief of the staff of one of the largest hospitals in New Jersey that a course in prescription writing and the use of official drugs and preparations be given physicians and internes of that hospital When such a course is satisfactorily arranged the chief of staff physician will make it mandatory that the physicians on his staff take the course From one such hospital fifty to seventy-five medical men would be required to take such instruction With the request for such a course comes the information that it would not be necessary to make such instruction obligatory, for the physicians of that hospital are eager to get the information

"With this rather hurried résumé of professional cooperative trends in New Jersey, permit me to suggest again as I did in our meeting last year, that this cooperative trend is of far too great moment to be consigned to individual pharmacists, local and county pharmaceutical groups or state pharmaceutical associations Should not a movement upon which rests the very security of professional pharmacy, be vital enough to every pharmacist who is interested primarily in the professional aspect of his service, that it be made a movement of national scope? Should not such a movement warrant a national program to unite the pharmacists throughout the country, in a supreme effort to build the same professionalism which is the present heritage of both the medical and dental professions?

"I am aware that many local and county pharmaceutical associations scattered throughout this country are doing effective work among physicians and dentists Other groups have failed because they lacked a definite method of attack and a sane program to be followed to a satisfactory conclusion

"Pharmacy to-day should have a body created within the AMERICAN PHARMACEUTICAL ASSOCIATION, manned by capable and experienced men, with re-

search laboratories which will provide men in the profession with information regarding new drugs, chemicals and preparations appearing in constant flow on the market. Pharmacy should have a body created within the AMERICAN PHARMACEUTICAL ASSOCIATION which could compile information regarding the activities of local and state pharmaceutical organizations and from the successful activities of such groups develop a national program to foster closer cooperation between the allied medical professions.

"In justification of my argument for the creation of a national bureau for pharmaceutical information, I am making mention of a similar service in both the medical and dental professions. Scientific information as well as association proceedings are disseminated from the national headquarters and laboratories maintained by the American Medical Association and the American Dental Association. All new phases of the practice of each group, new medicaments, economic problems, activities of county and state organizations, when their work merits being the pattern for other county and state groups—all of this information goes out to the physician from the headquarters and the Council on Pharmacy and Chemistry of the American Medical Association, all of this information goes out to the dentist from the headquarters and the Council on Dental Therapeutics of the American Dental Association. Why then should not a similar informative organization be provided by the AMERICAN PHARMACEUTICAL ASSOCIATION? The AMERICAN PHARMACEUTICAL ASSOCIATION has a record behind it of accomplishments of which it can well be proud. It has always stood for the highest ideals in pharmacy and its contributions to the pharmacists of this country have been exceedingly noteworthy. I could conceive of no more appropriate information bureau and investigation laboratory for the AMERICAN PHARMACEUTICAL ASSOCIATION than the new Pharmacy Headquarters Building in Washington, D. C. From there all of the worthwhile pharmaceutical information could find its way to the members of the AMERICAN PHARMACEUTICAL ASSOCIATION. There the constructive professional cooperation activities of individuals and organizations could be reviewed and from there could be broadcast a program which is a live, workable project, with thoroughly outlined ideas, scientific displays, scientific information for pharmaceutical speakers and a speaker's bureau for definite pharmaceutical districts or zones. The work among physicians, dentists, veterinarians, chiropractors and medical opticians could then follow a well-planned, definite and effective program.

"So that this important phase of pharmaceutical service can be placed before the AMERICAN PHARMACEUTICAL ASSOCIATION for their consideration the following recommendation is made:

"I recommend that the Section on Education and Legislation¹ go on record as requesting the AMERICAN PHARMACEUTICAL ASSOCIATION to create a body or bodies with the necessary working facilities to give the pharmacists in this country up-to-date information on such pharmaceutical and medical material as new drugs, preparations, formulas, standards, plans for detailing doctors and dentists, also other medical groups, and other information which will prove helpful and be instrumental in increasing the cooperation and service of the pharmacist to the allied medical professions. This information is to appear periodically throughout each

¹ See page 711 JOUR. A. PH. A., for August 1935

year and some method be devised so that all pharmacists may be privileged to take advantage of such a pharmaceutical service "

DENTISTRY AND PHARMACY *

BY P T MEANEY, D M D

"On behalf of the dentists of the Northwest, and particularly the dentists of Oregon, I wish to thank the AMERICAN PHARMACEUTICAL ASSOCIATION for this opportunity of appearing before the assembled delegates "

In the history of civilization a century is but a brief span In the history of pharmacy and medicine five score years seem longer, but they are still a very small portion of the life of a profession In the history of American dentistry that period includes by far the more important part of its development Much of the early history of pharmacy, medicine and dentistry is more or less involved in obscurity, and this is particularly true of pharmacy and medicine They are not to be discredited on this account because history is, for the most part, a succession of fables which the people agree to follow They take what is given to them by historians, who, in turn, use what they can of the records which are available History must always be read with an open mind Science, as we know it, is essentially modern, although its foundation was laid in remote antiquity We find that in early periods all knowledge was more or less confused, and there was no differentiation between professions which are widely separated to-day

It has been said that the tripod upon which every profession rests, if it becomes finally established, must be The school for the instruction of the future graduates, the scientific society for fraternal intercourse and the presentation of knowledge, old and new, and the journal, to disseminate knowledge and to stimulate a wider education and a more general improvement by reaching a larger public In short, literature, education and organization are the foundations of any lasting profession One cannot say which is the most important, but one can safely assert that organization is a great consolidating influence

A man cannot become educated in a profession until there is a recorded history of that profession There must be available a carefully digested store of ideas, experiences and conclusions of the past, for it is upon the past that the present is founded Education is what raises a craft to the dignity of a profession A craftsman needs only to be trained A professional man must be not only trained, but he must also be educated This education can best be acquired from the literature of the profession

Historically, the profession of pharmacy antedates the other health service professions

With a history dating back four thousand years, broken only by periods of desperation for improvement, the professions of pharmacy and medicine, which were closely allied during most of their early history, have struggled through the ages to become at present two of our outstanding professions In the early Assyrian,

* An address given at the Eighty-Third Annual Meeting of the AMERICAN PHARMACEUTICAL ASSOCIATION, Portland, Oregon

Egyptian and Chinese civilizations, we find some very interesting incidents relating to the professions of pharmacy and medicine. There is less known of the pharmacy of ancient China than there is of any other civilization, due, probably, to the fact that the Chinese have always been reticent and secretive to an unusual degree, and because there has been less research in the ancient literature of this living nation than in the literature of many other nations that have disappeared. There is a pharmacopœa-like compilation in Chinese called the Great Herbal. It consists of forty volumes and contains quotations from the works of nearly one thousand authors, many of whom date from a period long prior to the Christian era. The science of medicine, which includes pharmacy, is referred to as a benevolent art. Proof that there were no dentists in China during these periods, and if there were they were regarded with great favor, is indicated by a reference to the following early history.

There were many medical divinities in the religions of China. Of the seventy-two Buddhas, twenty-nine are gods of healing or of drugs. In Taoism, which is a philosophy of abstract virtue, a great part is played by the Yin Yang symbol, or Great Monad, which is a protective charm against evil. Taoism abounds with charms, lucky days and perfect numbers. Rewards and punishments are abundant. Of one hundred fifty separate and particular hells, one is reserved for pharmacists and one for physicians, but there is no mention of dentists. The thirteenth hell is where the victims are perpetually forced to swallow hot, disagreeable medical decoctions.

The profession of pharmacy has been responsible for the development and perfection of many of the basic sciences, chemistry being one of the most outstanding. This profession acts as an intermediary between the other health service professions and the public, therefore, indirectly, you become responsible to a large degree for the health of the great mass of humanity, a responsibility which no other health service profession can boast. Your profession has contributed to all other health service professions without having lost its identity.

From the time of Hippocrates, four hundred years before the Christian era, until the 15th century, all information on dental disease was a small part of medical literature. In 1728 Pierre Fauchard, in his book entitled "Surgeon Dentists," assembled the best of all that was known in dentistry up to that time. Shortly after the 18th century there began to appear in France small volumes written by surgeon-dentists and designed for the laity. Other writers in Europe continued to write upon dental topics and in the American colonies, in the 17th and 18th centuries, the only books on dentistry were the medical books. The main influence on dentistry came from Great Britain during this period. The five important British authors were Berdmore, Hunter, Blake, Fox and Murphy. The reading of these books from Europe stimulated writings in America. In the 19th century several American books appeared by American authors, Doctors Skinner, Flagg and others. The culmination of dental learning at that time was a book by Samuel S. Fitches, published in New York in 1829, written in six different languages. It was a digest of everything ever written on Surgeon Dentistry. It gave a soul to this branch of surgery, which had previously been lacking, and gave to the American dentists a concreteness which they had never had before. Other books written about this time established the preeminence of American dental literature.

Most writers on American dentistry start their history in the first decade of the 19th century. It is true that until 1840, in the United States, medicine and dentistry were essentially one.

The period beginning in 1830, and ending with the panic of 1837, was a period of speculation, mutation and popular unrest. There were acute disturbances within the medical profession itself, which, together with the general unrest, were to have a pertinent relation to autonomous dentistry.

Elisha Perkins' patented treatment of ills by galvanic current, generated by "metallic tractors," had been the vogue in the early years of this century. After the novelty wore off, another cult arose which taught that all medicines not of plain origin were poisonous. The members of this cult adopted the name of "Botanico," or Thomsonians, and received patents on their medicines. Requiring no training, experience or education, but only a sum of money for a book of instruction and a supply of medicine, the cult became popular, grew and prospered. To the annoyance caused by these and other cults was added the problem of medical sects.

Homeopathy, founded by Samuel Christian Hahnemann, was based upon the theory of drug potentiality and was a protest against nauseous doses in vogue with the regular school of medicine. Although there were no institutions in which homeopathy was taught, it made rapid progress because the public was in a restless mood toward medicine, owing to its recent attacks on the cults.

The Botanic-Electic, another powerful sect, was a protest against polypharmacy. They taught the doctrine of specific—the use of a single drug for each disease.

Without precedent, the new dental school founded in Baltimore in 1840 was necessarily modeled after existent medical schools. There was no requirement of preliminary education, and in order to attract medical school graduates, the full course was fixed at a single term of sixteen weeks. There were no clinical facilities, and the faculty, consisting of two physicians and two dentists, merely gave a series of didactic expository lectures, after which the student received the degree of doctor of dental surgery.

Five years later, in 1845, the Ohio College of Dental Surgery was established in Cincinnati. Patterned after the Baltimore School, but with some new features, it became the Western influence in dental education.

The one-session course was soon abandoned for two sixteen-week terms. This made the dental course the same length as the course in most medical schools. Unlike medical training, there was no requirement that the student continue work under a preceptor. The paucity of competent dental surgeons to serve as preceptors forced the dental schools to put clinical instruction into the school curriculum. At this time clinical instruction was not yet part of the medical training. There was little work done under preceptors until 1867, when the Harvard Dental School inaugurated a requirement of sixteen months under a preceptor, in addition to the school course, before the degree was conferred. The current dental journals hailed this as a great advance in dental education.

Another unfortunate occurrence was the application of the term "mechanical dentistry" to that part of dentistry connected with making dentures, as distinguished from the phase of operating on the living teeth of the mouth. Thus, the opponents of dentistry called mechanical dentists "mechanics" and classed them with

the various types of craftsmen, especially after they began to patent their inventions

The medical profession considered patented instruments and appliances of the same ilk as patent medicines, and so this became still another factor in estranging the professions

In an attempt to obviate the difficulty which prevented any of the societies from becoming national in character, Elisha Townsend organized the first American Dental Convention in 1855. These national conventions, like their medical counterparts, proved unsatisfactory because of lack of continuity. There being no continuing of officers, the conventions were a series of annual assemblies rather than meetings of an organization, at intervals of a year. There was no uniformity of policy or method, and no such affiliation as one would expect in an organization of persons of the same profession, with ostensibly the same aims, ideals and purposes.

The organization of the National Dental Association in 1897, and its reorganization in 1913 to become the American Dental Association, has continuously expanded its activities, until they now include a large number which extend into every field of the art and science of dentistry, and may be grouped into a dozen or more categories.

The practice of dentistry has not attained perfection. There is no dead level of perfection, and it is well that this is so, for the constant urge of progress is always an abiding stimulus to advancement. Important discoveries and improvements show that the evolution of dentistry has not been halted. As a health service, dentistry has never been more useful or widely appreciated. As a profession, it has never more earnestly and successfully striven to increase steadily in effectiveness.

Dentistry is a natural division of health service, it is a natural division of medicine.

For more than one hundred years dentistry, as a profession, has steadily improved. In the immediate past, the use of medical sciences in dentistry has made dental practice more scientific and effective. The use of medical sciences in dentistry, where they might be just as appropriately and effectively labeled "dental sciences," makes dental practice more scientific, and therefore more efficient. Medicine, in its most comprehensive meaning, includes the sciences and arts of health service in all aspects and in all relationships. In this generic sense, medicine includes not only conventional medical practice, but also dentistry, public education for the protection of health and for the prevention of disease, nursing, pharmacy and public health administration. All of these services are related to the human body and the maintenance, restoration or support of its function.

Recent graduates of a number of dental schools are receiving much more practical pharmacy in the dental curriculum. Dean Mickelsen, of the Pharmacy Department of North Pacific College, was one of the first to inject practical pharmacy training into the dental curriculum of that institution, and, in fact, he was the first to establish this training on the West Coast. Assistant Dean Schicks, of the Department of Pharmacy of Rutgers University, Newark, New Jersey, was responsible for similar training on the East Coast, and there are several other dental schools in the United States that are now providing this training.

I am sure that you are mindful of the contribution which dentistry has supplied both medicine and pharmacy

In 1844, Dr Horace Wells, a dentist of Hartford, Connecticut, discovered the use of nitrous oxide, or "laughing gas," as it was first popularly called. The use of ether was discovered by Dr T G Morton, a dentist of Boston, Massachusetts, in 1846. The first operations performed under these anaesthetics were for the extraction of teeth.

The dental profession has been instrumental in doing a great deal of research regarding diets in relation to dental caries, the research of which has brought a demand for large amounts of phosphorus-calcium combinations, also cod liver oil.

The American Dental Association has a council similar to that of the American Medical Association, which was organized to determine the worth of various drugs and preparations used in dentistry. It is organized so that men in the dental profession can take guess work out of their medicaments and dentifrices. A council determines the therapeutic and scientific usefulness of products manufactured for dental use. In this way, the American Dental Association is attempting to rid its ranks of unscrupulous manufacturers who have no regard for either science or truth. It is refusing to rent floor space at dental conventions to manufacturers of questionable products, its leading dental journals are refusing to sell advertising space in the journals to manufacturers whose products are fraudulent or worthless. In line with its campaign to inform its members of worthless products through the reports of its council, it has laid down rigid rules covering the admission of proprietary articles to the list of accepted non-official dental remedies.

Of course, a manufacturer may have a product which is useful and represents it truthfully, and may not have applied to the council for approval. Under such conditions, ask for information regarding the product from the Council on Dental Therapeutics. It would have much more professional significance if a pharmacist inquired of the council regarding the merits of a product offered for sale by the manufacturer, than to have a dentist write to the council asking for information about a product a pharmacist tried to sell him.

The council on Dental Therapeutics asks only that a product have some scientific or therapeutic reason for existence. The American Dental Association published a list of Accepted or Non-Accepted drugs and preparations. The reports of the council of Dental Therapeutics should be a source of information for the pharmacist. It is only through cooperation of the health service professions that a complete service may be rendered to the public.

A national organization of the proportions of the AMERICAN PHARMACEUTICAL ASSOCIATION has unlimited power in educational progress, in unification of licensing procedure, in improvement of the literature and encouragement of research, in classification of laws, and in all those tendencies and forces that converge to develop a unified profession that can best serve public welfare.

FORESIGHT IN PROFESSIONAL PHARMACY *

BY ERNST T STUHR ¹

INTRODUCTION

It is unfortunate that pharmacy as a profession has been overshadowed by too much emphasis on the commercial aspects. This encroachment has submerged the dignity of pharmacy and has brought ridicule from allied professions. The problems of a profession concern every member of the profession. It is imperative that all pharmaceutical organizations take heed of this condition and take steps to remedy the situation.

The reputation and prestige of pharmacy among the respected professions is at stake and it depends materially on the training the future pharmacist receives whether pharmacy can cope with present-day demands. This training entails a broad foundation of general knowledge as well as intensified specialization coupled with an abundance of practical apprenticeship in an ethical pharmacy. This apprenticeship should be the culmination of a constructive, cooperative, not competitive, program, between institutions and practicing pharmacists.

Professional experience obtained in the prescription department of an ethical pharmacy has no substitute. Schools and colleges which do not, or cannot, establish a coordinating relationship with health service dispensaries are handicapped in perfecting this vital experience which is an essential prerequisite for the educated pharmacist.

PROFESSIONAL RELATIONSHIP OF THE PHARMACIST TO THE MEDICAL SCIENCES

Efficient medical service is the key-note pursued actively by the medical profession. Professional pharmacy constitutes an integral part in the efficient functioning of medicine and, as such, has a very definite and responsible duty to perform in the Nation's health program. In order to fulfil these obligations effectively, a pharmacist should endeavor to excel in both the theory and practice of his profession.

Functions of the Pharmacist—As the custodian of medicines, the functions of the pharmacist are many-fold.

1 The dispensing pharmacist has the responsibility of preparing, compounding and dispensing with efficiency and dispatch.

2 He must assure purity and quality of the products used. This involves a comprehensive knowledge of the medicinal substances prescribed.

3 He must be thoroughly familiar with all modern remedies and their therapeutical virtues which require a knowledge of synthetic chemicals, biological products and a fundamental acquaintance with scientific research.

4 He must be acquainted with proper methods of standardizing as well as with specific means of storage to retain stability. This is necessary because many of the products are complex and delicate compounds which require special care.

5 He is the final distributor of medicinal products for the sick. This requires strict professional integrity, and is a duty which cannot be undertaken lightly.

* Section on Practical Pharmacy and Dispensing. A. Ph. A., Portland, Oregon meeting 1935.

¹ School of Pharmacy, Oregon State College, Corvallis.

An adequate knowledge of, and ability in, the above, will help a practicing pharmacist to be of invaluable service to the physician and to the community in which he is practicing. The care with which he attends to these details will do a great deal toward elevating the respect of pharmacy as a profession.

The Hospital Pharmacist—The duties of the hospital pharmacist are two-fold

1. Functioning as a competent pharmacist
2. Acting as a scientific "information bureau" to the hospital medical staff and nurses

It is a vital necessity for every large hospital (in order to insure proper control of medical supplies) to maintain an adequate dispensary supervised by a competent pharmacist. Because of his fundamental training and practical experience, the hospital pharmacist should possess a background of knowledge which will enable him, or her, to contact the medical staff with professional confidence. This qualification can be attained by keeping abreast of the latest scientific developments in the fields of medicine and pharmacy. This is a paramount issue for the dispensing pharmacist. Reading is a potent factor.

PHARMACEUTICAL EDUCATION

The proper prescription for training future pharmacists includes a study and recognition of the increasing needs and demands of the public as well as keeping abreast of current pharmaceutical and medical advances. Intensified efforts to constructively develop the mental abilities and capacities of selected students in the direction of professional ideals is a paramount duty of our institutions, thus informing and developing the profession of pharmacy as to growing responsibilities. The social and educational problems must go forward hand in hand.

Proper training of the pharmacist in compounding and dispensing involves not only adequate instruction in fundamentals which are available in recognized institutions, but also practical experience (apprenticeship) in ethical prescription stores, hospitals or public dispensaries.

These latter facilities, however, are not always available should the college or school be remotely located from populated regions of the country. In those institutions which do not have access to the proper channels for practical experience, special courses may be developed to supplement the natural environments to obtain this fundamental professional experience.

A number of schools maintain "model drug stores" for instructional purposes, primarily for the development of the commercial phases of the drug business. These stores have become invaluable adjuncts for the inexperienced student. In addition to giving the student commercial training, these "model drug stores" could also be used for training in the professional side of pharmacy. The prescription department of these stores could be used as a true basis for professional training in prescription compounding. It need not be operative from a dispensing viewpoint in order to be useful, hence would not be competitive. This department should be stocked with medicinal products currently prescribed by the practicing physicians. The students could make a survey of local operating drug stores and make a study of current prescriptions with the objective in view of keeping a proper stock in the prescription department of the "model drug store." This phase of the store could then be correlated with the respective courses in operative pharmacy where the

student has an opportunity to prepare and study the various classes and types of preparations commonly prescribed by the medical profession

The use of the "model drug store" for practice in both commercial and professional pharmacy would be valuable preparation for a student's apprenticeship in an actual situation and would be a means of showing the student the true relationship between commercial and professional pharmacy. The method suggested would also give the student an opportunity to get first-hand information on drugs which are in constant use and which are used only rarely, this would be valuable from a practical standpoint.

It is imperative that the schools give a standard of instruction that will prepare the future pharmacist to be resourceful and competent to meet the demands of the medical profession and the advances of research. Without this objective professional pharmacy cannot long endure. This means a better understanding and recognition of the present-day needs.

The elevation of the standards of pharmaceutical education in the United States during the past twenty years has been phenomenal. Practically the entire effort has been concentrated on undergraduate pharmaceutical training, the quality of which now compares favorably with that of any country.

In the majority of communities the ratio of pharmacists to the population is too high. The rate of increase in the profession continues greater than the rate of increase in the population. The great need of the country is for better, not more, pharmacists, and for opportunities by which those in practice and those who are qualified can prepare themselves adequately for their responsibilities to the public.

AMERICAN PHARMACEUTICAL ASSOCIATION AT THE TEXAS CENTENNIAL EXPOSITION DALLAS

A recent issue of the Dallas Chamber of Commerce states that six national conventions will send more than 1000 members of the pharmaceutical profession to Dallas during the TEXAS CENTENNIAL EXPOSITION, which opens June 6th.

Of especial interest to the profession will be the medical and health display in the United States Building. This exhibit will be placed by the Federal Government at a cost of some \$40,000.00. Elaborate displays of private corporations showing the latest in pharmaceutical equipment, supplies and methods, will be found in the Hall of Varied Industries on the CENTENNIAL grounds. In addition there will be interesting exhibits of other kinds throughout the grounds.

Meeting simultaneously during the month of August, the half dozen parleys will draw members from all parts of the country. Nationally prominent speakers will take an active part in the business meetings.

Dallas pharmacists are planning many special events and amusements for visitors and their families. These include sporting and social events, as well as visits to the EXPOSITION itself.

Meetings scheduled are those of the National Conference of Pharmaceutical Association Secretaries, National Conference of Pharmaceutical Research, American Association of Colleges of Pharmacy, National Conference of Pharmaceutical Law Enforcement Officers, National Association of State Boards of Pharmacy, Plant Science Seminar and the AMERICAN PHARMACEUTICAL ASSOCIATION.

Definite dates for the sessions will be announced later.

THE DEPARTMENT OF THE AMERICAN ASSOCIATION OF COLLEGES OF PHARMACY

G B JORDAN—CHAIRMAN OF EXECUTIVE COMMITTEE, A A G P, EDITOR OF THIS
DEPARTMENT

I have been asked to write an editorial for the following paper by Professor Fiero Whether you are a teacher of pharmacognosy or of some other course in a school of pharmacy, these papers deserve your attention

Professor Fiero's paper is on a subject of vital importance from more than one angle What is taught in any course will determine the interest (or disgust) aroused in the student, it may affect his rating with the state board examiners and it will affect his ability to succeed in related courses

Some of the results obtained from the questionnaire are surprising and it is regrettable that the author of this paper has not criticised them more severely There is bound to be a variation in our teaching but what a student in New York needs is not much different from what his cousin in Chicago or Los Angeles needs A student going to a second school for graduate work may experience a handicap by such variations in the content of our courses—C J ZUFALL

THE CONTENT OF A PHARMACOGNOSY COURSE

GEORGE W FIERO *

In the syllabi of a pharmacognosy course and various textbooks on the subject, one finds a vast amount of material under this general classification Of course, if one considers the original meaning of *pharmacognosy* (from the Greek *pharmakon* and *gnosis*—a knowledge of drugs), the amount of information which could be included is limited only by our present knowledge of pharmacy, pharmacology, phytochemistry, botany and allied sciences

The question which confronts the instructor is "How much of this information should the prospective pharmacist know?" The course is largely factual Educational authorities tell us that factual information is not long retained after the course is completed There are at least 26 points concerning each of over 300 drugs Should the student be required to commit all of this information to memory?

It would appear that the scope of the course might vary with the drug For example, an important drug such as opium or cinchona should be treated differently from some of the unimportant drugs Some instructors, however, treat them all alike The New York State Syllabus divides the drugs into primary and secondary lists Unfortunately, the amount of material to be taught concerning each of the drugs in the secondary group is too comprehensive Some of the district meetings of boards and colleges have prepared a list of drugs upon which the graduate will be examined It appears to the writer that it is far more important for the student to be entirely familiar with the important drugs at the expense of the unimportant ones

In order to ascertain what pharmacognosy professors think of the relative value of the several points of information, a questionnaire was sent to them Fifty-four replies were obtained, the results of the questionnaire may be seen in the accompanying table

* University of Buffalo School of Pharmacy

?? — 2									

* Some—considered important in certain drugs, in others not important

¹ O C—taught in some course other than pharmacognosy

A majority of the professors concluded that the following points are important, they are arranged in order of relative importance

Latin and English Title, Official Synonyms, Part Used, Botanical Source, Dose, Standard of Strength, Macroscopic Description, Therapeutic Properties, Family Name, Preservation, Non official Synonyms, Constituents, Standard of Purity, Adulterants and Preparations

A majority considered the following unimportant

Detection of Adulterants, Microscopic Description, Powdered Drug Description, Abbreviation, Habitat, Marketing, Ash, History and Plant Description

Even though a large majority (52 of 54) pharmacognosists agree as to the importance of the botanical source, the writer takes exception to its value. In other than a few isolated cases, he will never use the botanical source of a drug, will never come in contact with it in dispensing or in selling drugs and preparations. It appears to be a great waste of time and energy to learn over 300 tongue-twisting Latin names when this time could be put to a much better advantage in learning more about the active constituents of the important drugs so as to be able to predict incompatibilities in dispensing. The student should understand the taxonomical relationship of the botanical names and their value in the U S P from a legal standpoint.

In the case of such things as the descriptions, macroscopic, microscopic and powdered, the standard of purity, the per cent of ash, etc., it appears rather foolish to learn all of these points of the U S P or N F monograph. They are of value for the determining of identity and quality of the drug. The student, on the other hand, should be thoroughly acquainted with the terms used in the descriptions so that he could identify a drug from the official description. The same is true with regard to abbreviations. The pharmacist does not *write* prescriptions, therefore, he should not be required to learn verbatim abbreviations, but should be able to recognize the abbreviation when he sees it in a prescription.

HISTORY OF SCIENCE SOCIETY

Program of St. Louis Meeting

President, C. A. Browne, Washington, D. C., *Secretary*, F. E. Brasch, Library of Congress, Washington, D. C.

Thursday Morning, Joint Session with Section on Historical and Philological Sciences (L) and Academy of Science of St. Louis, January 2nd, Mayfair Hotel

The symposiums are as follows: "Study and Teaching of the History of Science," *Chairman*, George Sarton. "Early Science in St. Louis Area," *Chairman*, Chauncey D. Leake.

Among the participants are: H. T. Davis, Indiana University, L. C. Karpinsky, University of Michigan, U. G. Mitchell, University of Kansas, Robert S. Woodbury, Massachusetts Institute of Technology, Charles A. Morris, University of Chicago, Benjamin Ginzburg, Washington, D. C., H. L. Gordon, New York, N. Y., Harcourt Brown, Washington University, Solon Buck, The National Archives, Washington, D. C., C. A. Brown, *Retiring President*, Robert E. Schlueter, St. Louis, William H. Roever, Washington University, Joseph Grindon, St. Louis, Chauncey D. Leake, University of California Medical School, A. B. Hertzman, St. Louis—"William Beaumont—a Photographic Record," Jesse Greenman, Missouri Botanical Garden, Charles F. Sherwin, St. Louis.

Many of the subjects discussed are of interest to pharmacists, the paper by A. B. Hertzman is referred to, because the late H. M. Whelpley presented a paper on the subject, published in the PROCEEDINGS A. P. H. A., for 1903, pages 560-565. It also deals briefly with research on Pepsin.

THE NEW U S PHARMACOPŒIA, ELEVENTH REVISION

The U S P Board of Trustees has announced December 16, 1935, as the date for the release of the U S P XI, and June 1, 1936, as the date when its standards shall supersede those of the U S P X. The following comments are abstracted from statements made by Chairman E Fullerton Cook, of the Committee of Revision

'In presenting this Revision of the Pharmacopœia to the Country the Committee does so with the confident belief that its scope and standards conform to the objective established by the 1930 Pharmacopœial Convention and that it fulfils the present-day needs in its field for both Medicine and Pharmacy. Interim Revisions' with possible annual supplements have been announced by the Board of Trustees "

It may be interesting to note that the U S P XI contains 565 titles of which about 430 have approved therapeutic usefulness although many have similarity in action such as the various quinine salts, the iodides, the bromides the barbiturates etc. The remainder are pharmaceutical necessities, including many crude drugs not administered themselves but employed to make dosage forms of medication. These must necessarily be standardized "

'In the list of admissions will be found 131 pharmaceutical formulas, approximately 30 per cent of the list of therapeutic agents. Most of these formulas can be prepared in the retail pharmacy. Among these are cerates, waters, elixirs, extracts, fluidextracts, liniments, solutions, masses, compound powders, spirits, suppositories, syrups, tinctures and ointments.

'The new spelling of sulfate, sulfur, etc. conforming to modern usage may seem strange at first, most of the changes seem logical, such as the adoption of the universally used 'Saccharin' the use of 'Posterior Pituitary' in place of 'Pituitary' necessitated by the use to-day of the whole gland and of the anterior lobe. Other changes may seem strange, for instance the Food and Drug Administration asked that 'Compound Powder of Glycyrrhiza' become 'Compound Powder of Senna' to indicate the more potent constituent, and the physicians of the Committee insisted upon changing the title of 'Compound Mixture of Glycyrrhiza' to 'Compound Mixture of Opium and Glycyrrhiza'. In all of these cases, the synonyms remain and these products will probably always be known by the layman as 'Compound Licorice Powder' and 'Brown Mixture' respectively.

"The development of two advisory Boards dealing with the standards for vitamins and for Anti Anemia Products are valuable new features. The Vitamin Board, having among its members Dr Mendel of Yale University, Dr Sherman of Columbia University and Dr E M Nelson, Director of the Vitamin Laboratory of the Government has rendered an important service. The Vitamin A and D standards, developed by this Board, and announced officially by 'Interim Revision,' have already become universally adopted in this Country, and the 'U S P Reference Cod Liver Oil, of known vitamin potency, is being distributed throughout the world through the cooperation of the Vitamin Committee of the Health Organization of the League of Nations. The Vitamin Board is now conducting a series of studies of Vitamin B₁ Assay methods in which 26 laboratories in this Country and abroad are participating.

'The Anti Anemia Products Advisory Board consists of Doctors Minot and Castle of Harvard Medical School, Dr Isaacs director of the Simpson Institute of Ann Arbor, Dr Palmer of the Medical Center, New York City with Dr C W Edmunds, Chairman. This Board will indicate liver and stomach preparations which are of Pharmacopœial quality—as indicated by submitted clinical data. This is a new service for physicians which the Pharmacopœia is undertaking "

'International Relations—The U S P XI has adopted a number of International Standards such as those for Vitamins A and D and for digitalis and those approved by the last Brussels Conference. Throughout the revision the Committee has maintained a most friendly cooperation with the British Pharmacopœial Commission in an effort to harmonize the titles and standards of these two Pharmacopœias "

Percentage Solutions—A new feature is the suggestion among the General Notices of the U S P XI, page 4, that prescriptions calling for percentage solutions be prepared, when not otherwise directed, by dissolving the substance (if a solid) in accordance with the principle 'weight in volume'. For instance, for a 1 per cent solution, dissolve 4.5 grains of the substance in sufficient of the solvent to measure 1 fluidounce. This follows the custom of most pharmacists.

and also the precedent established by the latest British Pharmacopœia, and should establish a uniformity badly needed in prescription practice in this Country "

The Pharmacopœia XI will be on sale December 16th, and replace the Pharmacopœia X, hence all users of the Pharmacopœia will have opportunity for studying the former, therefore references will be made without comment, to items included in the statement by the chairman

"Alternative Formulas," "Reference Standards," "Some Important Revision Changes " "Increased Strength of Acids," "Ether for Anesthesia and Solvent Ether," "Biological Products," "Camphor and Menthyl," "Digitalis," "Emulsions," "Ephedrine," "Ergot," "Bichloride Tablets," "Liver and Stomach Anti-Anemia Preparations " "Solution of Magnesium Citrate," "Ipecac," "Fowler's Solution," "Solution of Sodium Hypochlorite," "Quinine Sulfate," "Sodium Phosphate," "Sapo Durus," "Sapo Molli," "Glycerin Suppositories," "Antiseptic Iodine Solution," "Tryparsamide," "Ointments," "General Tests, Vitamin Assays, Reference Standards, Reagents, Tests and Standard Solutions, Hydrogen-Ion and Tables," "Color Standards "

The Committee of Revision and Associates Under the subhead of the Chairman's Statement, the closing paragraphs are quoted in full

"When Dr Lyman Spalding, on February 28, 1818, issued a call for voluntary assistance in the preparation of a Pharmacopœia for the United States, he characteristically described the type of professionally minded and trained scientists who could or would cooperate in the making of a Pharmacopœia He said they would have to be 'gentlemen, willing to act and men distinguished for their ability and learning' "

"In this day when intensive commercialism, selfishness and personal ambition largely influence many men, even those associated with the traditionally altruistic professions of medicine and pharmacy, it is gratifying to find those standards of Dr Spalding, announced one hundred and eighteen years ago, so splendidly realized The willingness to assume large responsibility by men distinguished for their ability and learning and the continuous and untiring labor of years during those extra hours which were not demanded for their regular, exacting duties, alone make possible a publication like the U S P

"Among the members of the Pharmacopœial Board of Trustees, the Committee of Revision, the auxiliary boards and associated scientists will be found the names of men and women known internationally for their contributions to the latest developments in the medical and pharmaceutical sciences Only the voluntary service plan of the Pharmacopœia could command the help and association of those forming this distinguished group "

John Uri Lloyd, president of the AMERICAN PHARMACEUTICAL ASSOCIATION, 1887-1888 and aged 86 years, in writing to the Remington Medahst, S L Hilton, said that "things were becoming monotonous " so he with his daughter and son-in law, Dr Welbourn of Los Angeles, visited Japan While there, he was delightfully entertained, among the hosts Hajime Hoshi who has made a return visit

The latter is head of the Hoshi Pharmaceutical Co Ltd, Tokyo, Japan, which from a small beginning now owns and controls the greater number of retail stores in Japan and owns the Formosa quinine area

Mr Hoshi credits the rapid growth of his pharmaceutical manufacturing and retail selling organization to the careful training of its

sales representatives and factory executives, in this training, the Hoshi Commercial School in Tokyo plays an important part Here, from 150 to 200 young men who desire to enter the pharmaceutical profession are trained under competent instructors, not only in the profession of pharmacy, but also as expert salesmen and factory supervisors

To encourage young men to enter the profession of pharmacy, a selective plan is employed to provide group managers and factory supervisors A record is kept of their graduates from the time they enter the school and all through their work in the field The men who show themselves to be best fitted for this type of work are promoted to the higher executive positions

A Joyful Christmas and a Successful
New Year.

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and Branches shall become the property of the Association with the understanding that they are not to be published in any other publication prior to their publication in those of the Association, except with the consent of the Council"

—Part of Chapter VI, Article VI of the By-Laws

ARTICLE III of Chapter VII reads "The objects and aims of local branches of this Association shall be the same as set forth in ARTICLE I of the Constitution of this body, *and the acts of local branches shall in no way commit or bind this Association and can only serve as recommendations to it* And no local branch shall enact any article of Constitution or By-Law to conflict with the Constitution or By Laws of this Association "

ARTICLE IV of Chapter VII reads "Each local branch having not less than 50 dues paid members of the Association, holding not less than six meetings annually with an attendance of not less than 9 members at each meeting, and the proceedings of which shall have been submitted to the JOURNAL for publication, may elect one representative to the House of Delegates "

Reports of the meeting of the Local Branches shall be mailed to the Editor on the day following the meeting, if possible Minutes should be typewritten with wide spaces between the lines Care should be taken to give proper names correctly and manuscript should be signed by the reporter *Please advise us of changes in Roster and mail reports promptly*

BALTIMORE

The regular monthly meeting of the Baltimore Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held on December 12th at the Hotel Emerson The meeting was called to order by President Wm F Reindollar A short business meeting was held prior to the introduction of the speaker of the evening

The secretary read a communication from Dr A Zieffle, chairman of the Committee on Local Branches of the AMERICAN PHARMACEUTICAL ASSOCIATION concerning the pending matter of the allocation of one dollar yearly by the parent organization to the Local Branches for each member, the annual dues of the Local Branches to be dispensed with It was moved and seconded, "that the Baltimore Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION go on record as approving the recommendation before the Council concerning the rebate of one dollar per member for Local Branches" This motion was approved Chairman Zieffle will be informed of the action taken in this matter

The secretary read further in Dr Zieffle's letter concerning membership in the Local Branches as restricted to members in the parent body Since it has been the custom for years in the Baltimore Branch to admit to membership non members of the A PH A , it was moved by the secretary and seconded 'that the Baltimore Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION formally extend the privilege of membership to non members of the AMERICAN PHARMACEUTICAL ASSOCIATION Such members to pay the yearly dues of one dollar and further that the Baltimore Branch attempt to interest all such local members in membership in the parent organization " Approved

The secretary read communications from Dr Ernest Little, Dr E F Kelly and the report of the Committee on Resolutions of the A PH A as submitted at the Portland Meeting No action was taken by the Branch concerning these communications

New business introduced at this meeting was as follows In view of the fact that the officers of the Branch have for the past several years been totally unsuccessful in arranging program meetings that attracted an attendance of members that was not embarrassing to the speaker and members present and because very few retail pharmacists ever attended the meetings, the following motion was made 'That the President appoint at this meeting, a special committee of three active members of the Branch to present before this organization at the next meeting a report of a survey of the membership to consist of the following—To determine by vote the advisability of dissolving the Baltimore Branch of the A PH A , if this is not advisable to determine if possible, what type of meetings and how many a year are desired by the membership ' " It was moved by Carr, seconded and carried President Reindollar appointed to this special committee C Jelleff Carr, *Chairman* Glenn L Jenkins and Simon Solomon President Reindollar

dollar appointed as the chairman of the Nominating Committee, Simon Solomon, the two other members of this committee are to be selected by the chairman

President Reindollar introduced the speaker of the evening, Dr W C Harden, Research Chemist, Hynson, Westcott and Dunning, Baltimore, Md Dr Harden selected for his topic "Organic Antiseptics with reference to Structure, Physical and Bactericidal Properties" The speaker gave a brief review of the history of antiseptics pointing out the compounds that were first used as germicides and stated that he would limit his discussion to those compounds related to the aromatic phenols It was shown how the chemist starting with simple alkyl phenols prepared vast numbers of substances related to the alkyl resorcinols and the alkyl phenolic ethers and how the remarkably high phenol coefficients of modern antiseptics are achieved Dr Harden described the studies on the effect of alkyl groups on bactericidal activity when combined in phenolic compounds the effect of molecular weight on bactericidal activity and how salt formation rendered these extremely potent compounds practically inactive Finally, he raised such interesting questions as, does the molecular weight or physical property of a compound play the most important part in determining bactericidal action? And how can the chemist prepare compounds that are destructive to bacteria and still harmless to humans? A general discussion followed A rising vote of thanks was tendered Dr Harden

C JELLEFF CARR, *Secretary-Treasurer*

ORGANIZATION OF STUDENTS' AUXILIARY OF THE MARYLAND PHARMACEUTICAL ASSOCIATION AT THE SCHOOL OF PHARMACY OF THE UNIVERSITY OF MARYLAND

At the annual convention of the Maryland Pharmaceutical Association held in June 1935 the Constitution and By-Laws of the Association were amended to provide for a Students' Auxiliary to be organized at the School of Pharmacy of the University of Maryland

This Students' Auxiliary is formed for the purpose of familiarizing students of pharmacy with the conditions existing in and problems confronting their profession, to promote closer contact between the pharmacist and the student of the profession, and to provide early training in organization work

The first meeting was recently held at the School of Pharmacy, with Dr M R Thompson Professor of Pharmacology as the presiding officer Dr Glenn L Jenkins, Professor of Pharmaceutical Chemistry, presented a short history of the Maryland Pharmaceutical Association and the purpose of the Students' Auxiliary Constitution and By-Laws were adopted

The following are the officers for 1935-1936 *President*, P H Thompson, *First Vice President*, J R Karns, *Second Vice President*, W Gakenheimer, *Secretary* Miss S Glickman, *Treasurer*, R Thompson, *Editor*, R V Robinson *Executive Committee* A Tramer, G A Mouat, G Kelley, M R Thompson Frank J Slama

The members of the Students' Auxiliary will regularly receive the monthly publication of the Maryland Pharmaceutical Association—*The Maryland Pharmacist*

CHICAGO

The regular monthly meeting of the Chicago Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held November 22nd, at the University of Illinois College of Pharmacy

The speaker of the evening was H S Noel, Assistant Director of the Advertising Department of Eli Lilly & Company, and Editor of *Tile and Till* Mr Noel spoke on "The Future Outlook for Financial Success in Pharmacy"

At the opening of the meeting Mr Emig, of the University of Illinois College of Pharmacy gave a review of the outstanding articles in the last JOURNAL OF THE A P H A

This report was well received and called for many discussions from the audience

Mr Noel began his discussion by contrasting in retrospect the years 1935 and 1900 A store in one town that did \$3750 00 business in 1900 did \$14 000 00 worth of business in the year 1935 This shows that the diversity of items sold in the drug stores to day has greatly increased the volume of business He stressed the value of the personality of the owner and clerks in building up and retaining business

The Lilly Drug Store Survey was begun in Virginia in 1922 In 1932 there were 272 reports from retail druggists as compared to 402 in 1933 and 394 in 1934 Mr Noel reported

that the greatest trouble found in getting reports from the druggists was that they do not keep accurate and complete business records, or in many cases none at all

Figures were shown that would leave the owner of the average store a net return of 6% on sales. The faults named as the cause for this low percentage of profit were, the high cost of merchandising and the lack of proper control over drug store expenses. It was added that profit can be lost through carelessness and through inability to get a turnover on merchandise.

Nine essentials were named as a prerequisite to a profitable drug store. They are:

- 1 Importance of a buying budget
- 2 Importance of an annual inventory
- 3 Orderly and clean stock
- 4 Accurate records
- 5 Daily verification of sales and expenses
- 6 Importance of taking cash discounts
- 7 Avoidance of wastes
- 8 Trained help and allocation of responsibility
- 9 Concentration of purchases to a few sources of supply

At the conclusion of the discussion Mr Noel answered many questions and gave added information to those interested.

LAWRENCE TEMPLETON, *Secretary Treasurer*

NEW YORK

The November 1935 meeting of the New York Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held November 11th at the College of Pharmacy, Columbia University. About forty-five members and their guests were present.

The secretary read the report of the October meeting and the report of the special meeting in Washington, the occasion of the Remington Medal presentation to Dr Samuel L. Hilton. Both reports were accepted.

Chairman Lehman of the Committee on Legislation and Education, rendered the following report:

National Legislation—As the United States Congress is due to convene in two months and the Legislative Machinery is being set in motion as far as pharmaceutical interests are concerned the following program is being organized:

An enabling act is being sponsored by the National Association of Retail Druggists and allied organizations. This will amend the Clayton act as follows: "Provided that nothing herein shall render illegal contracts or agreements prescribing minimum prices for the sale or resale of a commodity which bears the trade mark, brand or the name of the producer or owner of such commodity and which is in fair competition with commodities of the same general class produced by others, when such contracts or agreements are lawful under any statute now or hereafter in effect in any state, territory or the District of Columbia in which such sale or resale is to be made and the making of such contracts or agreements shall not be an unfair method of competition under Section 45, Title 15 U. S. C."

This would permit resale price agreements in such states as have passed Fair Trade Laws. It will be introduced in the Senate by Senator Tydings, Maryland.

The Patman Bill will be reintroduced, which provides that no special or quantity discounts shall be allowed which are not given on all purchases large or small.

The Copeland Pure Food and Drug Law will come up again perhaps in a slightly altered form, and it is hoped that it will pass this time.

Every employer of eight or more persons is subject to the new Pay roll and Wage Taxes. On and after January 1, 1936 for the Calendar year 1936 the tax is 1%. 1937, 2%, after December 31, 1937, 3% on the Wage Tax. The Pay-roll Tax only becomes effective on January 1, 1937, and starts with 1%, with graduations every three years until it reaches 3%. These assessments are designed to provide old age pensions etc., in the future.

Every manufacturer of Toilet Preparations must make monthly returns in duplicate to the Bureau of Internal Revenue, and pay a 10% tax. This includes all non official preparations also mixtures of official drugs, such as, for instance, Rose Water and Glycerine. The list embraces

Hair Tonics, Hair Restorers, Hair Dyes, Wave Setting Fluids, Rouges, Face Powders, Face Lotions, Skin Cleansers, etc., etc

The Federal Trade Commission is proceeding against manufacturers of inferior rubbing alcohols, especially where such compounds do not contain ethyl alcohol as a base, or where the ethyl alcohol content is negligible. Several Chicago concerns have agreed to cease and desist.

The New York State Fair Trade Law is gaining more support on the part of wholesalers and manufacturers daily. Over fifty manufacturing firms have agreed to issue contracts which have now been approved by the Fair Trade Committee of the New York State Pharmaceutical Association, and seven wholesalers have prepared omnibus contracts.

Fredrick C. A. Schaefer, Branch delegate to N. Y. Pharmaceutical Council, reported that a great mass meeting of retailers had been held on October 28th, to discuss ways and means of encouraging manufacturers and retailers to sign the Fair Trade Contracts. The meeting was a great success, being attended by about 2000-2500 persons.

Chairman Steiger, of Progress of Pharmacy Committee, reported the following:

"A short paragraph in *Lilly's Tile and Till* is devoted to cyanide poisoning. It is stated that 243 deaths were recorded by cyanide poisoning in 1931 and that this figure rose to 416 in 1933. The new method of reviving persons who have taken cyanide consists of successive injections of sodium nitrite and sodium thiosulphate into the patient's veins. This combination is reported to be ten times as effective as methylene blue."

Most suicides do not choose a too certain death and the proportion using cyanide will probably increase as the news of these new antidotes is published.

The *Oil, Paint and Drug Reporter*, for October 28th, reports that chlorophyll made in the United States is now offered commercially by "American Chlorophyll Inc.," Washington, D. C. The company is also offering to the food and drug industries Carotene and Xanthophyll, as well as combinations of the three chloroplast pigments. For some time the company has been supplying these products to universities and laboratories for scientific use.

The *Oil, Paint and Drug Reporter*, of November 4th, announced that George Brean & Co., pharmaceutical manufacturers of Kansas City, has been given the decision in a suit against it by the Wisconsin Alumni Research Foundation, alleging infringement of a patent on the use of copper with iron in the treatment of anemia. The basis of the Court's decision was the conclusion that the subject matter of the Hart patent had been anticipated by numerous foreign publications dating back to articles by L. Mandini of Venice in 1862.

The *Drug Trade News*, of November 11th, reports that Spencer Kellogg & Sons, Inc., have developed a castor oil which, it is claimed, will not offend the most delicate sense of taste and smell.

In a paper read before the American Public Health Association, Drs. Robinson and McKahn reported that purified placental extract prevents measles. In many ways, Dr. Robinson points out this means of combating measles is merely the revival of an old heathen custom. Many centuries before the present development in medicine, it was customary to dry the placenta. If a child became ill, he might be given some of his own placenta.

A new, economically produced skin disinfectant, known officially as "a compound alcoholic solution of mercuric chloride" has been developed by two investigators at the University of Illinois, Department of Bacteriology and Health. It is reported to contain 50% ethyl alcohol, and varying proportions of acetone, mercuric chloride, hydrochloric acid, chrysodine and distilled water. It is described as 350 times as powerful in killing germs as phenol, three times as powerful as tincture of iodine, etc., and other widely used skin disinfectants, it is said to be easily prepared. Each ingredient was added for a definite purpose. The alcohol serves to increase penetration, acetone to remove fats always present on the skin and coloring matter was added to show the "field" or area of skin covered by the disinfectant.

Under the heading of old business, the secretary referred to the letter received from the Comptroller's office of the City of New York. After a brief discussion it was decided to leave the matter as is.

Dr. Ballard then reported that cards, urging the election of two Branch members, namely, Dr. J. Leon Lascoff and Dr. Robert P. Fischels to offices in the A. P. H. A., had been mailed to all Branch members.

Under new business, Dr. Ballard suggested that a letter of thanks be sent to Augustus C.

Taylor, Washington, for arranging the successful dinner in honor of Dr Hilton This was placed in the form of a motion by Dr H V Army, duly seconded and approved

A communication from Dr Ernest Little was then read This called attention to Dr Little's article on increasing ASSOCIATION membership, which was recently published in the JOURNAL

Before proceeding to the Scientific Session, President Ballard called attention to the fact that the next Branch meeting would be held in the Brooklyn College of Pharmacy Long Island University

Dr Ballard then introduced the speaker for the evening, Dr Louis Faugeres Bishop Jr, who spoke on 'Coronary Artery Disease' An abstract of Dr Bishop's address follows

In the general problem of heart diseases, that of the coronary artery is the most important part The oldest case on record for this type of heart disease is that of Buddha in 400 B C Coronary thrombosis is a frequent cause of death among the higher intellectual groups, and the death of former President Coolidge as well as Billy Sunday was due to coronary thrombosis

Methods of prevention center around a better understanding by the layman of the causes and consequences Coronary thrombosis is on the increase and this is likely due to the present type of life Although most cases occur in people past middle age younger people have also suffered

Before continuing with his address, Dr Bishop showed a motion picture film of the human heart He pointed out the two coronary arteries, which supply blood to the heart The motion pictures were really remarkable in that they very plainly showed the heart action through two complete cycles in which each step was being recorded on a graph by means of the electrocardiograph The electrocardiograms of both normal and pathological heart conditions were shown

Continuing with his discussion, Dr Bishop stated that in pathologic conditions the left coronary artery was the most important The patient begins to complain of pain, after eating, exertion, emotion or excitement This pain *Angina pectoris*, is of course, a symptom and not a disease The pain may run from heart to left arm, to the teeth, to the abdomen and to the chest Numerous conditions can bring on this pain, and in this connection Dr Bishop cited some interesting cases from his own experiences

There are many theories explaining the cause of *Angina pectoris* and best opinion indicates that the deficient blood supply to the heart is responsible

Sometimes persons suffering from coronary artery disease, show no history of pain, but complain of shortness of breath, others experience vague stomach symptoms and in some cases no symptoms at all are noted, and the pathologic condition can only be discovered by means of an electrocardiograph

Now the symptoms just discussed indicate an incomplete obstruction in the flow of blood to the heart muscle An accident may occur and bring on thrombosis when the supply of blood to one part of the heart is cut off In this case continuous pain is experienced Shock results the blood pressure falls and treatment for shock must be immediately instituted

Thrombosis occurs usually in individuals between 50 and 60 years of age However, Dr Bishop mentioned that he had seen cases in patients from 34 to 70 years of age It occurs more in males than in females, the proportion being about 3 or 4 to 1 Occasionally it is difficult to recognize thrombosis and early diagnoses have sometimes proved to be false Coronary thrombosis usually occurs in the left descending branch of the coronary artery Since the heart is supplied by two arterial branches a block in one does not completely cut off the blood supply to the heart muscle The portions of the heart supplied by each branch were carefully shown in lantern slides It was pointed out that there are portions of the heart muscle supplied by both arterial branches

The importance of comparative records, before and after an attack of thrombosis was especially emphasized

In discussing treatment Dr Bishop divided the procedure into two parts, one before thrombosis, the other after coronary thrombosis

1 *Before Thrombosis*—The examination of patient and placing him under a physician's care already serves to improve the patient Drugs, as nitroglycerin, are especially recommended

and the patient should carry some with him for emergency use. The life of the individual should be regulated to avoid emotion and excitement. Diet does not require regulation as to kind but as to quantity, less should be eaten at one time. The purine drugs, as Theophylline and Theobromine and their salts, find a place but it is sometimes difficult to evaluate their benefit.

2 *After Coronary Thrombosis*—The treatment is different. A long period of rest must follow. Recovery from the first attack occurs in 80-85% of the cases. A spirit of optimism must be instilled in the patient. New blood vessels form in the heart and patients have lived 17 years after the first attack.

After a severe attack the treatment for shock is most important. For this morphine is very valuable, occasionally, oxygen is also employed.

Finally, in discussing future prevention, Dr. Bishop called attention to the health rules laid down by Commissioner Rice. These rules emphasized better living, more rest, less cocktails, avoid nervous excitement, learn to relax and how to spend leisure time free from worry and excitement.

President Ballard thanked the speaker for his lucid and understandable discussion and asked the audience if there were any questions.

Dr. Bilhuber responded by asking the speaker the place of digitalis, caffeine and alcohol in the treatment of coronary artery disease.

In reply Dr. Bishop stated that digitalis requires careful use. In congestive heart failure, digitalis is useful. It is usually not used after coronary thrombosis. Alcohol has a definite place, being useful in *Angina pectoris* where it acts like nitroglycerin. Its danger lies in the coincidental reactions as stimulation of appetite with danger of overeating. It is a mistake to deprive older people of alcohol. Caffeine is the best stimulant for shock. Dr. Bishop claimed no experience with the use of caffeine in *Angina pectoris*.

Dr. Lascoff asked a question concerning the use of adrenalin. In reply Dr. Bishop stated that the blood pressure falls far and fast in coronary thrombosis. In such cases adrenalin helps to get over the critical or shock period, it should be used with care.

Answering several other questions, Dr. Bishop stated that he had had no experience in the use of calcium for coronary artery disease, and that false or pseudo *Angina pectoris* was simply a general name applied to pain in the chest which might be due to a variety of causes.

There being no further questions, a rising vote of thanks was accorded the speaker and the meeting adjourned.

RUDOLF HAUCK, *Secretary*

PHILADELPHIA

The December meeting of the Philadelphia Branch AMERICAN PHARMACEUTICAL ASSOCIATION, was held in the auditorium of the Philadelphia College of Pharmacy and Science, December 10th, E. H. MacLaughlin presiding.

Donald C. A. Butts, director of the Emery Laboratories of Cancer Research, and affiliated with the Philadelphia College of Pharmacy and Science, Saint Luke's and Children's Hospitals of Philadelphia was introduced as the guest speaker. He spoke on "The Past, Present and Future of Cancer Research," and gave the high lights of the advances made in cancer research from the year 1500 B. C. to the present day. A brief discussion of some of the more important theories and researches on cancer was presented.

Mr. Butts pointed out that cancer was definitely on the increase. He enumerated upon the three most effective weapons against cancer, namely Surgery, radium and X-ray treatments, lantern slides and moving pictures were shown to illustrate how cancer researches were carried out.

The meeting was then thrown open for discussion, and Dr. Frederick James, professor of Histo Pathology and director of the Isaac Dorr Research Laboratory of Temple University, School of Dentistry, lauded the speaker for his most interesting lecture.

GEORGE E. BYERS, *Secretary*

PITTSBURGH

A meeting of the Pittsburgh Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held November 9th.

The meeting was called to order, in the main lecture room of the Falk Clinic at 8 00 P M, by acting chairman, Frank S McGinnis

The minutes of the last regular meeting were read and approved

Mr McGinnis appointed the following nominating committee to report at the December meeting C T Van Meter, A F Judd and E C Reif, *Chairman*

A splendid report of the 83rd annual convention, held at Portland Oregon was presented by Delegate C Leonard O'Connell

The chairman called on Louis Saalbach to tell about the progress of the National Formulary revision Dr Saalbach, serving as vice chairman of the National Formulary Revision Committee indicated that the new N F would soon be ready for release

The past-presidents of the Pittsburgh Branch were called on in order and each contributed interesting information

The program of the evening was presented by the Department of Pharmacy of the University of Pittsburgh School of Pharmacy A demonstration was made by the staff members of the manufacturing equipment installed in the Pharmacy of the Falk Clinic

Among the new installations in the manufacturing department is a Colton 2 B single punch tablet machine, an ointment mill and complete equipment for filling and closing ointment tubes A twenty gallon tumble barrel is in operation together with all the equipment needed for granulating substances for tablets

Among the many interesting demonstrations was the apparatus used for filling tubes with ophthalmic ointment and the technique involved in preparing sterile solutions in bulk packages

A very entertaining and instructive program was presented by the Pharmacy staff

STEPHEN WILSON, *Reporter*

ST JOHN'S UNIVERSITY STUDENT BRANCH

The regular monthly meeting of the St John's University Student Branch of the AMERICAN PHARMACEUTICAL ASSOCIATION was held on Friday evening November 22, 1935 The meeting was called to order by the treasurer Andor Haeker who acted as chairman A group of fifty including members, students, guests and members of the faculty were present

The treasurer submitted a report covering the year 1934-1935 showing a balance of \$7 50

Dr Victor Fourman Chief Chemist of Campagne-Parento was introduced He announced as his subject

THE PRODUCTION AND USE OF OTTO OF ROSE

Dr Fourman dealt with the history of rose oil and rose water pointing out that according to one authority the province of Faristan was required to pay an annual tribute of 30,000 hottles of rose water to the Treasury of Bagdad as far back as 810 A D The town of Kazanlik " he said 'has been the center of the industry for the past 300 years " With the aid of a motion picture the lecturer then described the cultivation and harvesting of the roses and the apparatus used in the production of the oil He pointed out that nearly two tons of flowers were needed to produce one pound of oil

The chemical composition of the oil is very complex, pointed out Dr Fourman indicating that at least thirty constituents have been found and estimating that there might be twenty others present At this point Dr Fourman displayed an "original vase" of the Bulgarian oil, showing the government stamps and seals affixed Great interest was shown in this and in the lecturer's collection of pseudo rose oils The value of the oil varies greatly and depends on the amount of natural otto it contains, it was pointed out

In the discussion that followed the lecturer discussed the value of congealing point as a test for purity pointing out that since this factor varies even with pure oils it is of little use In discussing the quality of rose water sold in drug stores, Mr Orris pointed out that reputable manufacturers use natural otto in making the so called fluid rose soluble In answer to a question, the lecturer pointed out that in his opinion, there is no scientific explanation for the empiric practice of preserving rose water and stronger rose water by stoppering the hottles with a pledget of cotton

A rising vote of thanks was extended Dr Fourman and to Compagne Parento for the interesting lecture and demonstration

DOROTHY CIMAROSA, *Acting Secretary*

ASSOCIATION BUSINESS

AD INTERIM BUSINESS OF THE COUNCIL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 1935-1936

Office of the Secretary 2215 Constitution Ave , Washington, D C

LETTER NO 9

November 29, 1935

To the Members of the Council

53 *Flexible Leather Binding for N F VI* Motion No 12 (Council Letter No 8 page 1036) has been carried and the retail selling price is set at \$6 00 per copy

Dr Fischelis wrote as follows

"I am voting *no* on Motion Number 12 because I believe the price of the National Formulary and the U S P to the trade is too high You will recall that I recorded myself in the negative when the original price was voted on and I am voting *no* on Motion Number 12 for the same reason "

54 *Special Committee on Emblem* Motion No 13 (Council Letter No 8, page 1036) has been carried and the Mellon Institute is granted permission to use the A PH A emblem under the conditions mentioned

55 *Use of Text of N F* Motion No 14 (Council Letter No 8 page 1037) has been carried and Mr McClintock has been advised

56 *Election of Members* Motion No 15 (Council Letter No 8 page 1038) has been carried and applicants for membership numbered 44 to 101, inclusive are declared elected

57 *Meeting of the Council* All members of the Council have responded and a majority have indicated a preference for Thursday, December 5th as the date of the coming meeting Chairman Hilton has, therefore, called the meeting of the Council at the AMERICAN INSTITUTE OF PHARMACY on Thursday December 5 1935 beginning at 10 00 A M It is expected that a morning, an afternoon and an evening session will be necessary It is hoped that each member of the Council can arrange to be present

E F KELLY, *Secretary*

LETTER NO 10

December 10 1935

To the Members of the Council

The second meeting of the Council for 1935-1936 was held at the AMERICAN INSTITUTE OF PHARMACY, Washington, D C , on Thursday, December 5, 1935, beginning at 10 15 A M , in response to the call of the chairman and to the action of the Council (see Council Letters No 22 (1934-1935), Item 142, No 8 (1935-1936), Item 51 and No 9, Item 57) Morning afternoon and evening sessions were held and the following members were present Hilton Army Christensen Cook, Costello, Delgado DuMez Dunning Eberle, Fischelis, Hayman Holton Kelly, Philip and Swann

Messages were received from Walter D Adams, J H Beal and C H LaWall and on motion of Hayman Cook, the secretary was requested to express to these gentlemen the regrets of the Council that they could not be present

58 *Report of the Committee on Finance* Chairman Philip submitted a verbal report reviewing the financial status of the ASSOCIATION Disbursements under the budget for 1935 had been kept below appropriations in most instances and did not exceed receipts It had been necessary, however, to allow some bills to accumulate because of the low receipts from N F V and R B II for the year, because of the cost of completing the N F VI and because of the delay in issuing it The accumulated bills will be paid after the issuance of N F VI

Attention was called to the increased expense of the revision of the N F and to the difficulty of maintaining a balanced budget because receipts and expenses over a decade varied so greatly from the estimates The same difficulty was experienced with the YEAR BOOK and with the JOURNAL and it is expected that with the completion of the YEAR BOOK series in 1936 and with

the publication monthly in the A PH A JOURNAL of the material heretofore appearing in the YEAR BOOK, a more accurate budget for these publications can be worked out and maintained

The returns from dues had shown an increase and the committee believed that the ASSOCIATION had passed through recent conditions very satisfactorily

National Formulary—Particular attention had been given by the Committee to the finances of the National Formulary and to the recommendations of the Committee on N F as submitted in its annual report to the Council at Portland It was believed that the program of continuous revision as approved, will serve to largely equalize the previous variations in annual expenses over the decade and to stabilize the annual budget However, the annual receipts are greatest during the first years of the decade and gradually decline The suggestion that a fixed amount of the receipts from each copy of N F VI sold be set aside in a separate fund for N F revision and that this fund which should be estimated on the basis of copies sold during the preceding decade, should be budgetted equally over the decade, was approved as the best means of meeting the situation After the cost of production and the fixed amount for revision are deducted from the receipts, the balance will be equally divided, as heretofore, between the Research Fund and the Current Fund, so that $\frac{2}{3}$ of net receipts will be devoted to research and revision

(*Motion No 16*) After a general discussion of the proposal, it was moved by Costello that one dollar of the return from the sale of each copy of N F VI be allocated to the expenses of the Committee on N F and be placed in a separate fund for that purpose The motion was seconded by Philip and carried

Chairman Philip stated that on the basis of the sale of N F V, this special revision fund covered by Motion No 16 would amount to approximately \$50,000 00 or to about \$5000 00 per year over the decade On this basis, Chairman Gathercoal had, upon request, suggested the following general budget for N F revision for 1936

Clerical expenses	\$1100 00
N F bulletin	500 00
Supplies and miscellaneous	200 00
Chairman's traveling expenses	400 00
Publicity and exhibits	300 00
Investigation and revision	2500 00

(*Motion No 17*) After discussion, it was moved by Dunning that the budget for N F revision as suggested by Chairman Gathercoal be approved for inclusion in the ASSOCIATION'S Budget for 1936 with the understanding that only so much of the appropriation as is required or is available will be expended The motion was seconded by Army and carried

Committee on Research—The Committee on Finance approved the award for 1935-1936 of \$1500 00 from the Research Fund for research on the subject of tests and assays for (a) N F ampul solutions, (b) N F tablets, as recommended by the Committee on Research in its report to the Council at the Portland meeting (see A PH A JOURNAL August 1935, page 702, Item 136)

In this connection, Chairman Army called attention to the expectation, as expressed in the report that this grant will be renewed for a second or even a third year following the precedent that a comprehensive piece of research should be carried on for as long as three years if the results justified it There followed a lengthy discussion of the Research Fund and of the work of the Committee on Research with particular reference to whether the grants should be made for basic research or for research bearing directly on the N F

Although no action was taken, it was the general opinion that the present method of increasing the Research Fund, as separate from the N F revision fund, should be continued, that the Committee on Research should continue to recommend the research awards and that awards should be made in accordance with Article XII of Chapter IV of the By-Laws of the ASSOCIATION

Appropriations for the Section on Practical Pharmacy and Dispensing and for the Committee on Pharmacy Week—Chairman Philip stated that the Committee was not prepared to submit a report with respect to these appropriations as further information was to be furnished by the Section and by the Committee

Budget for 1936—Upon inquiry, Chairman Philip stated that the Committee on Finance was not prepared to submit the budget until definite action had been taken on several matters to be considered by the Council at this meeting and until the Committee was more fully informed as

to the probable receipts from dues, and from the N F It was expected that the budget would be submitted by mail later in the month

59 Sale and Exchange of Bonds Treasurer Holton stated that U S Treasury Bonds 2 $\frac{3}{4}$ %, 1945-1947, dated September 15, 1935, had been received for the following funds and placed in the Treasurer's safe deposit box (see Council Letters Nos 2, Item 19, and No 3, Item 21)

Endowment Fund	\$2000 00	Research Fund	\$7000 00
Centennial Fund	2000 00	Procter Memorial Fund	200 00
Life Membership Fund	6100 00	Remington Honor Medal Fund	100 00

60 Report of Committee on Publications Chairman DuMez submitted a verbal report dealing with the following subjects

A Ph A Journal—The arrangements for publishing the JOURNAL were reviewed, and after a general discussion the Committee was requested to obtain bids, as heretofore, on the publication of the JOURNAL for 1936, on motion of Fischelis Holton

Year Book, Volume 23—The manuscript for this volume is now completed and bids were being secured for its publication and distribution This volume covers the calendar year 1934 and will be the last issued Arrangements had been made to print 300 extra sheets of the Pharmaceutical Abstracts for 1935 and these can be supplied in bound form if desired

Pharmaceutical Abstracts—The original program was to print 32 pages of Abstracts in each issue of the JOURNAL (see JOURNAL, April 1935, page 332) On account of the larger number of Journals being abstracted and the improvement in the abstracting, it was necessary to increase the number of pages to 40 in recent issues and under this arrangement, the material is accumulating with the indication that 48 pages will be required if all available material is published Since March, the average monthly cost for the abstract pages and index, was approximately \$250 00 and the increase to 48 pages will raise the cost proportionately The annual cost of 48 pages is estimated as \$3600 00 for printing and \$900 00 for abstracting and editing, or a total of \$4500 00 which will require an increase in the budget for the JOURNAL

The possibility of decreasing the abstracts in number to avoid duplication with other abstract publications, and in space required, was considered at length and the Committee was requested to study this method of meeting the increasing expense The favorable reception of the abstracts in the monthly JOURNAL was noted and every effort will be put forth to make this section of greater service

(Motion No 18) It was moved by DuMez that 48 pages of Pharmaceutical Abstracts be published monthly in the JOURNAL beginning with the issue for January 1936 The motion was seconded by Hayman and carried

(Motion No 19) It was moved by Swain that a study be made of the possibility of saving expense by publishing the abstracts in a separate volume as originally suggested, to be sent only to those members requesting it, and also of the advisability of making a charge for the abstract journal The motion was seconded by Dunning and carried

Proposed Publication—In accordance with the motion under Item 142, JOUR A PH A August 1935, page 704 further information about the publication had been collected and submitted to the Committee on Publications with a questionnaire requesting an opinion on a number of basic questions However, a report was not available at this time on policy or budget, and it was suggested that the material submitted to the Committee be studied by the Council as a basis for action

The meeting then adjourned until 2 00 P M with the understanding that consideration of the proposed publication would be the order of business

(Afternoon Session)

The attendance was the same as for the morning session

By request, the secretary reviewed the reports of the Special Committee on YEAR BOOK in which it was recommended that a popular publication should be established, the consideration given the recommendation since that time, especially at the last annual meeting, and the information about cost, size and character of the publication as submitted to the Committee on Publications

The subject was discussed at length but the data available was not believed to be sufficient for definite action

(*Motion No 20*) It was moved by Swain Costello and carried that the chairman appoint a Committee on Ways and Means to study the financing, and a Committee on Contents, Scope and Style to study the character of the proposed publication, both committees to be requested to report within three months

61 *Committee on Pharmacy Week* Chairman Hogstad appeared to present a series of recommendations with respect to the future conduct of Pharmacy Week which were generally discussed
